At this period the state of the Byzantine Empire was such as to render its powers of resistance insignificant; indeed the length of time during which it held out against the Turks is to be attributed rather to the lack of efficacious means at the disposal of its assailants than to any qualities possessed by its defenders. In Constantinople itself sedition and profligacy were rampant, the emperors were the tools of faction and cared but little for the interests of their subjects, whose lot was one of hopeless misery and depravity. On the death of the emperor Andronicus III. in 1341 he was succeeded by John Palaeologus, a minor; and Cantacuzenus, the mayor of the palace, appealed to Orkhan for assistance to supplant him, giving in marriage to the Ottoman prince his daughter Theodora. Orkhan lent the desired aid; his son Suleiman Pasha, governor of Karassi, crossed into Europe, crushed Cantacuzenus's enemies, and penetrated as far as the Balkans, returning laden with spoil. Thus the Turks learnt the country of the Greeks and their weakness. In 1355 Suleiman crossed over from Aīdinjik and captured the fortress of Gallipoli, which was at once converted into a Turkish stronghold; from this base Bulaīr, Malgara, Ipsala and Rodosto were added to the Turkish possessions. Suleiman Pasha was killed by a fall from his horse near Bulaīr in 1358; the news so affected his father Orkhan as to cause his death two months later. The institution of the Janissaries (*q.v.*) holds a prominent place among the most remarkable events of Orkhan's reign, which was notable for the encouragement of learning and the foundation of schools, the building of roads and other works of public utility.

Orkhan was succeeded by his son Murad. After capturing Angora from a horde of Turkomans encamped there who were attacking his dominions, at first with some success, in 1361 Murad prepared for a campaign in Europe. At that time the Greek emperor's rule was confined to the shores of the Marmora, the Archipelago and Thrace. Salonica, Thessaly, Athens and the Morea were under independent Greek princes. The Bulgarians, Bosnians and Servians had at different periods invaded and conquered the territories inhabited by them; the Albanians, original natives of their land, were governed by princes of their own. When, on the death of Cantacuzenus, John Palaeologus remained sole occupant of the imperial throne, Murad declared war against him and conquered the country right up to Adrianople; the capture of this city, the second capital of the emperors, was announced in official letters to the various Mussulman rulers by Murad. Three years later, in 1364, Philippopolis fell to Lala Shahin, the Turkish commander in Europe. The states beyond the Balkan now began to dread the advance of the Turks; at the instigation of the pope an allied army of 60,000 Serbs, Hungarians, Walachians and Moldavians attacked Lala Shahin. Murad, who had returned to Brusa, crossed over to Biga, and sent on Haji Ilbeyi with 10,000 men; these fell by night on the Servians and utterly routed them at a place still known as the "Servians' coffer." In 1367 Murad made Adrianople his capital and enriched it with various new buildings. He continued to extend his territories in the north and west; the king of Servia and the rulers of Kiustendil, Nicopolis and Silistria agreed to pay tribute to the conquering Turk. Lala Shahin Pasha was appointed feudal lord of the district of Philippopolis, and Timur Tash Pasha became beylerbey of Rumelia; Monastir, Perlepē, and parts of Bosnia and Herzegovina were next taken, and the king of Servia consented to furnish to Murad a fixed contingent of auxiliary troops, besides paying a money tribute. In 1381 Murad's son Yilderim Bayezid married Devlet Shah Khatun,

Murad I, 1359–1389.

daughter of the prince of Kermian, who brought him in dowry Kutaiah and its six dependent provinces. In the same year Bey Shehr and other portions of the Hamid principality were acquired by purchase from their ruler Hussein Bey, as the Karamanian princes were beginning to cast covetous eyes on them; but the Karamanians were unwilling to resign their claims to be heirs of the Seljukian sultans, and not until the reign of Mahommed II. were they finally suppressed. Ali Bey, the prince at this time, took advantage of Murad's absence in Europe to declare war against him; but the Ottoman ruler returning crushed him at the battle of Konia. Meanwhile the king of Bosnia, acting in collusion with the Karamanian prince, attacked and utterly defeated Timur Tash Pasha, who lost 15,000 out of an army of 20,000 men. The princes and kings who had consented to pay tribute were by this success encouraged to rebel, and the Servian troops who had taken part in the battle of Konia became insubordinate. Indignant at the severity with which they were punished, Lazarus, king of Servia, joined the rebel princes. Murad thereupon returned to Europe with a large force, and sent Chenderēli Zadē Ali Pasha northwards; the fortresses of Shumla, Pravadi, Trnovo, Nicopolis and Silistria were taken by him; Sišman III., rebel king of Bulgaria, was punished and Bulgaria once more subjugated. Ali Pasha then joined his master at Kossovo. Here Lazarus, king of Servia, had collected an army of 100,000 Serbs, Hungarians, Moldavians, Walachians and others. On the 27th of August 1389 the greatest of the battles of Kossovo was fought. A lightning charge of Yilderim Bayezid's dispelled the confidence of the enemy, scattering death and dismay in their ranks. The king of Servia was killed and his army cut to pieces, though the Turks numbered but 40,000 and had all the disadvantage of the position. After the battle, while Murad was reviewing his victorious troops on the field, he was assassinated by Milosh Kabilovich, a Servian who was allowed to approach him on the plea of submission.

Murad maintained a show of friendly relations with the emperor John Palaeologus, while capturing his cities. A review held by him in 1387 at Yeni Shehr was attended by the emperor, who, moreover, gave one of his daughters in marriage to Murad and the other two to his sons Bayezid and Yakub Chelebi. These princes were viceroys of Kermian and Karassi respectively; the youngest son, Sauji Bey, governed at Brusa during his father's absence. Led away by evil counsellors, Sauji Bey plotted with Andronicus, son of the emperor, to dethrone their respective fathers. The attempt was foiled; Andronicus was blinded by his father's orders and Sauji was put to death (1387).

Bayezid I., 1389–1403.

After being proclaimed on the field of Kossovo, Bayezid's first care was to order the execution of his brother Yakub Chelebi, and so to preclude any repetition of Sauji's plot. The young prince Andronicus, who had not been completely blinded, sent secretly to Bayezid and offered him 30,000 ducats to dethrone his father John Palaeologus and make him emperor. Bayezid consented; later on John Palaeologus offered an equivalent sum and, since he engaged to furnish an auxiliary force of 12,000 men into the bargain, Bayezid replaced him on the throne. By the aid of these auxiliaries the fort of Ala Shehr was captured (1392), Manuel Palaeologus, son of the emperor, being allowed, in common with many other princes, the privilege of serving in the Turkish army, then the best organized and disciplined force extant. The principalities of Aīdin, Menteshē, Sarukhan and Kermian were annexed to Bayezid's dominions to punish their rulers for having joined with the Karamanian prince in rebellion. The exiled princes took refuge with the Kizil Ahmedli, ruler of Kastamuni, who persuaded the Walachians to rebel against the Turks. By a brilliant march to the Danube Bayezid subjugated them; then returning to Asia he crushed the prince of Karamania, who had made head again and had defeated Timur Tash Pasha. Bayezid now consolidated his Asiatic dominions by the capture of Kaisarieh, Sivas and Tokat from Tatar invaders, the relics of Jenghiz Khan's hordes. Sinope, Kastamuni and Samsun were surrendered by the prince of Isfendiar, and the conquest of Asia Minor seemed assured.

On the death of John Palaeologus in 1391 his son Manuel, who was serving in the Turkish army, fled, without asking leave, to Constantinople, and assumed the imperial dignity. Bayezid determined to punish this insubordination: Constantinople was besieged and an army marched into Macedonia, capturing Salonica and Larissa (1395). The siege of the capital was, however, unsuccessful; the pope and the king of Hungary were able to create a diversion by rousing the Christian rulers to a sense of their danger. An army of crusaders marched upon the Turkish borders; believing Bayezid to be engaged in the siege of Constantinople, they crossed the Danube without precaution and invested Nicopolis. While the fortress held out with difficulty Bayezid fell upon the besiegers like a thunderbolt. The first onslaught of the Knights of the Cross did indeed rout the weak irregulars placed in the van of the Turkish army, but their mad pursuit was checked by the steady ranks of the Janissaries, by whom they were completely defeated (1396). King Sigismund of Hungary barely escaped in a fishing boat; his army was cut to pieces to a man; among the prisoners taken was Jean Sans Peur, brother of the king of France. To the usual letter announcing the victory the caliph in Egypt replied saluting Bayezid with the title of "Sultan of the lands of Rum."

After the victory of Nicopolis the siege of Constantinople was resumed, and the tower of Anatoli Hissar, on the Asiatic side of the Bosporus, was now built. However, by sending heavy bribes to Bayezid and his vizier, and by offering to build a mosque and a Mussulman quarter, and to allow Bayezid to be named in the weekly prayer, Manuel succeeded in inducing Bayezid to raise the siege. The mosque was destroyed later on and the Mussulman settlers driven out. Between 1397 and 1399 Bayezid overran Thessaly, while in Asia his lieutenant Timur Tash was extending his conquests. Meanwhile Timur (Tamerlane) had started from Samarkand on his victorious career. With incredible rapidity his hosts spread and plundered from Bagdad to Moscow. After devastating Georgia in 1401 he marched against the Turks. Some of the dispossessed princes of Asia Minor had repaired to Timur and begged him to reinstate them; accordingly Timur sent to Bayezid to request that this might be done. The tone of the demand offended Bayezid, who rejected it in terms equally sharp. As a result Timur's countless hordes attacked and took Sivas, plundering the town and massacring its inhabitants. Then, to avenge an insult sustained from the ruler of Egypt, Timur marched southwards and devastated Syria, thence turning to Bagdad, which shared the same fate. He then retraced his steps to the northwest. Bayezid had taken advantage of his absence to defeat the ruler of Erzingan, a protégé of Timur. All attempts to arrange a truce between the two intractable conquerors were in vain. They met in the neighbourhood of Angora. Timur's army is said to have numbered 200,000, Bayezid's force to have amounted to about half that figure, mostly seasoned veterans. The sultan's five sons were with the army, as well as all his generals; 7000 Servian auxiliaries under Stephen, son of Lazarus, took part in the battle (1402). Prodigies of valour on the part of Bayezid's troops could not make up for the defection of the newly-absorbed levies from Aīdin, Sarukhan and Menteshē who went over to their former princes in Timur's camp. The rout of the Turkish army was complete. Bayezid, with many of his generals, was taken prisoner. Though treated with some deference by his captor, who even promised to reinstate him, Bayezid's proud spirit could not endure his fall, and he died eight months later at Ak Shehr.

Interregnum, 1403–1413.

After the disaster of Angora, from which it seemed impossible that the Ottoman fortunes could ever recover, the princes fled each with as many troops as he could induce to follow him, being hotly pursued by Timur's armies. Only Mussa was captured. Timur reached Brusa, and there laid hands on the treasure of Bayezid; one after another the cities of the Turks were seized and plundered by the Tatars. Meanwhile Timur sent letters after the fugitive sons of Bayezid promising to confer on them their father's dominions, and protesting that his attack had been due merely to the insulting tone adopted towards him by Bayezid and to the entreaties of the dispossessed princes of Asia Minor. Most of the latter were reinstated, with the object of reducing the Turkish power. Timur did not cross into Europe, and contented himself with accepting some trifling presents from the Greek emperor. After capturing Smyrna he returned to Samarkand (1405). Some years of strife followed between the sons of Bayezid, in which three of them fell; Mussa, seizing Adrianople, laid siege to Constantinople, and Manuel Palaeologus, the emperor, appealed for aid to Mahommed, the other son, who had established himself at Brusa.

Mahommed I., 1413-1421.

In 1413 Mahommed defeated Mussa, and thus remained sole heir to Bayezid's throne; in seven or eight years he succeeded in regaining all the territories over which his father had ruled, whereas Timur's empire fell to pieces at the death of its founder. Two years after his accession Mahommed overcame a rebellion of the prince of Karamania and recaptured his stronghold Konia (1416), and then, turning northwards, forced Mircea, voivode of Walachia, who in the dispute as to the succession had supported Prince Mussa, to pay tribute. The Turkish dominions in Asia Minor were extended, Amasia, Samsun and Janik being captured, and an insurrection of dervishes was quelled. In 1421 the sultan died. His services in the regeneration of the Turkish power can hardly be over-estimated; all agree in recognizing his great qualities and the charm of his character; even Timur is said to have admired him so much as to offer him his daughter in marriage. The honour was declined, and Mahommed took a bride from the house of Zulfikar. Amid the cares of state he found time for works of public utility and for the support of literature and art; he is credited with having sent the first embassy to a Christian power, after the Venetian expedition to Gallipoli in 1416, and the Ottoman navy is first heard of in his reign.

Murad II., 1421-1451.

At the time of Mahommed's death his eldest son Murad was at Amasia; and, as the troops had lately shown signs of insubordination, it was deemed advisable to conceal the news of the sultan's death and to send a part of the army across to Asia. The men, however, refused to march without seeing their sultan, and the singular expedient was resorted to of propping up the dead monarch's body in a dark room and concealing behind it an attendant who raised the hands and moved the head of the corpse as the troops marched past. Shortly after Murad's accession the emperor Manuel, having applied in vain for the renewal of the annual subsidy paid him by the late sultan for retaining in safe custody Mustafa, an alleged son of Bayezid, released the pretender. Adherents flocked to him, and for a whole year Murad was engaged in suppressing his attempts to usurp the throne.

At last the armies of sultan and pretender met at Ulubad (Lopadion) on the Rhyndacus in Asia Minor; Mustafa's troops fled at the first onset; Lampsacus, where the pretender took refuge, was captured with the aid of the Genoese galleys under Adorno. Mustafa, who had crossed the strait and fled northwards, was taken, brought to Adrianople, and hanged from a tower of the serai (1422). Murad now laid siege to Constantinople to avenge himself on the emperor, and on the 24th of August the desperate valour of the defenders succeeded in driving back an assault led by a band of fanatical dervishes. The siege was raised, however, not owing to the bravery of the defence, but because the appearance of another pretender, in the person of Murad's thirteen-year-old brother Mustafa, under the protection of the revolted princes of Karamania and Kermian, called the sultan to Asia. Mustafa, delivered up by treachery, was hanged (1424); but Murad remained in Asia, restoring order in the provinces, while his lieutenants continued the war against the Greeks, Albanians and Walachians. By the treaty signed on the 22nd of February 1424, shortly before his death, the emperor Manuel II., in order to save the remnant of his empire, agreed to the payment of a heavy annual tribute and to surrender all the towns on the Black Sea, except Selymbria and Derkos, and those on the river Strymon. Peace was also made at the same time with the despot of Servia and the voivode of Walachia, on the basis of the payment of tribute. By 1426 the princes of Kermian and Karamania had submitted on honourable terms; and Murad was soon free to continue his conquests in Europe. Of these the most conspicuous was that of Salonica. Garrisoned only by 1500 Venetians, the city was carried by storm (March 1, 1428); the merciful precedent set by Mahommed I. was not followed, the greater part of the inhabitants being massacred or sold into slavery, and the principal churches converted into mosques.

The capture of Salonica had been preceded by renewed troubles with Servia and Hungary, peace being concluded with both in 1428. But these treaties, each of which marked a fresh Turkish advance, were short-lived. The story of the next few years is but a dismal record of aggression and of reprisals leading to fresh aggression. In 1432 the Turkish troops plundered in Hungary as far as Temesvár and Hermannstadt, while in Servia Semendria was captured and Belgrade invested. In Transylvania, however, the common peril evoked by the Turkish incursion and a simultaneous rising of the Vlach peasantry had knit together the jarring interests of Magyars, Saxons and Szeklers, a union which, under the national hero, the voivode János Hunyadi (*q.v.*), was destined for a while to turn the tide of war. In 1442 Hunyadi drove the Turks from Hermannstadt and, at the head of an army of Hungarians, Poles, Servians, Walachians and German crusaders, succeeded in the ensuing year in expelling them from Semendria, penetrating as far as the Balkans, where he inflicted heavy losses on the Turkish general. Meanwhile, again confronted by a rebellion of the prince of Karamania, Murad had crossed into Asia and reduced him to submission, granting him honourable terms, in view of the urgency of the peril in Europe. On the 12th of July 1444 a ten years' peace was signed with Hungary, whereby Walachia was placed under the suzerainty of that country; and, wearied by constant warfare and afflicted by the death of his eldest son, Prince Ala-ud-din, Murad abdicated in favour of his son Mahommed, then only fourteen years of age, and retired to Magnesia (1444). The pope urged the king of Hungary to take advantage of this favourable opportunity by breaking the truce solemnly agreed upon, and nineteen days after it had been concluded a coalition was formed against the Turks; a large army headed by Ladislaus I., king of Hungary, Hunyadi, voivode of Walachia, and Cardinal Cesarini crossed the Danube and reached Varna, where they hoped to be joined by the Greek emperor. In this emergency Murad was implored to return to the throne; to a second appeal he gave way, and crossing over with his Asiatic army from Anatoli Hissar he hastened to Varna. The battle was hotly contested; but, in spite of the prowess of Hunyadi, the rout of the Christians was complete; the king of Hungary and Cardinal Cesarini were among the killed. Murad is said to have abdicated a second time, and to have been again recalled to power owing to a revolt of the Janissaries. In 1446 Corinth, Patras and the north of the Morea were added to the Turkish dominions. The latter years of Murad's reign were troubled by the successful resistance offered to his arms in Albania by Scanderbeg (*q.v.*). In 1448 Hunyadi, now governor of Hungary, collected the largest army yet mustered by the Hungarians against the Turks, but he was defeated on the famous field of Kossovo and with difficulty escaped, while most of the chivalry of Hungary fell. Little more than two years later Murad died at Adrianople, being succeeded by his son Mahommed.

Mahommed II. the Conqueror, 1451-1481.

After suppressing a fresh revolt of the prince of Karamania, the new sultan gave himself up entirely to the realization of the long-cherished project of the conquest of Constantinople. He began by building on the European side of the Bosporus the fort known as Rumeli Hissar, opposite that built by his grandfather Bayezid. Tradition avers that but forty days were needed for the completion of the work, six thousand men being employed night and day; guns and troops were hurriedly put in, and all navigation of the Bosporus was stopped. After completing his preparations, which included the casting of a monster cannon and the manufacture of enormous engines of assault, Mahommed began the siege in 1453. Constantine Palaeologus, the last occupant of the imperial throne, took every measure that the courage of despair could devise for the defence of the doomed city; but his appeal to the pope for the aid of Western Christendom was frustrated through the bigoted, anti-Catholic spirit of the Greeks. The defenders were dispirited and torn by sedition and dissensions, and the emperor could rely on little more than 8000 fighting men, while the assailants, 200,000 strong, were animated by the wildest fanatical zeal. The siege had lasted fifty-three days when, on the 29th of May 1453, a tremendous assault was successful; the desperate efforts of the Greeks were unavailing, Constantine himself falling among the foremost defenders of the breach. The sultan triumphantly entered the palace of the emperors, and the next Friday's prayer was celebrated in the church of St Sofia (see ROMAN EMPIRE, LATER).

After some days' stay in Constantinople, during which he granted wide privileges to the Greeks and to their patriarch, the sultan proceeded northwards and entirely subdued the southern parts of Servia. A siege of Belgrade was unsuccessful, owing to the timely succour afforded by Hunyadi (1456). Two years later internal dissensions in Servia brought about the conquest of the whole country by the Turks, only Belgrade remaining in the hands of the Hungarians. The independent princes of Asia Minor were now completely subjugated and their territories finally absorbed into the Turkish dominions; Walachia was next reduced to the state of a tributary province. Venice having adopted a hostile attitude since Turkey's conquests in the Morea, greater attention was devoted to the fleet; Mytilene was captured and the entrance to the straits fortified. The conquest of Bosnia, rendered necessary by the war with Venice, was next completed, in spite of the reverses inflicted on the Turks by the Hungarian king Matthias Corvinus, the son of János Hunyadi. The Turks continued to press the Venetians by land and sea; Albania, which under Scanderberg had for twenty-five years resisted the Ottoman arms, was overrun; and Venice was forced to agree to a treaty by which she ceded to Turkey Scutari and Kroïa, and consented to pay an indemnity of 100,000 ducats (Jan. 25, 1478). The Crimea was next conquered and bestowed as a tributary province on the Tatar khan Mengli Girai. Mahommed now endeavoured to strike a blow at Rhodes, the stronghold of the Knights of St John, preparatory to carrying out his long-cherished plan of conquering Italy. A powerful naval expedition was fitted out, but failed, an armistice and treaty of commerce being signed with the grand master, Pierre d'Aubusson (1479). But a land attack on southern Italy at the same time was successful, Otranto being captured and held for a time by the Turks. In 1481 the sultan was believed to be projecting a campaign against the Circassian rulers of Syria and Egypt, when he died at Gebzé. He is said to have been of a merry and even jocular disposition, to have afforded a generous patronage to learning, and, strange to say for a sultan, to have been master of six languages.

Mahommed II. was the organizer of the fabric of Ottoman administration in the form which it retained practically unchanged until the reforms of Mahmud II. and Abd-ul-Mejid. He raised the regular forces of the country to a total exceeding 100,000; the pay of the Janissaries was by him increased, and their ranks were brought up to an effective of upwards of 12,000. He established the system whereby the lands conquered by the arms of his troops were divided into the different classes of fiefs, or else assigned to the maintenance of mosques, colleges, schools and charitable institutions, or converted into common and pasturage lands. Many educational and benevolent foundations were endowed by him, and it is to Mahommed II. that the organization of the ulema, or legist and ecclesiastical class, is due.

Bayezid II., 1481-1512.

Upon Bayezid II. succeeding to his father a serious revolt of the troops took place, which led to the institution of the regular payment of an accession donative to the Janissaries. At the outset of the reign Bayezid's brother, Prince Jem, made a serious attempt to claim the throne; he was defeated, and eventually took refuge with the knights of Rhodes, whom Bayezid bribed to keep him in safe custody. The unfortunate prince was led from one European stronghold to another, and, after thirteen years' wandering, died at Naples in 1494 (see BAYEZID II.). Freed from the danger of his brother's attacks, the sultan gave himself up to devotion, leaving to his ministers the conduct of affairs in peace and war. But, though of an unambitious and peace-loving temper, the very conditions of his empire made war inevitable. Even when peace was nominally in existence, war in its most horrible forms was actually being waged. On the northern frontier border raids on a large scale were frequent. Thus, in 1492 the Turks made incursions into Carinthia as far as Laibach, and into Styria as far as Cilli, committing unspeakable atrocities; in 1493 they overran both Styria and Croatia. The Hungarians retaliated in kind, burning and harrying as far as Semendria, torturing and murdering, and carrying off the saleable inhabitants as slaves. In 1494 a crushing victory of the emperor Maximilian drove the Turks out of Styria, which they did not venture again to invade during his reign. In 1496 the temporary armistice between the Poles and Turks, renewed in 1493, came to an end, and John Albert, king of Poland, seized the occasion to invade Moldavia. The efforts of Ladislaus of Hungary to mediate were vain, and the years 1497 and 1498 were marked by a terrible devastation of Poland by the Ottomans; only the bitter winter, which is said to have killed 40,000 Turks, prevented the devastation from being more complete. By the peace concluded in 1500 the sultan's dominions were again extended. Meanwhile, in June 1499, war had again broken out with Venice, mainly owing to the intervention of the pope and emperor, who, with Milan, Florence and Naples, urged the sultan to crush the republic. On the 28th of July the Turks gained over the Venetians at Sapienza their first great victory at sea; and this was followed by the capture of Lepanto, at which Bayezid was present, and by the conquest of the Morea and most of the islands of the archipelago. By the peace signed on the 24th of December 1502, however, the *status quo* was practically restored, the sultan contenting himself with receiving Santa Maura in exchange for Cephalonia.

Meanwhile in Asia also the Ottoman Empire had been consolidated and extended; but from 1501 onwards the ambitious designs of the youthful Shah Ismail in Persia grew more and more threatening to its security; and though Bayezid, intent on peace, winked at his violations of Ottoman territory and exchanged friendly embassies with him, a breach was sooner or later inevitable. This danger, together with the growing insubordination of the aged sultan's sons, caused his ministers to urge him to abdicate in favour of Selim, the younger but more valiant. This prince pushed his audacity so far as to attack his father's troops, but the action merely increased his popularity with the Janissaries, and Bayezid, after a reign of thirty-one years, was obliged to abdicate in favour of his forceful younger son; a few days later he died. This reign saw the end of the Mussulman rule in Spain, Turkey's naval power not being yet sufficient to afford aid to her co-religionists. It also saw the first intercourse between a Russian tsar and an Ottoman sultan, Ivan III. exchanging in 1492 friendly messages with Bayezid through the Tatar khan Mengli Girai; the first Russian ambassador appeared at Constantinople three years later.

Selim I., 1512-1520.

When he had ruthlessly quelled the resistance offered to his accession by his brothers, who both fell in the struggle for the throne, Selim undertook his campaign in Persia, having first extirpated the Shia heresy, the prevalent sect of Persia, in his dominions, where it threatened to extend. After an arduous march and in spite of the mutinous behaviour of his troops, Selim, crushed the Persians at Chaldiran (1515) and became master of the whole of Kurdistan. He next turned against the Mameluke rulers of Egypt, crushed them, and entering Cairo as conqueror (1517), obtained from the last of the Abbasid caliphs,[1] Motawakkil, the title of caliph (*q.v.*)

[1] After the fall of the caliphs of Bagdad (1258), descendants of the Abbasids took refuge in Cairo and enjoyed a purely titular authority under the protection of the Egyptian rulers.

for himself and his successors (see EGYPT: *History; Mahommedan Period*). The sultan also acquired from him the sacred banner and other relics of the founder of Islam, which have since been preserved in the Seraglio at Constantinople. Egypt, Syria and the Hejaz, the former empire of the Mamelukes, were added to the Ottoman dominions. Towards the end of Selim's reign the religious revolt of a certain Jellal, who collected 200,000 adherents, was the cause of much trouble; but he was eventually routed and his force dispersed near Tokat. While preparing an expedition against Rhodes to avenge the repulse sustained forty years before by Mahommed II., the sultan died at Orash-keui, near Adrianople, at the spot where he had attacked his father's troops. His reign of eight years had almost doubled the extent of the Turkish dominions.

Suleiman I., 1520–1566.

He was succeeded by his son Suleiman "the Magnificent," in whose long and eventful reign Turkey attained the highest point of her glory. Selim's Asiatic conquests had left his successor free to enter upon a campaign in Europe, after the suppression of a revolt of the governor of Damascus, who had thought to take advantage of the new sultan's accession to restore the independent rule of the Circassian chiefs. In 1521 war was declared against the king of Hungary on the pretext that he had sent no congratulations on Suleiman's accession. Belgrade was besieged and captured, a conquest which Mahommed II. had failed to effect. In the next year an expedition was undertaken against Rhodes, the capture of which had become doubly important since the acquisition of Egypt. The siege, which was finally conducted by the sultan in person, was successful after six months' duration; the forts of Cos and Budrum were also taken. The European war was now renewed; in 1526 the sultan, marching from Belgrade, crossed the Danube and took Peterwardein and Esseg; on the field of Mohács he encountered and defeated the Hungarians under king Louis II., who was killed with the flower of the Hungarian chivalry (see HUNGARY: *History*). Budapest hereupon fell to the Turks, who appointed John Zápolya king of Hungary (1528). But the crown of Hungary was claimed by the archduke Ferdinand, brother of the emperor Charles V., as being king Louis's brother-in-law. This brought Turkey into collision with the great emperor. Moreover, Francis I. of France, who had just been defeated by Charles, sent to the sultan ambassadors and messages dwelling on the danger of allowing Charles's power to become too great, and imploring the assistance of Suleiman as the only means of preserving the balance of power in Europe. Meanwhile Ferdinand's troops captured Budapest, driving out Zápolya, who at once appealed to Suleiman for aid. Suleiman decided against Charles, and marched north (1529). Zápolya joined the Turks at Mohács, and a joint attack was made on Budapest. After five days' siege the Austrians were driven out, and Zápolya was reinstated on the throne of Hungary. The Turks then marched on Vienna, which was bombarded and closely invested, but so valiant was the resistance offered that after three weeks the siege was abandoned (Oct. 14, 1529). Suleiman now prepared for a campaign in Germany and sought to measure himself against Charles, who, however, withdrew from his approach, and little was done save to ravage Styria and Slavonia. In 1533 a truce was arranged, Hungary being divided between Zápolya and Ferdinand.

During the Hungarian campaign the Shia sectaries had been encouraged to revolt, and the Persians had overrun Azerbāijān and recaptured Tabriz. Suleiman, therefore, turned his arms against them, reaching Bagdad in 1534, and capturing the whole of Armenia. The naval exploits of Khair-ed-din Pasha (see BARBAROSSA) are among the glories of the reign, and led to hostilities with Venice. After capturing Algiers, an attack by this famous admiral on Tunis was repulsed with the aid of Spain, but in the Mediterranean he maintained a hotly-contested struggle with Charles's admiral, Andrea Doria. Venice was in alliance with Charles, and her possessions were consequently attacked by Turkey by land and by sea, many islands, including Syra and Tinos, falling before Barbarossa's assaults. Corfu was besieged, but unsuccessfully. At Preveza Barbarossa defeated the papal and Venetian fleets under Doria. In 1540 the fort of Castelnuovo, the strongest point on the Dalmatian coast, was taken by the Venetians and recaptured by Barbarossa. Peace was then made on the terms that Turkey should retain her conquests and Venice should pay an indemnity of 300,000 ducats. Friendly relations had subsisted between Suleiman and Ferdinand during the expedition to Persia; but on the death of Zápolya in 1539 Ferdinand claimed Hungary and besieged Budapest with a large force. Suleiman determined to support the claims of Zápolya's infant son, John Sigismund, and in 1541 set out in person. At the end of August he appeared before Budapest, the siege of which had already been raised by the defeat of the Austrians; the infant John Sigismund was carried into the sultan's camp, and the queen-mother, Isabella, was peremptorily ordered to evacuate the royal palace, though the sultan gave her a diploma in which he swore only to retain Budapest during the minority of her son. On the 2nd of September Suleiman entered the city, and to the ambassadors of Ferdinand, who came to offer a yearly sum if the sultan would recognize his claim to Hungary, he replied that he had taken possession of it by the sword and would negotiate only after the surrender of Gran, Tata, Visegrád and Székesfehérvár. The war now continued vigorously by sea and land. The great expedition of the emperor Charles V. against Algiers ended in failure, his fleet being destroyed by a sudden storm (Oct. 31, 1541); and his diplomatic efforts to wean Barbarossa from his allegiance to the sultan fared no better. In 1542 a formal alliance was concluded between Suleiman and Francis I.; the Ottoman fleet was placed at the disposal of the king of France, and in August 1543, the Turks under Barbarossa, and the French under the duke of Enghien, laid siege to Nice. The town surrendered; but the citadel held out until, on the 8th of September, it was relieved by Andrea Doria. Meanwhile on land Suleiman had taken full advantage of the European situation to tighten his grip on Hungary. The attempt of the imperialists, under Joachim of Brandenburg, to retake Budapest (September 1542), failed ignominiously; and in the following year Suleiman in person conducted a campaign which led to the conquest of Siklós, Gran, Székesfehérvár and Visegrád (1544). Everywhere the churches were turned into mosques; and the greater part of Hungary, divided into twelve sanjaks, became definitively a Turkish province. A truce, on the basis of *uti possidetis*, signed at Adrianople on the 19th of June 1547 for five years, between the sultan, the emperor and Ferdinand I. king of Hungary, recognized the Turkish conquests in Hungary; while, for the portion left to him, Ferdinand consented to pay an annual tribute of 30,000 ducats. John Sigismund was recognized as independent prince of Transylvania and of sixteen adjacent Hungarian counties, Queen Isabella to act as regent during his minority.

Suleiman was now free to resume operations against Persia. In the spring of 1548 he set out on his eleventh campaign, which ended in the capture of Erzerum (August 16) and the conquest of Armenia and Georgia. But the Persian War dragged on, with varying fortune, for years, till after Suleiman had ravaged Persia it was concluded by the treaty—the first between shah and sultan—signed at Amasia on the 29th of May 1555.

Meanwhile the war in Hungary had been resumed. Neither side had been careful to observe the terms of the treaty of 1547; the Turkish pashas in Hungary had raided Ferdinand's dominions, while Ferdinand had been negotiating with Frater Geörgy (see MARTINUZZI) with a view to freeing Transylvania from the Ottoman suzerainty. When the sultan discovered that Martinuzzi, who was all-powerful in Transylvania, had actually arranged to hand over the country to Ferdinand, he threw the Austrian ambassador into prison, and in September 1551 sent an army, 80,000 strong, under Mahommed Sokolli over the Danube. Several forts, and the important town of Lippa on the Marosch, fell at once, and siege was laid to Temesvár. This was raised after two months, and Martinuzzi took advantage of the retirement of the Turks to raise an army and recapture Lippa. Before the surrender of the city, however, he was murdered by Ferdinand's orders on strong suspicion of treachery. The campaign of 1552 was disastrous for the Austrians; the Turks, under the command of Ahmed Pasha, defeated them at Szegedin and captured in turn Veszprém, Temesvár, Szolnok and other places. Their victorious career was only checked, in October, by the raising of the siege of Erlau. In the spring of 1553 the victories of the Persians called for the sultan's presence in the East; a truce for six months was now concluded between the envoys of Ferdinand and the pasha of Budapest, and Austrian ambassadors were sent to Constantinople to arrange a peace. But the negotiations dragged on without result; the war continued with hideous barbarities on both sides; and it was not until the 1st of June 1562 that it was concluded by the treaty signed at Prague by Ferdinand, now emperor. Suleiman kept the possessions he had won by the sword, Temesvár, Szolnok, Tata and other places in Hungary; Transylvania was assigned to John Sigismund, the Habsburg claim to interference being categorically denied; Ferdinand bound himself to pay, not only the annual tribute of 30,000 ducats, but all the arrears that had meanwhile accumulated. Even this treaty, however, was but an apparent settlement. A year passed before the Latin and Turkish texts of the treaty were harmonized; and meanwhile irregular fighting continued on all the borders. In 1564 Ferdinand died, and was succeeded by Maximilian II. The new emperor attacked Tokaj, which was in Turkish possession; the tribute had been allowed again to fall into arrears; and to all this was added that Mahommed Sokolli, the new grand vizier (1565), pressed for new war to wipe out the disgrace of the failure of the Ottoman attack on Malta (May-September 1565). In May 1566 the war broke out, Suleiman, now seventy-two years old, again leading his army in person. In August he laid siege to Szigetvár with 100,000 men; but on the 5th of September, while preparations were being made for a final assault, the sultan died. His death was, however, kept secret, and on the 8th the fortress fell.

The reign of Suleiman the Magnificent marked the zenith of the Ottoman power. At the time of his death the Turkish Empire extended from near the frontiers of Germany to the frontiers of Persia. The Black Sea was practically a Turkish lake, only the Circassians on the east coast retaining their independence; and as a result of the wars with Persia the whole Euphrates valley, with Bagdad, had fallen into the sultan's power, now established on the Persian Gulf. The Venetians had been driven from the Morea and the islands of the Archipelago; and, except a strip of the Dalmatian coast and the little mountain state of Montenegro, the whole of the Balkan peninsula was in Turkish hands. In the Mediterranean, Crete and Malta yet survived as outposts of Christendom; but the northern coasts of Africa from Egypt to Morocco acknowledged the supremacy of the sultan, whose sea power in the Mediterranean had become a factor to be reckoned with in European politics, threatening not only the islands, but the very heart of Christendom, Italy itself, and capable—as the alliance with France against Charles V. had shown—of being thrown with decisive weight into the balance of European rivalries.

The Turkish Sea Power.

The power of the Ottomans at sea was maintained during this period by a series of notable captains, such as Khair-ed-din and his son Hassan, Pialé, Torgud, Sali Reis and Piri Reis. Of these the two first are separately noticed (see BARBAROSSA). Pialé, a Croatian who had been brought up in the imperial harem and succeeded Sinan as capudan-pasha, crowned a series of victories over the galleys of Andrea Doria by the capture of the island of Jerba, off Tripoli (July 31, 1560). For this he was rewarded with the hand of one of the sultan's grand-daughters. He later became the second vizier of the empire, and, as a supporter of Sokolli, was in power till his death in 1575. Torgud, also the son of Christian parents, was a native of the sanjak of Mentesha in Asia Minor, and began his career as a soldier in the Ottoman sea service. After spending some time as a Genoese galley-slave, he turned corsair and became the terror of the Mediterranean coasts. He seized Mahdia, a strong post on a tongue of land about 43 m. south of Susa in Tunisia, and made this the centre of his piracies till, during his absence raiding the Spanish coasts, it was bombarded and destroyed by an expedition sent by Charles V. (September 10, 1550). Torgud was now summoned to Constantinople to answer for piracies committed on the friendly galleys of Venice; but he sailed instead to Morocco, and there for two years defied the sultan's authority. But Suleiman, who needed the aid of the corsairs against Malta, pardoned him, and he was given the command of the expedition against Tripoli, which he captured. He now turned against Corsica, captured Bastia (August 1553) and on his return to Constantinople, laden with booty and slaves, chastised the insurgent Albanians. He was rewarded by Suleiman with the governorship of Tripoli, which he held till his death. He was killed during the unsuccessful attack on Malta, which he commanded (1565). Sali Reis, also by birth a Christian of Asia Minor, was likewise successful as a corsair; he distinguished himself especially at the capture of Tunis, and succeeded Hassan Barbarossa as beylerbey of Algiers.

Other captains carried the Turkish arms down the Arabian and Persian gulfs far out into the Indian Ocean. Of these the most remarkable was Piri Reis, nephew of Kamil Reis, the famous corsair who, under Bayezid II., had swept the Aegean and Mediterranean. Piri sailed into the Persian Gulf, took Muscat, and laid siege to Ormuz. But the approach of the Portuguese fleet put him to flight; some of his vessels were wrecked; and on his return by way of Egypt he was arrested at Cairo and executed. He had compiled a sea-atlas (the *Bahrije*) of the Aegean and Mediterranean seas, every nook and cranny of which he had explored, with an account of the currents, soundings, landing-places, inlets and harbours.

Another literary seaman of this period was Sidi Ali, celebrated under his poetic pseudonym of Katibi (or Katibi Rumi, to distinguish him from the Persian poet of the same name). He was no more successful than Piri or his successor Murad in fighting the elements and the Portuguese in the Persian Gulf; but he was happier in his fate. Driven, with the remnant of his ships, into the Indian Ocean, he landed with fifty companions on the coast of India and travelled back to Turkey by way of Sind, Baluchistan, Khorassan and Persia. He wrote an account of this three years' journey, for which he was rewarded by Suleiman with an office and a pension. He was the author also of a mathematical work on the use of the astrolabe and of a book (*Muhit*, "the ocean") on the navigation of the Indian seas.

Reforms of Suleiman I.

At the close of Suleiman's reign the Turkish army numbered nearly 200,000 men, including the Janissaries, whose total he almost doubled, raising them to 20,000. He improved the laws and institutions established by his predecessors and adapted them to the requirements of the age; to him are due important modifications in the feudal system, aimed at maintaining the fiefs in a really effective condition. The codes of law were by him revised and improved, and he was the first sultan to enter into relations with foreign states. In 1534 Jean de La Forêt, a knight of St John of Jerusalem, came to Constantinople as first permanent French ambassador to the Porte, and in February 1535 were signed the first Capitulations (*q.v.*) with France.

Ottoman Polity in the 16th Century.

A short sketch of the administration and state of the country at this time may find place here. Successively transferred from Brusa to Adrianople and thence to Constantinople, the seat of government was at first little more than the camp of a conqueror. After the conquest of the imperial city the sultans began to adopt the pomp and splendour of eastern sovereigns, and largely copied the system, ready to hand, of the Byzantine emperors. Affairs of state were at first discussed at the imperial divan, where the great dignitaries were convened at appointed hours. Until the reign of Mahommed the Conqueror the sultan presided in person; but a rough Anatolian peasant penetrating one day to the council and exclaiming, "Which of you might be the sultan? I've come to make a complaint!" it was thought that in future it would be more consonant with the imperial dignity for the sovereign to remain concealed behind a grating where, unseen, he could hear all that was said. Towards the middle of Suleiman's reign even this practice was abandoned, and the sultans henceforth attended the divans only on the distribution of pay to the troops or the reception of a foreign ambassador, which occasions were usually made to coincide. The divan accompanied the sultan on military expeditions.

As established by Mahommed II., the officials of the state were divided into four classes: (1) administrative; (2) ecclesiastical; (3) secretarial and (4) military. The administration of *kazas*, or cantons, was usually entrusted to the cadis and the holders of the more important fiefs; the *sanjaks*, or departments, were ruled by *alaï beys* or *mir-i-livas* (colonels or brigadiers), pashas with one horse-tail; the *vilayets*, or provinces, by *beylerbeys* or *mir-i-mirans* (lord of lords), pashas with two horse-tails; these were all originally military officers, who, in addition to their administrative functions, were charged with the duty of mustering and commanding the feudal levies in war time. Above them were the beylerbeys of Anatolia and Rumelia, who served under the orders of the commander-in-chief. The title of vizier was borne by six or seven persons simultaneously; the grand vizier was the chief of these and exercised supreme authority, being invested with the sultan's signet. He often commanded an army in person, and was then given the title of *serdar-i-ekrem* (generalissimo); one of the subordinate viziers remained behind as *kaïmmakam*, or locum tenens. The duties of the other viziers were limited to attending the divan; they were called *kubbē* or cupola viziers from the fact that the council met under a cupola; they were pashas with three horse-tails, and were attended by large retinues, having generally achieved distinction as beylerbeys. These officers were usually chosen from among the more promising of the youths selected by the *devshurmē*, or system of forced levy for manning the ranks of the Janissaries: hence so many of the statesmen of Turkey were of non-Mussulman origin. Besides these members of the secretarial class, such as *nishanjis* and *defterdars*, as well as regular army officers, and occasionally members of the ecclesiastical class, or ulema, rose to the rank of vizier.

The highest dignitaries of the ecclesiastical class were at first the *kazaskers*, or military judges, of Europe and Asia; later the office of Sheikh-ul-Islam was created as the supreme authority in matters relating to the Church and the sacred law. Promotion was regular, but was obtainable only by entering at an early age one of the *medressēs* or colleges; the student, after passing through the successive degrees of *danishmend, mulazim* and *muderris*, became first a molla, then a judge, rising to the higher ranks as fortune and opportunity offered. In the time of Bayezid II. the post of *nakib-ul-eshrāf*, or registrar of the *sherīfs*, or descendants of the Prophet, was created.

The secretarial class consisted of six categories: the *nishanjis*, the *defterdars*, the *reïs*, the *defter emini*, the *shakk-i-sāni* (or second class) *defterdars* and the *shakk-i-sālis* (or third class) *defterdars*. The first named were charged with the duty of revising and duly executing the decisions of the divan respecting the assignment of lands to warriors and the apportioning of conquered territories. They were men of great culture, and many historians, poets and writers belong to this class. The *defterdar* was practically the minister of finance. The *reïs* was the secretary-general of the divan, and in more modern times became minister for foreign affairs. The *defter emini* kept the registers for the *nishanji*, whose place he took on emergency, the others acted as secretaries and clerks.

The military class was divided into two categories: (1) the regular paid troops who were quartered in barracks and were known as "slaves of the palace"; (2) the feudal levies who received no pay and were called upon to serve only in war-time. The Janissaries (*q.v.*) belonged to the first category. The rigid regulations for admission to their ranks were soon relaxed: at the close of the Persian war in 1590 their total amounted to 50,000. The regular troops comprised also armourers (*jebeji*), from 6000 to 8000 men, and six squadrons of cavalry; these were recruited in the same way as the Janissaries, and their numbers were raised by Murad III. to 20,000. There were also *bostanjis*, or forest-guards, numbering about 5000, besides local troops in distant and frontier provinces, and about 20,000 *akinjis*, or light troops, in Europe, who carried out forays in the enemies' country.

The fiefs were not hereditary, and were held directly from the sultan. On the conquest of a country the lands were apportioned by the *nishanjis*, who first computed the tithe revenue of each village, its population, woods, pasturage, &c.; and divided it into the three classes of *fiefs* (*khās, ziamet* and *timar*), or into *vakūf* (pious endowments) or pasturage. Any estate with a revenue exceeding 100,000 aspres was a khās, and was conferred on a prince or on a high dignitary as long as he held his post; for each 5000 aspres of revenue one armed warrior had to be furnished in war. Fiefs with a revenue of from 20,000 to 100,000 aspres were called ziamets and were conferred on similar terms on inferior officers, usually for life or during good behaviour. Fiefs with a revenue of from 3000 to 20,000 aspres were timars, furnishing one armed warrior for every 3000 aspres' revenue; the grant of a fief was conditional on obligatory residence. The peasants owning the land remained undisturbed in their proprietorship, paying to their feudal lord the tithe, as well as the fixed duties on transfer, &c. Abuses in the system first began in the time of Khosrev Pasha, Suleiman's grand vizier.

The governors of the more distant provinces enjoyed a considerable amount of independence, which in the case of the Barbary states was more or less complete; these entered into treaties with foreign powers, and by their piratical outrages frequently caused the Porte considerable embarrassment. The *sherīf* of the Hejaz, Abu-'l-berekāt, made submission to Sultan Selim I. After the subjugation of the Yemen, the absorption of the holy places was also attempted, and in Suleiman's reign judges were appointed thither from Constantinople. But it was found politic to continue the office of the grand *sherīf* of Mecca in the sherifian family.

The princes of the Crimea were invested with many of the prerogatives of independence, *e.g.* that of coining money; the ruler of Transylvania was allowed to retain the royal title, nor were Turkish troops quartered in the country. The Danubian principalities were also ruled by native princes until the Phanariote period (see PHANARIOTES).

Selim II., 1566–1574.

On the 17th of February 1568, two years after the accession of Suleiman's son Selim, peace was concluded with Austria on the basis of the former terms, the emperor Maximilian having sent ambassadors to congratulate the new sultan on his accession. A disastrous attack on Astrakhan, with the object of carrying out Sokolli's plan for uniting the Don and the Volga, first brought the Turks into collision with the Russians. Expeditions against the Yemen and Cyprus were successful, but the loss of Cyprus, accompanied as it was by the barbarous murder of the Venetian commander, Marco Antonio Bragadino, by the seraskier pasha Mustafa's orders, in violation of the terms of the capitulation of Famagusta (August 1571), roused the bitter resentment of the Venetians, previously incensed by Turkish raids on Crete. Already, on the 25th of May, had been concluded the holy league between the pope, Venice and Spain for a new crusade against the infidel, in spite of the efforts of France to prevent the adhesion of the republic. Preparations were hurried on and at the end of September the great allied fleet, under Don John of Austria, sailed into the archipelago. On the 7th of October was fought the naval battle of Lepanto, which broke for ever the tradition of the invincibility of the Turks at sea. The immediate results of the battle were not, however, as decisive as might have been expected. In June 1572 a fresh Ottoman fleet of 250 sail took the sea; and the jealousy of the allies and the incompetence of their commanders made any repetition of their former victory impossible. After a series of indecisive engagements Venice broke from the league and, under the mediation of France, concluded a treaty with the Porte practically on the basis of *uti possidetis* (March 7, 1573). With Spain the war continued, and on the 24th of August 1574 Tunis—which had been taken by Don John of Austria in 1572—was recaptured by the Turks, who from this new base proceeded, under Sinan Pasha and Kilij Ali, to ravage Sicily.[1] In the same year Selim II. died. Known in history as the "Sot," he had allowed his able grand vizier Mahommed Sokolli to rule the country.

Murad III., 1574–1595.

The character of Murad III., who succeeded his father Selim II. at the age of twenty-eight, was not calculated to arrest the progress of decay within the Ottoman Empire. He was a weakling, swayed by his favourites in the harem, especially by his Venetian wife Safié; and, though he kept Sokolli in office, he was suspicious of the too powerful vizier, whose wise influence he allowed his minions to undermine. Thus eminent servants of the state such as Mustafa Pasha, Sokolli's nephew—who for twelve years had ruled the sanjak of Budapest with conspicuous enlightenment and success—were deposed or executed to make way for the nominees of the harem. In even weightier matters the opinion of the grand vizier was slighted. Thus it was against his advice that, at the beginning of 1578, advantage was taken of the disorders arising on the death of Shah Tahmasp of Persia to attack

[1] It was ten years before a formal truce was signed with Spain (1584); two hundred years passed before the signature of a definitive treaty of peace and commerce (Sept. 14, 1782).

that country. The war lasted for twelve years, during which Tiflis, Shirvan and Daghestan were taken; finally Shah Abbas established himself on the Persian throne and in 1590 made peace with Turkey, who retained her conquests in Georgia, Azerbāijān and Shirvan. But this short-sighted policy is criticized by Turkish historians, who censure Murad III. for thus weakening the neighbouring Mussulman states such as Persia and Daghestan, thereby facilitating Russia's future expansion at their cost. Sokolli's assassination, on the 11th of October 1578, had meanwhile thrown the country into disorder. There was now no authority left to hold in check the corrupt influences of the harem. The avenues to power were through bribery and yet more unspeakable paths; the fiefs which formed the basis of the feudal array were bestowed on favourites' favourites, or sold to the highest bidder, and the sultan himself shared in the corrupt plunder. At last that final expedient of weak governments, the debasing of the coinage, led to a crisis. In 1589 mutinies of troops took place all over the empire, and in the two following years there were several risings of the Janissaries at Constantinople, the pretext being everywhere that the soldiers were being robbed of their pay. At this juncture a fresh crisis in the relations with Austria arose. The peace concluded in 1568 and thrice renewed (in 1573, 1576 and 1584) had not prevented the continuance of raids and forays, from either side of the frontier, that at times assumed the dimensions of regular campaigns. The climax came in 1593. All through the preceding year Hassan "Tilli," beylerbey of Bosnia, had raided in Croatia, taking border fortresses and driving off the inhabitants into slavery. In June 1593, with an army of 30,000 men, he laid siege to Sissek; the Austrian and Hungarian levies hurried to its relief; and on the 22nd the Turks were routed with immense slaughter on the banks of the Kulpa, Hassan himself, with many other beys and two of the imperial princes, being among the slain. Though not yet formally declared, the "long war" was now in full progress. In August, Sinan Pasha, the grand vizier—now eighty years of age—took command of the troops for the Hungarian War and left Constantinople, dragging with him the Austrian ambassador in chains. The capture of Veszprém and of Raab (1594) and the failure of the archduke Matthias to take Gran seemed to promise another rapid victory of the Ottoman arms; but Sinan was ill-supported from Constantinople, the situation was complicated by the revolt of Walachia and Moldavia, and the war was destined to last, with varying fortunes, for fourteen years. On the 16th of January 1595 Murad III. died.

In spite of the internal corruption which, under Murad III., heralded the decay of the empire, the prestige of the Ottomans in Europe was maintained during his reign. Even the emperor had to be content to be treated by the sultan as an inferior and tributary prince; while France had to suffer, with no more than an idle protest, the insult of the conversion of Catholic churches at Constantinople into mosques. In spite of frequent causes of friction, good relations were maintained with Venice, through the influence of the sultana Safié, and the capitulations with the republic of St Mark were renewed in 1589. Those with France were also renewed (July 6, 1581); and capitulations were signed for the first time with the grand duke of Tuscany (1578) and with England (1580).[1] In the following year permanent diplomatic relations were established by England with the Porte by the despatch of William Harebone as ambassador, Queen Elizabeth urging as her special claim to the sultan's friendship their common mission to fight "idolators."

Mahommed III., 1595–1603.

The new sultan, Mahommed III., Murad's son, succeeded to the throne at a moment when the Turkish arms were suffering reverses in Hungary and in the revolted Danubian provinces; the Janissaries, too, were ill-content and mutinous, and to put an end to their murmurings Mahommed was persuaded by Sinan Pasha to lead them to the war in person. The immediate effect was good; Erlau was captured in October 1596, and a three days' battle in the plain of Keresztes (Oct. 23 to 26) ended in the disastrous rout of the allied troops under the archduke Maximilian and Sigismund, prince of Transylvania. But the Turks did not profit much by their victory. The new grand vizier, Cicala, by his severity to the soldiers, mainly Asiatics, who had shown cowardice in the battle, drove thousands to desert; and the sultan, who had himself little stomach for the perils of campaigning, returned to Constantinople, leaving the conduct of the war to his generals. The campaign of 1598 began with the loss of Raab, and continued unfavourable to the Turks, who lost Totis, Veszprém and Pápa, and were hard pressed in Buda-pest. In October want of supplies and a mutiny of the Janissaries compelled the commander-in-chief to retreat into winter quarters at Belgrade. In 1599 the first peace overtures were made, but came to nothing; and the confused fighting of this and the following year culminated in the capture of Kanizsa by the Turks (September 1600). The attempt of the archduke Ferdinand, at the head of 30,000 men, to retake it a year later was defeated. In August 1602 Székesfehérvár again fell into the hands of the Turks; in November the siege of Buda by the archduke Matthias, who had taken Pest by storm, was raised by the grand vizier Hassan.

Trouble had, however, meanwhile broken out in other parts of the Ottoman dominions. The deserters from Cicala's army, distributed in armed bands throughout Asia Minor, had become centres round which all the elements of discontent gathered, and formed the mainstay of the Jellali sectaries who, at this time, rose in insurrection and ravaged Anatolia. In Constantinople, early in 1603, there was, moreover, a serious rising of the spahis; and, finally, in September Shah Abbas of Persia took advantage of what is known in Turkish history as "the year of insurrections" to declare war and reconquer Tabriz. In the midst of this crisis, on the 22nd of December 1603, Sultan Mahommed III. died, and was succeeded by his elder son, Ahmed I., a boy of fourteen.

Ahmed I., 1603–1617.

Though negotiations for peace were at once begun, it was not till three years after Ahmed's accession that the peace of Sitvatorok, concluded on the 11th of November 1606, at last put an end to the war in Europe. By this treaty the annual tribute payable by Austria was abolished, but an indemnity of 200,000 florins was paid "once for all" by the emperor, who was henceforth to be given his proper imperial title (padishah) in Turkish official documents. The peace of Sitvatorok (or Zeideva, as it is also called) marks the close of Turkey's period of conquest. No longer haughtily imposed on the vanquished, as was the case with former treaties, it was submitted to the examination and discussion of both parties before being signed. It freed Austria from the humiliating tribute to which the treaty of 1547 had subjected her, and established relations between the two monarchs on a footing of equality. It was thus the first manifest sign of Turkey's decadence from the glory of Suleiman I.'s reign, when King Ferdinand stooped to call the sultan's vizier his brother. For the remainder of the reign the Persian War was continued fitfully, a treaty of peace, signed in 1611, not being observed.

Mustafa I., 1617–1618 and Osman II., 1618–1622.

In 1617 the sultan died, and was succeeded by his brother Mustafa; but the latter being declared incompetent to reign, his brother Osman took his place on the throne. The war in Persia was terminated by the renewal in 1618 of the treaty of 1611, whereby all the conquests effected by Murad III. and Mahommed III. were given up. Peace, however, left the rebellious Janissaries leisure to engage in plots against the sultan, and in order to occupy them and to remove them from the capital advantage was taken of the king of Poland having intervened in the affairs of Transylvania and the principalities to declare war against him. Osman marched against Khotin, but failed to capture it, and his unpopularity with the army was increased by rumours that he designed to collect such troops as were loyal to him, under pretence of going on

[1] They were renewed with England in 1593, 1603, 1606, 1622, 1624, 1641, 1662 and 1675.

pilgrimage to Mecca, in order to destroy the Janissaries and reform the country. They therefore rose and dethroned him, soon afterwards putting him to death. For a few months Mustafa was replaced on the throne; when he abdicated in favour of his nephew Murad IV. Turkey seemed to be at the point of dissolution. Profiting by the mutiny of the army, the Persians invaded Turkey, capturing Bagdad; at Constantinople and in the provinces alike anarchy was everywhere prevalent. This continued until the new sultan had acquired age and experience; but, nine years after his accession, he successfully crushed the military rebels, and thereafter ruled with a severity amounting to bloodthirsty cruelty. In 1638 he marched in person against the Persians and succeeded in recapturing Bagdad. Peace was made in 1639, leaving the Turco-Persian frontier practically as it now stands. In the next year the sultan died at the age of thirty-one, being succeeded by his brother Ibrahim. In his reign the Cossacks were driven from Azov and the expedition against Crete was begun, the immediate cause being the plunder of a Turkish vessel by Maltese corsairs who took their capture to Crete. War was therefore declared against Venice, to whom Crete belonged (1644), and continued in the island for twenty-five years.

Mustafa I., 1622–1623, and Murad IV., 1623–1640.

Ibrahim, 1640–1648.

The anarchy and misgovernment of Turkey now reached such a pitch that Ibrahim was dethroned and murdered, and his son Mahommed IV. was proclaimed in his stead. For the first eight years of his reign successive grand viziers were unable to restore order to the country. In 1656 Mahommed Kuprili (*q.v.*) became grand vizier, and by dint of firmness and resolution repaired the falling fortunes of the country. The fleet was restored, and recaptured Lemnos and other islands which had passed into the hands of the Venetians; the revolts caused by Kuprili's severity were put down, and tranquillity was re-established in Transylvania. After five years' tenure of office the grand vizier died and was succeeded by his son, Ahmed Kuprili. In 1663 the disturbances which had broken out again in Transylvania led to war with Austria. Ahmed Kuprili attacked the Austrians, at first with success, but was routed by Montecuculi at the battle of St Gotthard Abbey and eventually consented to the treaty of Vasvár (Aug. 10, 1664), by which a twenty years' truce was agreed upon; Transylvania was evacuated by both parties, but remained tributary to Turkey. The Kuprilis, both father and son, had by their haughty and uncompromising demeanour done much to alienate the old-standing friendship with France, and at the battle of St Gotthard 6000 French, under Coligny, fought on the Austrian side. The result was that the Turks in retaliation deprived the Catholics, always under the protection of France, of some of their privileges in connexion with the holy places, which were now granted to the Orthodox Church. Meanwhile the Cretan campaign continued, and here also France lent her aid to the Venetians; this assistance could not, however, prevent the capture of Candia in 1669; on the 5th of September of that year Morosini, the Venetian commander, signed a treaty of peace with the Turks by which, after twenty-five years' warfare, they were placed in possession of the fortress of Candia, and with it of the effective rule over the whole island, Venice retaining only the fortresses of Suda, Grabusa and Spinalonga, and the islets along the coast.

Mahommed IV., 1648–1687.

Dissensions among the Cossacks led to the recognition by Turkey of Doroshenko, the hetman of the Sari Kamish, as ruler of the Ukraine; the Zaporog Cossacks, his antagonists, applied for aid to Russia. However, Michael Wiesnowiecki, king of Poland, considering the Ukraine as under his protection, sought to intervene, with the result that Turkey declared war against him (1672). The Turks captured Kamenets, Lemberg and Lublin. Hereupon the Poles sued for peace, and a treaty was signed at Buczacs (Oct. 18, 1672) whereby Podolia was ceded to Turkey, the Ukraine was left to the Cossacks, and Poland agreed to pay to Turkey an annual tribute of 22,000 sequins. But John Sobieski, who succeeded shortly afterwards to the throne of Poland, refused to abide by the terms of this treaty; the war was renewed and continued for four years, when the treaty of Buczacs was reaffirmed at Zuravno by both parties, the tribute clause alone being abrogated (Oct. 16, 1676). A few days later Ahmed Kuprili died.

Doroshenko now deserted the Turkish alliance for the Russian; in consequence an expedition was sent into the Ukraine which was both costly and useless. In 1678 the Turks succeeded in taking Cehrin, but their losses were very heavy, and on the 8th of January 1681 a treaty was signed at Radzyn whereby the territory in dispute was ceded to Russia. A revolt of the Hungarian Protestants, in consequence of the persecuting policy of the house of Habsburg, now led to a renewal of the war between Turkey and Austria, due in part to the overweening ambition of Kuprili's successor, Kara Mustafa, who desired to immortalize his tenure of office by some great exploit, and who cherished dreams of founding for himself a western Moslem Empire. The war is blamed by Turkish historians as unjustifiable and untimely, the country needing reform. A vast Turkish army marched to the walls of Vienna and closely beleaguered the imperial city, from which the emperor and his court fled. All hope seemed lost, when by a brilliant feat of arms John Sobieski, king of Poland, drove away the besiegers in hopeless confusion and saved the cause of Christianity, 1683. This was the signal for a general coalition against Turkey; Venice, Poland and the pope allied themselves with the Austrians; Russia, Tuscany and Malta joined in the attack. Turkey now sought for a *rapprochement* with France, and endeavoured to bring about her intervention in return for concessions as regards the holy places. But the French had just before bombarded Algiers and Tripoli, even menacing Chios (Scio), where some pirates had put in with French captives; and the mediation of France was not very actively exercised. One after another the Hungarian forts were captured by the Austrians; the Venetians were equally successful in Greece and the Morea; the Russians pressed on the Crimea, and Sobieski besieged Kamenets. The troops now mutinied and deposed the sultan, placing his brother Suleiman on the throne. But the disorder in the army and the administration continued, and the advance of the Austrians and the Venetians met with little opposition. In this emergency Mustafa Kuprili (*q.v.*) was appointed grand vizier (1689). His prudent measures at once re-established some degree of order in the army and the fleet, while he sought by a wise tolerance to improve the position and conciliate the sympathies of the non-Moslem subject races. At first eminently successful, he drove the Austrians across the Danube, recapturing Nish, Vidin, Semendria and Belgrade; repulses were also inflicted on the Venetians and the Russians. In the course of the campaign the sultan died, being succeeded by his brother Ahmed. The successes of the Turks were not maintained, the Austrians inflicting on them a crushing defeat at Slankamen, where Mustafa Kuprili was killed, and driving them from Hungary. After four years of disaster Ahmed died; he was succeeded by his nephew Mustafa. The tide of success now turned again in favour of the Turks, who recaptured Karansebes and Lippa, and at Lugos exterminated by the weight of overwhelming numbers an Austrian force under Field-marshal Count Friedrich von Veterani (1630–1695), the hero of many victories over the Turks, who was killed in the battle. Elsewhere, too, the Ottoman arms were victorious; in February the Venetians suffered a double defeat in the roadstead of Chios, and the island fell into the hands of the Turks. But Prince Eugene's genius restored the Austrian fortunes, and the Turks were utterly routed at Zenta on the Theiss, losing more than 15,000 men (1697). Russia, driven from Azov in 1695, succeeded in capturing it in the following year; Venice continued to press the Turks; in this condition of affairs Hussein Kuprili (*q.v.*) was called to office; England and Holland urged Turkey to

Mustafa II., 1695–1703.

make peace, and after long negotiations a series of treaties were concluded in January 1699 at Karlowitz, that with Poland being signed on the 16th and those with Austria and Venice on the 26th. The main provisions of these were, that Turkey retained the Banat, while Austria kept Transylvania; Poland restored the places captured in Moldavia, but retained Kamenets, Podolia and the Ukraine; Venice restored her conquests north of Corinth, but kept those in the Morea and Dalmatia. On the 4th, Russia concluded a two years' armistice, but remained in possession of Azov, which was formally ceded to her by the definitive treaty of peace signed at Constantinople on the 13th of June 1700. The peace of Karlowitz marks the definitive termination of Turkey's power of offence in Europe. Apart from the heavy losses which it imposed on her, it constitutes a fresh departure in her history, as putting an end to her splendid isolation and rendering her dependent on the changes of European politics. It is noteworthy also as being the first occasion on which representatives of the mediating powers took part in the peace negotiations. The grand vizier's efforts to take advantage of the peace to introduce order in the country were unavailing; he was driven from office, and disorders ensued which led to the sultan's abdication.

The troubles were not ended by the accession of Ahmed III., and many high dignitaries of state were sacrificed to the lawlessness and insubordination of the Janissaries. Meanwhile Turkey found herself again involved with Russia. After the defeat of Charles XII. of Sweden at Poltava, this monarch took refuge in Turkey, and was allowed to reside at Bender. The Russians pursued him into Turkish territory; which led to a Turkish declaration of war (1710). The Turks succeeded in surrounding Peter the Great near the Pruth, and his army was menaced with total destruction, when the Turkish commander, the grand vizier Baltaji Mahommed Pasha, was induced by the presents and entreaties of the empress Catherine to sign the preliminary treaty of the Pruth (July 21, 1711), granting terms of peace far more favourable than were justified by the situation of the Russians. These were: the cession to Turkey of Azov with all its guns and munitions, the razing of all the forts recently built on the frontier by Russia, the renunciation by the tsar of all claim to interfere with the Tatars under the dominion of the Crimea or Poland, or to maintain a representative at Constantinople, and Russia's consent to Charles's return to Sweden.[1] It was long, however, before the latter relieved Turkey of his presence. During the campaign Peter had entered into alliance with the hospodars of Moldavia and Walachia, respectively Demetrius Cantemir and Constantine Brancovano, from whom he had received material assistance. These were naturally dismissed after the defeat of the Russians; the former made good his escape to Russia, the latter was executed. The sultan determined henceforth to appoint Greeks to the principalities as more likely to be subservient to his will than the natives hitherto appointed. This system was continued until the Greek insurrection of 1821.

Ahmed III., 1703-1730.

Russia having thus lost all the advantage gained by the peace of Karlowitz, Venice was next taken in hand, she having invaded the Bosnian frontier and incited the Montenegrins to revolt, besides capturing Turkish ships in the Mediterranean. These acts were held to be infractions of the treaty, and war was declared (1715). The result was the stamping out of the insurrection in Montenegro and the capture of the whole of the Morea. The fleet also took Tinos and Cerigo, as well as the three forts still remaining to the Venetians in Crete. Turkey's action, and the preparations being made for the siege of Corfu, now brought about the intervention of Austria. Charles VI., weary of the war for the Spanish succession, had shortly before concluded the peace of Rastadt (1715) and was anxious that Venice should not be too hardly pressed. He therefore urged Turkey to give up to Venice certain places in Dalmatia as a compensation for the loss of the Morea. The Porte was at first disposed to comply, but the party of resistance finally prevailed. War was declared against Austria (1716); the fleet sailed for Corfu and the army crossed the Save from Belgrade to Semlin. Near Peterwardein a great battle was fought, in which the Austrians completely routed the Turks; pursuing their advantage they took Temesvâr and overran the Banat; in 1717 they captured Belgrade, the Turks retreating to Adrianople. England and Holland now urged their mediation, and after negotiations the treaty of Passarowitz (Pozharevats in Servia) was signed (July 21, 1718); Venice ceded the Morea to Turkey but kept the strongholds she had occupied in Albania and Dalmatia; Belgrade, Temesvâr and Walachia as far as the Olt were retained by Austria.

Meanwhile relations with Russia continued strained. The peace of 1712 had been concluded only for a term of years, and the neglect of the tsar to carry out its provisions had all but led to a fresh outbreak of hostilities when the intervention of the other powers led in 1713 to the renewal of the treaty; and in November 1720 it was superseded by a treaty of "perpetual peace," signed at Constantinople. But, though the questions at issue between Russia and Turkey in Poland and the northern littoral of the Black Sea were thus for the time settled, the aggressive designs of Russia in the Caucasus and in Persia soon caused a renewal of anxiety at Constantinople. Again war all but broke out; but, through the intervention of France, a treaty of partition was signed at Constantinople on the 23rd of June 1724, whereby the shores of the Caspian from the junction of the Kur and the Arras (Araxes) northwards should belong to Russia, while the western provinces of Persia should fall to the share of Turkey. These provinces had not yet been conquered by Turkey; and, when a part of them had been taken, a treaty was concluded with the Afghan Ashraf Shah, who had risen to supreme power in Persia, by which Turkey should retain them on condition of recognizing him as shah (Oct. 23, 1727). But Nadir Kuli Khan came forward as the champion of Shah Tahmasp II., the rightful ruler, and drove the Turks from these provinces, capturing Tabriz. This news caused consternation at Constantinople; the inevitable revolt of the Janissaries followed, headed this time by one Patrona Khalil, and the sultan was forced to abdicate in favour of his nephew Mahmud. With difficulty the rebellion was suppressed; in 1733 the war with Persia was resumed, and after three years of fighting Nadir succeeded in 1736 in inducing Turkey to recognize him as shah of Persia and to restore the territory captured since the reign of Murad IV.

Mahmud I., 1730-1754.

Russia's designs on Poland now brought about war. On the death of Augustus II., king of Poland (1733), France had put forward as candidate Stanislaus Leszczynski, Louis XV.'s father-in-law. Austria and Russia supported Augustus III., elector of Saxony, and the empress Anne marched an army into Poland and compelled the election of her candidate, though Russia had bound herself by the treaty of 1711 and again by that of 1720 to abstain from all interference with Poland. France thereupon declared war against Russia and her ally Austria, and her envoy, the marquis de Villeneuve, urged Turkey to join by representing the danger of allowing Russian influence to extend. Turkey had cause of complaint against Russia for refusing to allow the Crimean troops to march through Daghestan during the Persian campaign, and on the 28th of May 1736, war was declared, in spite of the efforts of England and Holland. The Russians had not waited for the formal declaration of war; and on the very day that this was notified by the hanging out of the horse-tails before the Seraglio at Constantinople a Russian army under Marshal Münnich stormed the ancient wall that guarded the isthmus of the Crimea. While Münnich conducted a systematic devastation of the peninsula, forces were detached under his lieutenants Leontiev and Lascy to attack Kinburn (Kiiburun) and Azov. Both these places fell; and in July of the following year Münnich captured Ochakov.

War of Polish Succession.

[1] The definitive treaty was signed at Constantinople on the 16th of April 1712 (renewed June 5, 1713).

Meanwhile the western sea-powers had made earnest efforts to restore peace, and in August 1737 the plenipotentiaries of the combatant powers met at Niemirov to arrange terms under their mediation. But Austria, which had made a great show of seconding their efforts, now began to unmask her real aims, which were to take advantage of Turkey's embarrassments to push her own claims in the principalities and the Balkan Peninsula. To the refusal of the sultan's representatives to concede any of her demands, Austria replied by revealing the existence of an alliance with Russia, which she threatened to make actively offensive if her terms were refused. In November the conferences broke up; in the spring of the following year Austrian divisions advanced simultaneously into Bosnia, Servia and Walachia; and in July the main army, under the prince of Lorraine, crossed the frontier and captured Nish. In spite of this initial success, however, the campaign proved disastrous to the Austrians; and France, which had meanwhile come to terms with the emperor, endeavoured to mediate a peace in conjunction with Sweden and Holland. But the Ottomans, though the negotiations continued throughout 1738, were in no hurry to come to terms; for the tide of war had turned against both Austrians and Russians; Ochakov and Kinburn were recaptured; and the victorious Turks crossed the Danube and penetrated far into the Banat. Not till the middle of 1739 would they consent to negotiate seriously for peace. The conferences were opened at the close of July in the camp of the grand vizier, who was pressing Belgrade hard and demanded the surrender of the city as a *sine qua non*. This was conceded; on the 1st of September, under the mediation of the French ambassador Villeneuve, the preliminaries were signed; on the 4th the grand vizier made his formal entrance into the city, where on the 18th the definitive treaties with Austria and Russia were signed. By the former Austria gave up Belgrade and the places on the right bank of the Save and the Danube which she had gained by the treaty of Passarowitz, together with the Austrian portions of Walachia. The treaty with Russia provided that Azov should be razed and its territory devastated to form a barrier, Russia having the right to erect a new fortress at Cherkask, an island in the Don, near Azov, and Turkey to build one on the border of Kuban near Azov. But Taganrog was not to be refortified, and Russia was to have no war-ships on the sea of Azov or the Black Sea. The Kabardias, great and little, were to remain independent, to serve as a barrier between the two empires. By the 12th article the Ottoman government agreed "amicably to discuss" the question of recognizing the tsar's claim to the imperial title, and by the 13th admitted his right to send to Constantinople representatives of whatever rank he might judge fitting (Noradounghian, *Recueil*, i. 258).

Scarcely two years after the signature of the treaty of Belgrade sinister rumours reached Constantinople from Persia, where Nadir Shah, on his return from India, was planning an attack on Mesopotamia. The war, which broke out in 1743, was waged with varying fortunes, and the peace by which it was concluded on the 5th of September 1746, beyond stipulating for a few privileges for Persian pilgrims to the holy places, altered nothing in the settlement arranged ten years before with Murad IV. In the war of the Austrian Succession, which followed the accession of Maria Theresa to the Habsburg throne, Turkey, in spite of the urgency of France, would take no share, and she maintained the same attitude in the disorders in Persia following the death of Nadir Shah.

Osman III., 1754-1757.

In 1754 the Sultan Mahmud died. He was succeeded by his brother Osman, whose three years' reign was marked by no political event of special importance. Osman III. was succeeded by his cousin Mustafa. At the outset of his reign negotiations were actively pursued for the conclusion of a treaty with Prussia, to counteract the alliance between France and Austria contracted in 1756; and these resulted in the signature of Capitulations, or a treaty of friendship and commerce (March 22, 1761). The attitude of the northern powers, however, and especially of Russia, towards Poland was beginning to excite the sultan's liveliest suspicions; and these the accession, in 1762, of the masterful Catherine II. to the Russian throne was not calculated to allay. In 1763, Catherine took advantage of the death of Augustus III. of Poland to force her favourite, Stanislaus Poniatowski, on to the vacant throne. From the committee of patriots at Warsaw complaints and warnings were carried to Constantinople; and the cession of Podolia was offered as the price of a Turkish attack on Russia. The sultan, though inclined to take up the cause of the Polish dissidents, was slow to move, and contented himself for a while with protests and threats. But the aggressive policy of Russia in the direction of the Caspian and Black Seas became more and more evident; complaints reached the Porte of a violation of the neutrality of Kabardia, of a seditious propaganda in Moldavia by Russian monks, and of Russian aid given to the malcontents in Servia and Montenegro. Added to all this was the news of the continual Russian military aggressions in Poland, against which the Catholic confederation of Bar continued to appeal for aid. At last, on the 6th of October 1768, on the refusal of the Russian minister to give guarantees for the withdrawal of the Russian troops from Poland and the abandonment of Russia's claim to interfere with the liberties of the republic, war was declared and the Russian representative was imprisoned in the Seven Towers.

Mustafa III., 1757-1773.

The war that followed marks an epoch in the decay of the Ottoman Empire and in the expansion of Russia. When, in the spring of 1769, the first serious campaign was opened by a simultaneous attack by three Russian armies on the principalities, the Crimea and the buffer state of Kabardia, the Turks, in spite of ample warning, were unprepared. They were hampered, moreover, by an insurrection in the Morea, where a Russian expedition under Orlov had stirred up the Mainotes, and by risings in Syria and Egypt. It was not, however, till September that the fall of Khotin in Bessarabia marked the first serious Russian success. The following year was more fatal. In May the Ottoman fleet was attacked and destroyed off Cheshme, and the Russian war-ships threatened to pass the Dardanelles. In June Romanzov's victory at Kartal made him master of the principalities, and by November the fortresses of Izmail and Kilia, guarding the passage of the Danube, and those of Akkerman and Bender on the Dniester had fallen into the hands of the Russians. The campaign of 1771, which opened with a gleam of success in the capture of Giurgevo, proved yet more disastrous to the Turks, the Russians passing the Danube and completing the conquest of the Crimea. Prussia and Austria now offered their mediation; and in June conferences were opened at Focshani, which led to no result. In the following year a conference, from which the Austrian and Prussian representatives were excluded, was opened at Bucharest (November 1772). In February 1773 the Russian plenipotentiary delivered his ultimatum, of which the most important demands were the cession of Kerch, Yenikale and Kinburn, the free navigation of the Black Sea and Archipelago for Russian trading and war vessels, and the recognition of the tsar's right to protect the Orthodox subjects of the sultan. These conditions were submitted to Constantinople, and rejected after a stormy debate in the divan. The conference of Bucharest now broke up, and the war continued. The successful defence of Varna and Silistria seemed to justify the stubbornness of the Porte.

Abd-ul-Hamid I., 1773-1789.

On the 24th of December 1773 Mustafa III. died, and was succeeded by his brother Abd-ul-Hamid I., a weakling, from whose character nothing could be expected to retrieve the now desperate fortunes of the war. The exhaustion of the treasury was evidenced by the absence of the usual donative to the troops; and the demoralization in both army and court made further resistance useless. At the beginning of July the Russians, under Kamenskiy, were before Shumla; and a few days later the grand vizier and his army, their communications with the capital severed, were surrounded in the fortress. Negotiations for peace were now opened and on the 21st of July—chosen by the Russian plenipotentiary as the anniversary of the humiliating convention of the Pruth—the treaty of Kuchuk Kainarji was signed. Its terms were the most onerous as yet imposed on the Ottoman sultans. The Tatars from the frontier of Poland to the shores of the Caspian, including those of the Crimea and Kuban, were declared independent under their own khan of the race of Jenghiz, saving only the religious rights of the sultan as caliph of Islam. Russia, however, retained the fortresses of Kerch, Yenikale and Kinburn, with the desert country between the Bug and the Dnieper, while Ochakov was left to the Turks. Bessarabia, with the fortresses of Akkerman, Izmail and Kilia, was restored to Turkey. Moldavia and Walachia were likewise restored, but under conditions which practically raised them to the position of semi-independent principalities under Russian protection (art. xvi.). Azov and its district were annexed to Russia, and the two Kabardias were transferred subject to the consent of the khan of the Crimea. Russia undertook to evacuate Mingrelia and Georgia. The recognition of the imperial title (*padishah*) was at last conceded to the Russian tsars.

Treaty of Kuchuk Kainarji, 1774.

Commerce and navigation in the Black Sea and the Mediterranean were free to both countries. Turkey was to pay a war indemnity of 15,000 purses, the Russian fleet was to withdraw and the islands captured by it to be restored. By article vii. of the treaty the Sublime Porte undertook "to protect the Christian religion and its churches" and conceded to the ministers of Russia the specific right to "make representations in favour of the new church" which, under article xiv. of the same treaty, the Russian government was empowered to build, in addition to the embassy chapel "in the street named Bey Oglu." This article is of great historical importance as forming the basis of the later claim of Russia to possess by treaty the right to protect the Orthodox subjects of the Porte.[1] Poland, the original cause of the war, was not even mentioned in the treaty, having been partitioned in 1772.

After yielding to these hard conditions, Turkey took advantage of her respite to strengthen the frontier defences and to put down the rebellions in Syria and Egypt; some effort was also expended on the hopeless task of reforming the Janissaries. It was not long before Russia showed that it was not the independence but the absorption of the Crimea which she desired. In 1779 a rupture on this account was only averted through the mediation of the French ambassador, coupled with the fact that Turkey was in no condition to enter upon hostilities, owing to the outbreak of plague in her army. The Porte, unable to resist, was obliged to consent to the convention of Ainali Kavak (March 10, 1779) whereby the Russian partisan, Shahin Girai, was recognized as khan of the Crimea, the admission of Russian vessels to navigate Turkish waters was reaffirmed and Russia's right of intervention in the affairs of the Danubian principalities was formally recognized. Five years later Potemkin induced the chiefs of the Crimea and Kuban to hold a meeting at which the annexation of their country to Russia was declared, Turkey giving her consent by a convention, signed at Constantinople, on the 8th of January 1784, by which the stipulations as to the liberty of the Tatars contained in the treaty of Kuchuk Kainarji and the convention of Ainali Kavak were abrogated. In 1786 Catherine made a triumphal progress through the Crimea in company with her ally, Joseph II., who had succeeded to the imperial throne on the death of his mother. These events and the friction caused by mutual complaints of infringements of the treaty stirred up public opinion in Turkey, and the British ambassador lent his support to the war party. In 1788 war was declared, but Turkey's preparations were inadequate and the moment was ill-chosen, now that Russia and Austria were in alliance, a fact of which Turkey became aware only when the horse-tails were planted for the campaign. The Turks drove back the Austrians from Mehadia and overran the Banat (1789); but in Moldavia Romanzov was successful and captured Jassy and Khotin. After a long siege Ochakov fell to Potemkin, and all its inhabitants were massacred. This news affected the sultan so deeply as to cause his death.

Selim, the late sultan's nephew, who succeeded, made strenuous preparations for continuing the war, but his generals were incompetent and his army mutinous; expeditions for the relief of Bender and Akkerman failed, Belgrade was taken by the Austrians, Izmail was captured by Suvorov, and the fall of Anapa completed the series of Turkey's disasters. Sultan Selim was anxious to restore his country's prestige by a victory before making peace, but the condition of his troops rendered this hope unavailing; while Prussia, though on the 31st of January 1790 she had signed an offensive treaty with Turkey,[2] gave her no help during the war. Accordingly a treaty was signed with Russia at Jassy (Jan. 9, 1792) by which the Crimea and Ochakov were left to Russia, the Dniester was made the frontier in Europe, and the Asiatic frontier remained unchanged. Joseph II. had died, and his successor, Leopold II., was averse from the Russian alliance. Through the mediation of England, Holland and Prussia, Turkey and Austria concluded on the 4th of August 1791 the treaty of Sistova, by which Belgrade and the other conquests made by Austria were restored.

Selim III., 1789–1807.

The conclusion of peace was welcomed by Selim as the opportunity for carrying out reforms, of which he thoroughly realized the necessity in every branch of the administration, and especially in the army, to whose defects the disasters of the state were due. Accordingly it was decided to form troops known as *nizam-i-jedid*, affiliated to the Janissaries so as to disarm the jealousy of the latter, properly drilled and wearing a distinctive uniform. The fleet was reorganized, military schools were established, and skilled instructors were obtained from Europe. These reforms excited much opposition, which was at first unheeded. Meanwhile Turkey came into conflict with France. Throughout all the vicissitudes of the Revolution the relations between the two states had remained unimpaired, and Turkey had been one of the first countries to recognize the republic. Bonaparte's sudden occupation of Egypt (1798) came therefore as a complete surprise. This expedition was in reality directed against English rule in India. Nelson's destruction of the French fleet at the battle of the Nile disconcerted Bonaparte's plans; he hoped to pursue his designs through Syria, and laid siege to Acre, which, however, successfully held out. Turkey now joined Great Britain and Russia against France.[3] The Russian and Turkish fleets attacked and took the Ionian Islands, which had become French by the treaty of Campo Formio, and certain towns, hitherto unconquered, on the Albanian coast. An expeditionary force was also sent against Bonaparte, now practically blockaded in Egypt. This was routed and driven into the sea at Abukir (July 15, 1799). For the subsequent operations in Egypt, which ended in its evacuation by the French after the British victory at Alexandria, see EGYPT: *History*.

The War with France.

Meanwhile in Turkey disorder prevailed in almost every province of the empire, and the local governors in many places became entirely independent, oppressing the people under their rule and often driving them to revolt. This was notably the case in Servia, where the temporary domination of Austria, to which the treaty of Sistova (1791) put an end, had had the effect of awakening the national spirit of the people. But no armed manifestation of revolt had taken place until the lawless and savage conduct of the Janissaries, who had made themselves masters of the country, assisted by the notorious governor of Vidin, Pasvan Oglu,

Servian Rising.

[1] See G. F. de Martens, *Recueil des traités*, 1st series, vol. ii. p. 286, also Noradounghian, *Recueil*, p. 319.

[2] Text in Martens, *Recueil*, 2nd series, vol. iv. p. 466.

[3] The treaty of alliance with Russia was signed on the 23rd of December 1798, that with Great Britain on the 5th of January 1799.

and his band of outlaws, drove the peaceful rayas to rebel. The insurgents chose as their captain one George Petrovich, nicknamed Kara Georgi (*i.e.* Black George), and under his able leadership succeeded in capturing Belgrade and in breaking the power of the Janissaries. The Porte also sent an army against Pasvan Oglu, but after reducing him to submission reinstated him in his government. A serious outbreak took place at Adrianople in 1804, where 20,000 of the new troops had been sent, ostensibly to put down the revolt in Servia, but really to try to bring about the reform of the European provinces. So strong was the opposition that the troops were recalled, and the anti-reform party was greatly strengthened. The Wahhābi movement in Nejd now began to assume serious proportions. These religious sectaries attacked and plundered all Mussulmans not conforming to their peculiar tenets; they overran Kerbela and the Hejaz, sacking the holy cities and closing the pilgrim routes. Only in the reign of Mahmud II. were they put down (see WAHHABIS).

Complications with Russia.

In 1802, by a treaty of peace signed at Paris on the 25th of June, France resumed her former terms of friendship with Turkey. Russia, desirous of deriving some return for the support which she had given the sultan during his rupture with the French, induced the Porte to address to her a note in which the right of intervention in the affairs of the principalities, conferred on her by the treaty of Kainarji and reaffirmed in the convention of Ainali Kavak, was converted into a specific stipulation that the hospodars should be appointed in future for seven years and should not be dismissed without the concurrence of the Russian ambassador at Constantinople. In pursuance of this agreement Constantine Ypsilanti was appointed to Walachia and Alexander Muruzi to Moldavia—both devoted to Russian interests. Their intrigues in favour of the Greek and other revolutionary movements induced the Porte to dismiss them in 1806, contrary to the arrangement of 1802. Russia and England hereupon used threatening language, and Turkey replaced the hospodars. But war was nevertheless declared on the 27th of December 1806, and Russia occupied the principalities. The British ambassador sought by every means in his power to induce Turkey to give way to Russia, going so far as to guarantee the withdrawal of the Russian troops from Moldo-Walachia if the Porte remained at peace, and threatening that if Turkey persisted in her opposition England would join with Russia against her. But France's influence, backed by the strong personality of her ambassador, General Sebastiani, was sufficient to enable the sultan to withstand these arguments, and the British ambassador broke off relations and withdrew to the fleet at Tenedos (February 1807). Helped by a strong south wind, the British war-ships passed up the straits and anchored off the Seven Towers. An ultimatum was presented ordering Turkey within twenty-four hours to dismiss the French ambassador, hand over the Turkish fleet, and make peace with Russia. With Sebastiani's encouragement the Porte resisted these demands; in one day a thousand guns were ranged along both sides of the Bosporus; and after a stay of ten days the British fleet was ordered to leave, and was considerably damaged by the fire of the forts while passing down.

Revolt against Selim.

Meanwhile the sultan's whole efforts were directed towards the reform of the country; the newly-instituted militia was in every respect a success; it grew in numbers, and hopes were entertained that it would gain popularity. But the Janissaries and the corrupt officials were fundamentally opposed to the scheme, and the conservatives joined with them against such reforms of European origin. The rulers of the provinces shared these views; the consequence was disquiet and confusion throughout the empire. At this difficult moment the army was obliged to march to the Danube, leaving the government in the hands of men hostile to reform. In 1807 the garrisons of the Black Sea forts at the entrance of the straits rose in rebellion, headed by one Kabakji Mustafa, and killed their officers. The sultan sought to appease them by pacific means, but the movement spread to the Janissaries, who insisted upon the abolition of the new troops. But even this concession did not satisfy them; they dethroned Selim and proclaimed his nephew Mustafa.

Mustafa IV., 1807–1808.

The new sultan was obliged to abolish all the reforms, and during practically the whole of his fourteen months' reign the Janissaries were in rebellion, even while facing the Russians. All officers who were partisans of the reforms were obliged to take refuge in flight; and Turkey's position would have been desperate but for the conclusion of the peace of Tilsit (July 7, 1807) between Russia and France, to which Turkey also became a party. The army hereupon retired to Adrianople, and the powerful pasha of Rustchuk, Mustafa Baïrakdar, who had distinguished himself by his resistance to the Russians, and who thoroughly shared Selim's desire for reform, was now induced by the many officers who held similar views to march on Constantinople to restore Selim to the throne. But he arrived too late; Selim had already been killed; the unworthy Mustafa was put to death, and Mahmud, the sole survivor of the house of Osman, became sultan.

Mahmud II., 1808–1839.

Mustafa Baïrakdar, who was now raised to the dignity of grand vizier, succeeded in inspiring the Janissaries with a wholesome respect, due to their dread of the 10,000 irregulars known as *kirjalis* by whom he was accompanied. The remnants of the abolished new troops were collected and formed into regiments affiliated to the Janissaries under the name of *seymen-i-jedid*; the dignitaries of state were called upon to take an oath of fidelity and loyalty. The feast of Ramazan hereupon occurring, the grand vizier unwisely allowed his own troops to disperse. Taking advantage of this opportunity, the Janissaries rose by night and besieged the house of the grand vizier, who eventually blew himself up in the arsenal. Fighting became general and extended to the fleet, which bombarded the capital. The Janissaries slaughtered all the "new troops" whom they met, and finally extorted an amnesty from the terrified government.

Treaty of Bucharest; Troubles in Servia.

After the peace of Tilsit an armistice had been agreed upon with Russia (Aug. 24, 1807). Turkey was at this time the only neutral state in Europe; it was of vital importance that she should not be absorbed into the Napoleonic system, as in that case Russia would have been exposed to a simultaneous attack from France, Austria, Turkey and Persia. Accordingly, though France made every attempt to induce Turkey to adopt her side, the young Stratford Canning succeeded in causing the resumption of the peace negotiations at Bucharest, broken off through Russia's terms being considered too onerous, and followed by the capture of Izmail and Bender. The British diplomatist secured his first triumph in the signature of the treaty of Bucharest (May 28, 1812) whereby Khotin, Bender, Kilia and Akkerman were left to Russia; the frontier was fixed at the Pruth; the Asiatic boundary was slightly modified. The treaties as to the principalities were renewed; and though Servia was restored to the direct rule of Turkey it was stipulated that clemency was to be observed in the Porte's dealings with the country, which was given the power of regulating its own affairs.

The vagueness of these latter provisions at once gave rise to disputes, and in 1813 the Turkish troops occupied the country. The new pasha of Belgrade appointed one Milosh Obrenovich headman of his own district, but a few years later Milosh raised a successful revolt, drove out the Turks, and re-established Servian semi-independence. Karageorge, who had fled to Austria in 1812, was induced to return, but Milosh caused him to be murdered, and in 1817 was by a popular vote named hereditary prince of Servia.

The affairs of Servia, however, were not the only question left unsettled by the treaty of Bucharest. In the course of the war with Persia Russia had received permission from the Ottoman government to use, for a limited time, the easy road from the Black Sea to Tiflis by way of the valley of the Rion (Phasis) for the transport of troops and supplies, and this permission had been several times renewed. Wishing to make this important privilege permanent, Russia by secret articles of the Treaty of Bucharest had secured the cession of this district, in return for an undertaking to destroy the forts of Kilia and Izmail on the Danube. But the sultan refused to ratify these articles, and the relations between Russia and Turkey were therefore determined by the patent treaty only, which positively stipulated for the evacuation by the Russians of every spot occupied by them on Turkish soil in Asia. When the Russians showed no signs of withdrawing from the valley of the Rion, the sultan threatened to renew the war, the sole result of which was to reveal the determination of the tsar not to be bullied into concessions. The dispute, at first of little importance, developed in seriousness during the next year or two, owing to the avowed intention of Russia, which by conquest or treaties with independent chiefs had acquired all the high land between the Caspian and the Black Sea, to take possession of the low lands along the coast, between Anapa and Poti, of which the sultan claimed the sovereignty.

Congress of Vienna.

Such was the situation when the question of a European guarantee of Turkey was raised at the Congress of Vienna. In view of the multiple dangers to which the Ottoman Empire was exposed, both from without and from within, and of the serious consequences to the world's peace which would result from its break-up, there was a strong feeling among the powers in favour of such a guarantee, and even the emperor Alexander was willing to agree to it in principle. But nothing could be done until the Porte should have come to terms with Russia as to the Treaty of Bucharest; for, as the British ambassador, Sir Robert Liston, was instructed to point out to the Ottoman government, "it is impossible to guarantee the possession of a territory of which the limits are not determined." With the consent of the tsar, it was proposed to submit the questions at issue to the decision of Great Britain, France and Austria; and the Porte was informed that, in the event of its accepting this arrangement, the powers would at once proceed to guarantee the integrity of the Ottoman Empire. But the sultan could not bend his pride to suffer foreign intervention in a matter that touched his honour, and the return of Napoleon from Elba threw the Eastern Question into the background. The Ottoman Empire thus remained outside the European concert; Russia maintained her claim to a special right of isolated intervention in its affairs; and the renewal of war between Russia and Turkey was only postponed by the preoccupation of Alexander with his dream of the "Confederation of Europe."

Egypt.

Meanwhile, within the Ottoman Empire there was every sign of a rapidly approaching disintegration. In Egypt Mehemet Ali had succeeded in establishing himself as quasi-independent ruler of the country. By his action during Napoleon Bonaparte's invasion, and later when the British fleet after leaving Constantinople in 1807 proceeded to Egypt, he had to some extent acquired the goodwill of the Turkish government. In 1811 he was called upon by the Porte to put down the Wahhābi insurgents (see ARABIA, vol. ii. p. 268), his success in this matter, and especially in the recovery of the holy cities, adding greatly to his prestige.

Greek Revolt.

Sultan Mahmud now devoted himself to breaking the overgrown power of the local governors, which had for many years practically annihilated that of the central authority. Their extortions impoverished the whole country, yet the abolition of the system might perhaps have been carried out more gradually and with greater precaution, and Turkey more than once felt the want of their aid, questionable as its value often was. Thus Ali (*q.v.*), Pasha of Iannina, the most famous of these, though insubordinate and inclined to intrigue with foreign powers in the hope of making himself independent, had used his influence to keep the Greeks quiet; and it was only after his power had been broken in 1821 that the agitation of the *Hetairia* issued in widespread dangerous revolt. The first hope of emancipation from the Turkish yoke had been founded by the Greeks on Peter the Great, who had planned the expulsion of the Turks from Europe and had caused the inscription "Petrus I., Russo-Graecorum Monarcha" to be placed beneath his portrait engraved at Amsterdam. Catherine II. following in his footsteps, aspired to found a Greek empire, the throne of which was to be occupied by her nephew, Constantine, specially so baptized, and brought up by Greek nurses (see CONSTANTINE PAVLOVICH). During the war of 1770 the Greeks had risen in an abortive rebellion, promptly crushed by the Turks. But the idea of liberation continued to grow, and about 1780 the Society of Friends (Ἑταιρία τῶν φιλικῶν) was founded at Bucharest by the fervent patriot and poet, Constantinos Rhigas (*q.v.*). The secret organization, temporarily checked by Rhigas's arrest and execution in 1798, was revived at Odessa in 1814; it extended throughout Turkey, and in 1820 the insurrection took shape, a favourable opportunity being afforded by the outbreak of hostilities between Ali Pasha and the Porte. (See GREEK INDEPENDENCE, WAR OF.)

On the 6th of March 1821 Prince Alexander Ypsilanti, son of the hospodar Constantine, and a general in the Russian service, crossed the Pruth, proclaiming the revolt of the Greeks against the sultan and the intention to restore the Greek Empire of the East. But in the principalities, where the Vlach peasants regarded the Phanariots as worse oppressors than the Turks, the movement had little chance of success; it was doomed from the moment that the emperor Alexander disavowed Ypsilanti's claim to his support (see ALEXANDER I.). After some initial successes the Greeks were finally routed at the battle of Dragashani (June 19, 1821). It was far otherwise with the insurrection which broke out at the beginning of April in the Morea. The Mussulman population of the Morea, taken unawares, was practically exterminated during the fury of the first few days; and, most fatal of all, the defection of the Greeks of the islands crippled the Ottoman navy by depriving it of its only effective sailors. The barbarous reprisals into which Sultan Mahmud allowed himself to be carried away only accentuated the difficulty of the situation. The execution of the patriarch Gregorios, as technically responsible for the revolt, was an outrage to all Christendom; and it led at once to a breach of diplomatic relations with Russia.

To prevent this breach developing into war was now the chief study of the chanceries. Public opinion throughout Europe was violently excited in favour of the Greeks; and this Philhellenic sentiment was shared even by some of the statesmen who most strenuously deprecated any interference in their favour. For at the outset Metternich was not alone in maintaining that the war should be allowed to burn itself out "beyond the pale of civilization." The mutual slaughter of barbarians in the Levant seemed, even to George Canning, a lesser evil than a renewed Armageddon in Europe; and all the resources of diplomacy were set in motion to heal the rupture between Turkey and Russia. In spite of the emperor Alexander's engagements to the Grand Alliance and the ideal of European peace, this was no easy matter; for the murder of the patriarch was but the culmination of a whole series of grievances accumulated since the Treaty of Bucharest. Moreover, the Porte was thrown into a suspicious mood by the contrast between the friendly language of the western powers and the active sympathy of the western peoples for the Greeks, who were supported by volunteers and money drawn from all Europe. But, though the sultan remained stubborn, the emperor Alexander, who since the Congress of Laibach had been wholly under Metternich's influence, resisted the clamour of his people for war, and dismissed his Greek minister Capo d'Istria (*q.v.*). The Congress of Verona (1822) passed without any serious developments in the Eastern Question.

The stubborn persistence of the Greeks, however, dashed Metternich's hope that the question would soon settle itself, and produced a state of affairs in the Levant which necessitated some action. In the instructions drawn up, shortly before his death, for his guidance at Verona, Castlereagh had stated the possibility of the necessity for recognizing the Greeks as belligerents if the war continued. The atrophy of the Ottoman sea-power had left the archipelago at the mercy of the Greek war-brigs; piracy flourished; and it became essential in the interests of the commerce of all nations to make some power responsible for the policing of the narrow seas. On the 25th of March 1823 accordingly, Canning announced the recognition by Great Britain of the belligerent character of the Greeks.

This roused the emperor Alexander to action, since it seemed as though Great Britain was aiming at ousting Russian influence in the Levant. He suggested a joint intervention of the powers; but the conference, which met at St Petersburg in April 1824, came to nothing, since Turkey and the Greeks alike refused to be bound by its decisions, and Canning would not hear of coercion being applied to either. The sole outcome of the conference was the offer in March 1825 of the joint mediation of Austria and Russia, which the Porte rejected.

Meanwhile Mahmud, realizing the impossibility of crushing the Greek revolt unaided, had bent his pride to ask the help of Mehemet Ali, who was to receive as his reward Crete, the Morea and the pashaliks of Syria and Damascus. The Egyptian fleet and disciplined army were now thrown into the scale; and from the moment when Ibrahim Pasha landed at Modon (Feb. 24, 1825), the fate of the Greeks seemed sealed. The Morea was quickly overrun; in April 1826 Missolonghi fell, after a heroic defence; in June 1827 Athens was once more in the hands of the Turks. Crowds of Greek captives were being sent as slaves to Cairo; and, should the powers not intervene, there was every prospect of Greece being depopulated and colonized with Mussulman negroes and fellahin.

At the close of 1825 an isolated intervention of Russia had seemed probable. A great army was assembled in the south of Russia, and the emperor Alexander had gone to place himself at its head when he died (Dec. 22, 1825). It was to prevent such an intervention that Canning seized the opportunity of the accession of Nicholas I. to send the duke of Wellington to St Petersburg in order to concert joint measures. The result was the protocol of St Petersburg of the 4th of April 1826, by which Great Britain was empowered to offer to the Ottoman government a settlement of the Greek question based on the establishment of Greece as a vassal and tributary state. Should the Porte refuse, the two powers were to take the earliest opportunity, either separately or in common, of establishing a reconciliation on the basis of the protocol.

Convention of Akkerman.

Russia, meanwhile, had seized the occasion to send to Constantinople an ultimatum demanding satisfaction for her own particular grievances; the Porte resented the intrusion of new demands before the others had been dealt with, and hurried on preparations for war. The reform of the army, however, involved the destruction of the Janissaries (*q.v.*), and though their massacre on the 15th of June left the sultan free to carry out his views with regard to the army, it left him too weak to resist the Russian demands. On the 7th of October, accordingly, these were conceded by the Convention of Akkerman. Its terms were: the confirmation of the Treaty of Bucharest and the opening of the navigation of the Black Sea to the Russian flag; a stipulation that the hospodars of Walachia and Moldavia should be elected by the boyars for seven years, their election being confirmed by the Porte which, however, had no power to dismiss them without the concurrence of the Russian ambassador at Constantinople; finally, Servia's autonomy was recognized, and, save in the fortresses, no Mussulman might reside there.

Agreement of the Powers as to Greece.

The Greek question was however, not yet settled. Months passed without any action being taken under the protocol of the 4th of April; and Russia suspected Great Britain of merely using the protocol to prevent her own isolated intervention. The situation was however materially altered by the end of August 1826; for the Greeks, driven to desperation, had formally invited the mediation of England, thereby removing Canning's objection to an unasked intervention. He now invited the co-operation of Russia in representations to the Porte on the basis of the protocol, and, in the event of its refusal to come to terms, suggested certain measures of coercion. The tsar consented, and proposed that the coercion should take the form of a pacific blockade of the Morea, so as to force Ibrahim, by cutting off his supplies, to evacuate the country. To this Great Britain agreed in principle; for Canning clearly saw the need for yielding on the question of a joint intervention, if the isolated intervention of Russia were to be prevented. In the conference of the five powers of the Grand Alliance opened at London in the early summer of 1827, however, a divergence of views at once became apparent. Austria and Prussia protested against any coercion of the Porte " to serve revolutionary ends " and, failing to carry their views, withdrew from the conference. France thereupon proposed to convert the protocol of the 4th of April into a treaty; Russia and Great Britain agreed; and on the 6th of July the Treaty of London was signed by the three powers.

By the patent articles of the treaty the powers agreed to secure the autonomy of Greece under the suzerainty of the sultan, but without any breach of friendly relations with Turkey. By additional secret articles it was agreed that, in the event of the Porte not accepting the offered mediation, consuls should be established in Greece, and an armistice proposed to both belligerents and enforced by all the means that should " suggest themselves to the prudence " of the high contracting powers. In general it was allowed that these means should be the " pacific blockade " proposed by the tsar. Instructions to this effect were sent to the admirals commanding in the Levant.

Navarino.

The armistice, accepted by the Greeks, was refused by Ibrahim, pending instructions from Constantinople, though he consented to keep his ships in the harbour of Navarino. The Greeks, having put themselves in the right with the powers, were free to continue the war; and the destruction of a Turkish flotilla off Salona on the 23rd of September followed. Ibrahim, taking this as a breach of the convention, set sail from Navarino northwards, but was turned back by Sir Edward Codrington, the British admiral. Then, the Russian and French squadrons having joined, it was determined to put further pressure on the Egyptian commander, and the allied fleets, on the morning of the 20th of October, stood into the bay of Navarino. A chance scuffle led to a battle, and by the evening the Turkish and Egyptian fleets had ceased to exist (see NAVARINO, BATTLE OF).

The effect on the passionate sultan of this " unparalleled outrage on a friendly power in time of peace " is easy to imagine. In spite of the weak efforts of the British government to palliate the significance of this " untoward incident," Turkey broke off diplomatic relations with the three powers concerned, and on the 20th of December Mahmud, giving full vent to his rage, issued a *hatt-i-sherīf* denouncing the cruelty and perfidy of the Christian powers, declaring the convention of Akkerman null and void, and summoning the faithful to a holy war. The struggle that followed was, however, destined once more to be a duel between Russia and Turkey. Great Britain, when Canning was no longer at the helm of state, had reverted to the traditional policy of preserving Ottoman integrity at all costs; the invitation of the tsar to accept the logical consequences of Navarino was refused; and Russia was left to settle her account with Turkey.

War with Russia.

The war that followed proved once more the wonderful resisting power of the Turks. In spite of the confusion due to the destruction of the Janissaries and army reforms as yet hardly begun, it cost the tsar two hardly fought campaigns before the audacious strategy of General Diebitsch enabled him to dictate the terms of the treaty of Adrianople (Sep. 14, 1829). Meanwhile the other powers had taken advantage of the reverses of the Russian arms to discount the effect of their ultimate victory by attempting to settle the Greek question. In July 1828 France had been commissioned to oust Ibrahim from the Morea; and though by a convention, concluded on the 9th of

August by Codrington with Mehemet Ali, the principle of evacuation by the Egyptian troops had already been settled before the arrival of the French expedition, the Morea remained for the time in French occupation. On the 16th of November a protocol of the London conference placed the Morea, with the neighbouring islands and the Cyclades, under the guarantee of the powers; and on the 22nd of March 1829 another protocol extended the frontier thus guaranteed to the line Arta-Volo and included the island of Euboea. According to this instrument Greece was to be erected into a tributary state, but autonomous, and governed by an hereditary prince chosen by the powers.

Greek Independence.

The Treaty of Adrianople, by which the Danubian principalities were erected into practically independent states, the treaty rights of Russia in the navigation of the Bosporus and Dardanelles confirmed, and the districts of Anapa and Poti in Asia ceded to the tsar, included also a settlement of the Greek question on the terms of the protocol of the 22nd of March. This fact, which threatened to give to Russia the whole prestige of the emancipation of Greece, spurred the other powers to further concessions. The acceptance of the principle of complete independence, once more warmly advocated by Metternich, seemed now essential if Greece was not to become, like the principalities, a mere dependency of Russia. On the 3rd of February 1830 was signed a protocol embodying the principle of an independent Greece under Leopold of Coburg as "sovereign prince." This was ultimately expanded, after the fall of the Wellington ministry, into the Treaty of London of the 7th of May 1832, by which Greece was made an independent kingdom under the Bavarian prince Otto. (See GREECE: *History*.)

Syria.

Before the final settlement of the Greek question a fresh crisis had arisen in the affairs of Turkey. Her lessened prestige had already received a severe blow from the bombardment and capture of Algiers by the French in 1830, and her position was further embarrassed by revolts in Bosnia and Albania, when news reached Constantinople that Mehemet Ali had invaded Syria (Nov. 1, 1831), nominally in order to punish his enemy Abdullah, pasha of Acre, really in order to take by force of arms the pashaliks of Syria and Damascus promised as a reward for his services in Greece. An account of the collapse of the Turkish power before Mehemet Ali, and of the complicated diplomatic developments that followed, is given in the article MEHEMET ALI. Here it must suffice to say that the recognition of Mehemet Ali's claims, forced on the sultan by France and Great Britain, was followed in 1833 by the signature of the Treaty of Unkiar Skelessi, which seemed to place Turkey wholly in the power of Russia, after which Sultan Mahmud concentrated his energies on creating a force strong enough to crush his rebellious vassal.

At last, in 1839, his eagerness would no longer be restrained, and without consulting his ministers, and in spite of the warnings of all the powers, he determined to renew the war. On the 21st of April the Ottoman army, which had been massed under Hafiz Pasha at Bir on the Euphrates, crossed the stream, by the sultan's orders, and advanced on Damascus. On the 23rd of June it was attacked by Ibrahim at Nezib and annihilated. As for Mahmud, the news of the disaster reached Constantinople when he was unconscious and dying. Early on the 1st of July he was dead, and his son Abd-ul-Mejid, a lad of eighteen, reigned in his stead (see MAHMUD II.).

Abd-ul-Mejid, 1839–1861.

The Eastern Question had now suddenly once more entered an acute phase. The news of Nezib was immediately followed by that of the treason of Ahmed Pasha, the Ottoman admiral, who, on the plea that the sultan's counsellors were sold to Russia, had sailed to Alexandria and handed over the fleet to Mehemet Ali. With an inexperienced boy on the throne, divided and untrustworthy counsels in the divan, and the defences of the empire shattered, the house of Osman seemed doomed and the Turkish Empire about to dissolve into its elements. If Russia was to be prevented from using the Treaty of Unkiar Skelessi for her own purposes, it was essential that the powers should concert measures to deal with the situation. The story of the diplomatic negotiations that followed is told elsewhere (see MEHEMET ALI). Here it may suffice to say that the desire of the emperor Nicholas to break the entente between Great Britain and France led him to waive his special claims under the Treaty of Unkiar Skelessi, and that in the ultimate concert by which the question was settled France, which throughout supported Mehemet Ali, had no part. The intervention of the powers, based on the convention of London of the 15th of July 1840, led to the withdrawal of Ibrahim from Syria, and the establishment by the *firman* of the 13th of February 1841 of Mehemet Ali as hereditary pasha of Egypt under conditions intended to safeguard the sovereign rights of the Ottoman sultan. On the 10th of July the four signatory powers of the convention of London signed a protocol recording the closure of the incident (*protocole de clôture*), and on the 13th France united with them in signing another protocol (*protocole des détroits*) by which the powers engaged to respect the principle proclaimed by the sultan as to the closing of the Dardanelles to foreign warships.

Reform Policy in Turkey. The Tanzimāt.

The severe crisis through which the Ottoman Empire had passed accentuated the need for strengthening it by a drastic reform of its system. For such an experiment, though hampered by continual insurrections within and troubles without, Mahmud had done something to pave the way. The destruction of the Janissaries and the suppression of the quasi-independent power of the *dérébeys* had removed the worst disturbing elements; the government had been centralized; a series of enactments had endeavoured to secure economy in the administration, to curb the abuses of official power, and ensure the impartiality of justice; and the sultan had even expressed his personal belief in the principle of the equality of all, Mussulman and non-Mussulman, before the law. It was therefore no sudden revolution when, on the 15th of November 1839 Abd-ul-Mejid signalized his accession by promulgating the Tanzimāt, or Hatt-i-Sherīf of Gulhané, a decree abolishing the arbitrary and unlimited power hitherto exercised by the state and its officials, laying down the doctrine of the perfect equality of all Ottoman subjects of whatever race or creed, and providing for the regular, orderly and legal government of the country and the security of life, property and honour for all its inhabitants. Yet the feelings of dismay and even ridicule with which this proclamation was received by the Mussulmans in many parts of the country show how great a change it instituted, and how strong was the opposition which it encountered among the ruling race. The non-Mussulman subjects of the sultan had indeed early been reduced to such a condition of servitude that the idea of their being placed on a footing of equality with their Mussulman rulers seemed unthinkable. Preserved merely as taxpayers necessary to supply the funds for the maintenance of the dominant and military class, according to a foreign observer in 1571, they had been so degraded and oppressed that they dared not look a Turk in the face. Their only value was from a fiscal point of view, and in times of fanaticism or when anti-foreign sentiment ran high even this was held of little account, so that more than once they very nearly became the victims of a general and state-ordered massacre. Thus Sultan Ibrahim was dissuaded from such a step in 1644 only by the refusal of the Sheikh-ul-Islam to sanction the proceeding. The humane and tolerant measures provided for in the "nizam-i-jedīd," or new regulations for the better treatment of the Christians enacted by Mustafa Kuprili during his grand vizierate (1689–1691), did for a time improve the position of the rayas. But the wars with Russia and other Christian powers, and the different risings of the Greeks and Servians, helped to stimulate the feelings of animosity and contempt entertained towards them by the ruling race; and the promulgation of the Tanzimāt undoubtedly heralded for the subject nationalities the dawn of a new era.

The reforms introduced by Sultan Mahmud and by the Tanzimāt necessitated the remodelling of nearly all the departments of state. Towards the end of Mahmud II.'s reign ministries had been instituted, and a council of ministers had been established, presided over by the grand vizier. In 1837 the "council of the Sublime Porte" and the "supreme council of legal affairs" were established: the latter was the tribunal to which were referred all complaints against officials or claims pending between the state and private individuals; the council of the Sublime Porte was in 1839 transferred to the ministry of commerce; the supreme council of legal affairs after undergoing various modifications was in 1868 absorbed in the council of state. In 1837 a "council of public works" was instituted, converted ten years later into a separate ministry. In 1835 the "ministry of administration" was formed; two years later its title was changed to ministry of the interior. Regulations prescribing the duties of the local governors and officials of all ranks were drawn up only in 1865 and 1870, but since Mahmud's time their functions were exclusively civil and administrative. A regular hierarchical order was elaborated for the official classes, both civil and military, whereby the rank of each person was clearly defined.

Remodelling of the Administration.

The military reorganization dates from the destruction of the Janissaries (June 15, 1826). On that day Aga Hussein Pasha was appointed "Seraskier (commandant) of the victorious Mahommedan troops"; at first only two divisions were established, quartered respectively at Constantinople and Scutari. In 1833 the reserves were instituted, and three years later reserve commandants were appointed in six principal provinces. In 1843 the *corps d'armée* of Constantinople, Rumelia, Anatolia and Arabia were formed, and a military council was appointed. In 1847 a recruiting law was promulgated, reducing the period of service (until then unlimited in point of time), to five years. Military schools were founded. For the reorganization carried out from 1908 to 1910 see section *Army*, above.

After the Greek revolution the system of manning the navy from the Christian natives of the archipelago and the Mediterranean littoral was abandoned, and recruits for the navy are now selected under the ordinary law. A naval school and a modern factory and arsenal were established. The direction of the police, formerly left to the Janissaries, was formed into a ministry, and a body of gendarmerie was instituted. For the financial reforms see the section *Finance*, above.

Education.

The ministry of public instruction was established in 1857; until the reign of Selim III. (when a few military schools were established) the only schools had been the colleges of the Ulema and such preparatory schools as had been founded by private munificence. In 1838 the council of education had been created and several secondary state schools were founded. In 1860 the regulations for public education were promulgated; schools were everywhere opened, and in 1882 a portion of the receipts from certain *vakufs* were appropriated to their maintenance. As all the preparatory schools founded by the state were for Mussulman children only (the various Christian communities maintaining their own schools), *idadi* or secondary schools were established in 1884 for the instruction of children of all confessions. In 1868 the Imperial Lycée of Galata Serai was founded; most of the later generation of officials received their education there. Special state schools of medicine, arts, science, crafts, &c., have been created successively, and in 1901 a university was founded. Educational affairs in the provinces are now superintended by special officials.

Justice.

After the promulgation of the reforms, the judicial duties of the Imperial Divan, which with other functions also exercised those of a kind of supreme court of appeal, were transferred to the Sheikh-ul-Islam. The codification of the civil law, which soon became necessary, was effected by the promulgation in 1859 of the *Mejellé*, or civil code. Commercial and criminal codes, as well as codes of procedure, were drawn up, largely on the basis of the Code Napoléon. The rules regulating the Ulema were amended, a school for judges was founded, and the Sheikh-ul-Islam was charged with the duty of revising all judgments. In 1865 the court of cassation was founded.

Foreign Relations.

In 1835 the Reis-ul-Kuttab, to whom the superintendence of foreign affairs was entrusted, received the designation of minister for foreign affairs. Turkey had originally maintained no representatives abroad, and appointed such only for special occasions as *e.g.* the signature of a treaty or the announcement of a new sultan's accession. Selim III. was the first sultan who entered into regular relations with foreign powers, and employed permanent ambassadors; the practice was discontinued at the time of the Greek revolution and the consequent rupture with the powers. Later, during the Egyptian negotiations, ambassadors were accredited to London, Paris and Vienna. Sultan Abd-ul-Aziz's journey to Europe and the return visits paid by foreign princes strengthened Turkey's relations with foreign states.

The ministry of the *Evkaf* or pious foundations was established in 1827 and extended ten years later. Such foundations had been created from the earliest times, and the execution of the testator's wishes was generally left to his descendants, under the supervision of some high official designated in the act of endowment. In case of failure in the line of succession an administrator was appointed by the state. But many such foundations fell into disorder, and the ministry was created to exercise the requisite supervision.

Results of Reforms.

Though the provisions of the Tanzimāt were not fully observed, they afforded convincing proof that reform was entirely practicable in Turkey. Reforms were effected in every direction; the finances and the army were reorganized, military instructors being procured from Europe; the administration was gradually centralized, and good relations were cultivated with the powers, the only serious international controversy arising in 1848–1849 over the refusal by Turkey, with the support of England, to surrender the Hungarian and Polish insurgents who had taken refuge within her borders. It cannot indeed be said that complete tranquillity prevailed throughout the country meanwhile; disturbances in the principalities and in the Lebanon gave serious trouble, while in 1842 the unsettled state of the Turco-Persian frontier nearly led to war. By the mediation of England and Russia the Treaty of Erzerum was signed (1847) and a frontier commission was appointed. But as the frontier was not definitely demarcated the door was left open for controversies which have occurred frequently up to the present day.

Russian Policy since 1829.

Turkey's progress in the path of reform was viewed with some uneasiness in Russia, the cardinal principle of whose policy since 1829 had been to maintain her own influence at Constantinople by keeping the Ottoman government weak. In favour of this view the traditional policy of Peter the Great and Catherine II. had been deliberately given up, and by the secret convention signed at Münchengrätz on the 18th of September 1833 the emperor Nicholas had agreed with his brother sovereigns of the revived "Holy Alliance" to maintain the integrity of Turkey, where Russian influence seemed to have been rendered supreme and permanent by the Treaty of Unkiar Skelessi. The crisis which ended in 1841, however, materially altered the situation from the Russian point of view. By his concert with the other powers in the affair of Mehemet Ali, the tsar had abdicated his claim to a unique influence at Constantinople, and he began to revive the idea of ending the Ottoman rule in Europe, an idea which he had only unwillingly abandoned in 1829 in response to the unanimous opinion of his advisers. In 1844 he took advantage of his visit to England to propose to British ministers a plan of partition, under which Great Britain was to receive Egypt and Crete, Constantinople was to be erected into a free city, and the Balkan states were to become autonomous under Russian protection. This proposal, as might have been expected, only served to rouse suspicions as to Russia's plans; it was politely rejected, and the whole Eastern Question slumbered, until, early in 1850, it was awakened by an incident trivial enough in itself, but pregnant with future trouble: a quarrel of Catholic and Orthodox monks about the holy places in Palestine.

The Holy Places.

By the Capitulations signed on the 28th of May 1740 on behalf of Sultan Mahmud I. and Louis XV. "emperor of France," not only French pilgrims to Jerusalem, but all members of "Christian and hostile nations" visiting the Ottoman Empire, had been placed under the protection of the French flag, and by a special article the Frank, *i.e.* Roman Catholic, ecclesiastics had been guaranteed certain rights in the holy places. These stipulations of the treaty, which were in effect a confirmation of the firman granted in 1620 by Murad IV. to Louis XIII., had fallen into oblivion during the age of Voltaire and the turmoil of the Revolution; and meanwhile, every advance of Russia had been marked by further encroachments of the Orthodox clergy in Palestine on the ancient rights of their Latin rivals. The quarrels of these monks might have been left to the contempt they deserved, had not Napoleon III. seen in the situation an opportunity at once for conciliating the clericals in France and for humiliating Russia, which had given to his title but an equivocal recognition. His ambassador, accordingly, handed in at Constantinople a formal demand for the restitution of the Catholics in all their property and rights. The Ottoman government, seeking to gain time, proposed a "mixed commission" of inquiry; and to this France agreed, on condition that no documents later than 1740 should be admitted as evidence. To this suggestion, which would have excluded the Treaty of Kuchuk Kainarji, the emperor Nicholas replied by a haughty demand that nothing should be altered in the *status quo*. It was now clear that no less an issue was involved than a contest between France and Russia for paramount influence in the East, a contest into which Great Britain would inevitably be dragged. The British government did its best to help the Porte to evolve a compromise on the questions immediately at issue, and in March 1852 a firman was issued, which to Protestants and Mahommedans might well seem to have embodied a reasonable settlement. Concessions were made to one side and the other; and the question of the right of "protection" was solved by the Turkish government itself undertaking the duty. But neither Napoleon nor Nicholas desired a settlement. The French emperor wanted a war for dynastic reasons, the tsar because he conceived his honour to be involved, and because he judged the moment opportune for expelling the infidel from Europe. France, he believed, would never come single-handed to the assistance of Turkey; Austria would be bound at least to benevolent neutrality by "gratitude" for the aid given in 1849; the king of Prussia would sympathize with a Christian crusade; Great Britain, where under the influence of John Bright and Richard Cobden the "peace at any price" spirit seemed to be in the ascendant, would never intervene. Nicholas even hoped for the active sympathy of Britain. Lord Aberdeen made no secret of his dislike for the Turks, and openly expressed his disbelief in the reality of their reforms; and in January 1853 the tsar, in conversation with Sir Hamilton Seymour, the British ambassador at St Petersburg, spoke of the Ottoman Empire as "the Sick Man," and renewed the proposals for a partition made in 1844.

Early in 1853 the Russian army was mobilized, and Prince Menshikov, a bluff soldier devoted to the interests of Orthodoxy and tsardom, was sent to present the emperor's ultimatum at Constantinople. He demanded the recognition of the *status quo* in the holy places, and of the tsar's right, under the Treaty of Kuchuk Kainarji, to the protectorate of all Orthodox Christians in the Ottoman dominions. The Porte, in alarm, turned to Great Britain for advice and assistance. Lord Stratford de Redcliffe, who reached his post at Constantinople shortly after the arrival of Menshikov, at once grasped the essential facts of the situation. The question of the holy places was insignificant in itself—it might be settled if France were granted political compensation elsewhere; that of the protectorate claimed by Russia over the Christians involved the integrity of the sultan's sovereignty. With great address he succeeded in persuading Menshikov to present the two demands separately. On the 22nd of April the French, Russian and British ministers came to an agreement on the question of the holy places; with the result that, when the question of protectorate was raised, Menshikov found himself opposed by the ambassadors of all the other powers. On the 5th of May, nevertheless, in obedience to his peremptory instructions, he presented his ultimatum to the Ottoman government, which, backed now by all the other powers, rejected it. On the 22nd Menshikov and the whole of the Russian diplomatic staff left Constantinople; and it was announced that, at the end of the month, the tsar's troops would enter the Danubian principalities. On the 22nd of June the Russian army, under Prince Gorchakov, crossed the Pruth, not—as was explained in a circular to the powers—for the purpose of attacking Turkey, but solely to obtain the material guarantees for the enjoyment of the privileges conferred upon her by the existing treaties. The news of this aggression roused intense excitement in England; but the British government still exerted itself to maintain peace. In August a conference of the four powers assembled at Vienna, but the settlement they proposed, which practically conceded everything demanded by Russia except the claim to the protectorate, though accepted by the tsar, was rejected by the Porte, now fallen into a mood of stubborn resentment at the Russian invasion. At the beginning of October Turkey formally declared war; on the 22nd the French and British fleets passed the Dardanelles. Lord Aberdeen still hoped to secure peace, and the Russian government was informed that no *casus belli* would arise so long as Russia abstained from passing the Danube or attacking a Black Sea port. To the emperor Nicholas this was tantamount to a declaration of war; and in effect it was so. On the 30th of November the Russian fleet attacked and destroyed a Turkish squadron in the harbour of Sinope; on the 3rd of January the combined French and British fleets entered the Black Sea, commissioned to "invite" the Russians to return to their harbours.

Crimean War.

The emperor Nicholas had been singularly misled as to the state of public opinion in Europe. The news of the affair of Sinope, rather wanton slaughter than a battle, raised excitement in England to fever heat; while the excellent bearing and consistent successes of the Turkish troops during the first months of the campaign on land excited the admiration of all Europe. The belief in the rejuvenation of Turkey seemed to be justified; and when, on the 27th of March 1854, Great Britain and France declared war on Russia, the action of the governments was supported by an overwhelming public opinion. As regards Austria, too, the emperor Nicholas was no less mistaken. If she maintained neutrality, it was due to no impulse of gratitude, and it was far from "benevolent." As the Russians withdrew from the Danubian principalities, Austrian troops occupied them, and by a convention with the Porte the Austrian government undertook to resist by arms any attempt of the Russians to return. So far as the extreme claims of the tsar were concerned, neither Austria nor Prussia was willing to concede them, and both had joined with France and Great Britain in presenting, on the 12th of December 1853, an identical note at St Petersburg, drawn up at the Conference of Vienna, reaffirming the principles of the treaty of 1841. Save for the benevolent neutrality of Prussia, therefore, which enabled her to obtain supplies from the north, Russia was pitted single-handed against a coalition of Turkey, Great Britain and France, to which Sardinia was added later.

The events of the war that followed are told elsewhere (see Crimean War). The main operations were confined to the Crimea, where the allied troops landed on the 14th of September 1854, and they were not concluded, in spite of the terrible exhaustion of Russia, till in December 1855 the threatened active intervention of Austria forced the emperor Alexander II. to come to terms. These terms were ultimately embodied in the Treaty of Paris of the 30th of March 1856. Its provisions, held by some to be so unduly favourable to Russia as to justify the question whether she had not been victorious in the war, were as follows: Russia abandoned all pretensions to exercise a protectorate over the Christians in Turkey, or to an exclusive right of interference in the Danubian principalities, to which Bessarabia was restored; the navigation of the Danube was made free and placed under the supervision of an international commission; the Black Sea was closed to warships, while open to the commercial flags of all countries; the Asiatic frontier between the two empires remained unchanged; Turkey was admitted to the concert of Europe, and all the contracting parties agreed to respect her independence and the integrity of her territory; moreover, the provisions of the Tanzimāt were reaffirmed in a fresh decree of the sultan, which was incorporated in the treaty, and further provided for a large measure of local autonomy for the Christian communities. It was stipulated that Turkey's promises of reform gave no power the right of interference on behalf of the Christians.

The Treaty of Paris was regarded as opening a new era in the progress of Turkey. Admitted on equal terms to the European family of nations, the Ottoman government had given a solemn guarantee of its intention to make the long-promised reforms a reality. But it soon became apparent that the time was scarcely come for liberal measures; and fanatical outbreaks at Jidda (1858) and in Syria (1860) gave proof that the various sections of the population were not yet prepared to act together in harmony. The Syrian disturbances brought about a French occupation, which Fuad Pasha, ably seconded by Ahmed Vefyk Effendi, the Turkish ambassador in Paris, contrived to restrict, and to terminate as soon as possible. The immediate local result was the institution, by a *règlement*,[1] signed at Constantinople on the 6th of September 1864, of autonomy for the Lebanon under a Christian governor appointed by the powers with the concurrence of the Porte, an arrangement which has worked satisfactorily until the present day. In 1859 the Danubian principalities, deliberately left separate by the Congress of Paris, carried out their long-cherished design of union by electing Prince Cuza both in Moldavia and in Walachia, a contingency which the powers had not taken into account, and to which in the end they gave a grudging assent (see RUMANIA).

The New Era.

On the 25th of June 1861 Sultan Abd-ul-Mejid died, being succeeded by his brother Abd-ul-Aziz. The new sultan's reign marked, if not the beginning, at least the high tide of that course of improvident and unrestrained expenditure, facilitated by the enthusiasm created in Europe by Turkey's admission to the ranks of the powers which loosened for her the purse-strings of the foreign investor. The viceroy of Egypt, Ismaïl Pasha, followed his suzerain's example in this respect, and was lavish in his bribes to his imperial overlord to obtain the extension of his own privileges and the establishment in Egypt of succession from father to son; these concessions were granted to him by the *firmans* of the 27th of May 1866 and the 8th of June 1867, in the latter of which the viceroy is addressed for the first time as "khedive." Abd-ul-Aziz is said to have yielded the more readily as being desirous of bringing about a similar alteration in the succession in Turkey, in favour of his own eldest son, Prince Yussuf Izz-ed-din; public opinion was, however, opposed to so sweeping a change, and the succession to the throne in Turkey still goes to the eldest surviving member of the house of Osman. Though the foreign relations of Turkey remained untroubled, disturbances in Servia, Montenegro and Crete continued throughout the "sixties." Servia had long resented the occupation of her fortresses by Turkish troops; frequent collisions arising from this source resulted in June 1862 in the bombardment of Belgrade; some slight concessions were then made to Servia, but it was not until 1867 that, through the mediation of England and other powers, she succeeded in obtaining the withdrawal of the Turkish garrisons. The Cretan insurrection rose to a formidable height in 1868–69, and the active support given to the movement by Greece brought about a rupture of relations between that country and Turkey. The revolt was suppressed, the Turko-Greek conflict was settled by a conference of the powers in Paris, and Crete received a charter of local self-government which for a time pacified the island.[2]

Abd-ul-Aziz, 1861–1876.

Abd-ul-Aziz had visited the Paris Exhibition of 1867 and had paid his respects to Queen Victoria, who conferred on him the order of the Garter. In 1869 the visit was returned by many sovereigns and princes on their way to the opening of the Suez Canal, among these being the empress Eugénie. An important event not to be passed over without mention is the grant on the 10th of March 1870 of the *firman* instituting the Bulgarian exarchate, thus severing the Bulgarian Church from the jurisdiction of the Greek patriarch of Constantinople. This concession, given under strong pressure from Russia, aroused the deepest resentment of the Greeks, and was the principal factor in the awakening of the Bulgarian national spirit which subsequent events have done so much to develop. Russian influence at Constantinople had been gradually increasing, and towards the end of 1870 the tsar took advantage of the temporary disabling of France to declare himself no longer bound by those clauses of the Treaty of Paris which restricted Russia's liberty of possessing warships on the Black Sea. An international conference convoked in London early in 1871 laid down the principle that treaty engagements were binding, and then proceeded to abrogate this particular engagement. Russia and Turkey thus regained full liberty as regards their naval forces and armaments in the Euxine; the passage of the straits remained interdicted to ships of war.

A reform not unworthy of notice was effected by the law promulgated on the 18th of June 1867 whereby foreigners were for the first time allowed to hold landed property throughout the Ottoman Empire (save in the Hejaz) on condition of their being assimilated to Ottoman subjects, *i.e.* divested of their right to the protection of their own authorities in every respect concerning such property.

Meanwhile in Turkey national bankruptcy was brought within measurable distance by the sultan's extravagance and the incompetence of his ministers; it was staved off only by loans contracted almost annually to pay the interest on their predecessors. External influences and latent fanaticism were active; a serious insurrection broke out in Bosnia and Herzegovina in 1875, and the efforts to quell it almost exhausted Turkey's resources; the example spread to Bulgaria, where abortive outbreaks in September 1875 and May 1876 led to those cruel measures of repression which were known as "the Bulgarian atrocities,"[3] Mussulman public feeling was inflamed, and an attempt at Salonica to induce a Christian girl who had embraced Islam to return to her faith caused the murder of two foreign consuls by a fanatical mob. The finances of Turkey now collapsed, and the inevitable bankruptcy was declared, whereby more than through any other cause she lost such sympathies as she possessed in western Europe. Turkey's distress was Russia's opportunity; the sultan fell entirely under the influence of General Ignatiev, the tsar's ambassador, and it became evident that the country was hastening to its dissolution. A conspiracy to bring about a change was hereupon formed by certain prominent statesmen, whose leaders were Midhat Pasha, Mehemed Rushdi Pasha and Mahmud Damad Pasha, the husband of a princess of the blood, sister to Prince Murad. These succeeded in gaining over the Sheikh-ul-Islam, and in obtaining from him a *fetva* for the deposition of Abd-ul-Aziz.

Deposition of Abd-ul-Aziz.

In virtue of this judgment of the supreme legal authority, and with the aid of the fleet, Abd-ul-Aziz was deposed, being shortly afterwards found dead, apparently by his own hand. Murad V. reigned in his stead. But the change of sultans brought no relief to the troubled state: Servia and Montenegro declared war, and in less than three months it had become evident that Murad was incapable of governing.

Murad's brother Abd-ul-Hamid was accordingly proclaimed sultan on the 31st of August 1876. The diplomacy of Europe had been searching in vain since the autumn of 1875 for the means of inducing Turkey to institute effective administrative reforms and to grant to its European provinces that autonomy which now appeared essential. But the new sultan was as averse from accepting any of the formulae proposed as were his predecessors: Servia and Montenegro were with great difficulty pacified, but it was plain that Russia, whose Slavonic and Orthodox sympathies had been strongly aroused, would soon begin hostilities herself. Turkey now made a show of going even beyond the demands formulated by Europe, and the international conference which met at Constantinople during

Accession of Abd-ul-Hamid II., 1876.

the last days of 1876 was startled by the salvo of artillery which heralded the promulgation of a liberal constitution, not for the European provinces only, but for the whole empire, and the institution of a Turkish parliament. The decisions of the conference, moderate though they were, in the end requiring merely the nomination of an international commission to investigate the state of the European provinces of Turkey, and the appointment by the sultan, with the approval of the powers, of governors-general for five years, were rejected by the Porte. The statesmen of Europe still continued their efforts to avert a conflict, but to no purpose. On the 24th of April 1877 Russia declared war and her troops crossed the Turkish frontiers. Hostilities were conducted both in Europe and Asia for nearly a year. Rumania joined the Russians, and in Europe no effective opposition was encountered by the invaders until the assaults on Plevna and the Shipka Pass, where the valiant resistance of the Turks won for them the admiration of Europe. By November the defence of the Turks in Asia Minor had entirely collapsed. Plevna surrendered on the 9th of December 1877 after a heroic struggle under Osman Pasha. Thereafter the Russians advanced practically unchecked (see RUSSO-TURKISH WARS). An armistice and preliminaries of peace were signed on the 31st of January 1878 at Adrianople, and a definitive treaty was concluded at San Stefano on the 3rd of March 1878. Its terms were: the creation of an autonomous tributary principality of Bulgaria extending from the Black Sea to the Aegean; the recognition by Turkey of the independence of Rumania, Servia and Montenegro, with increased territories; the payment of a war indemnity; the introduction of reforms in Bosnia and Herzegovina; the cession to Russia of Bessarabia and the Dobruja; the opening of the passage of the straits at all times to the merchant vessels of neutral states; and the razing of the fortresses on the Danube.

Russo-Turkish War.

Treaty of San Stefano.

Great Britain had throughout the war preserved strict neutrality, but, while making it clear from the outset that she could not assist Turkey, had been prepared for emergencies. Turkey's severity in repressing the Bulgarian insurrection had raised up in England a storm of public opinion against her, of which the Liberal opposition had taken the fullest advantage; moreover the suspension of payments on the Ottoman debt had dealt Turkey's popularity a blow from which it had never recovered. But upon the approach of the Russians to Constantinople the British reserves were called out and the fleet was despatched to the Bosporus. Accordingly, and as her line of retreat might be threatened by Austria, Russia consented to a revision of the Treaty of San Stefano at a congress to be held at Berlin. Before the meeting of this congress, which assembled on the 13th of June 1878, the powers principally interested had arrived at an understanding as to the modifications to be introduced in the treaty, and by a convention concluded with Turkey on the 4th of June 1878 England had undertaken to defend the Asiatic dominions of the sultan by force of arms, provided that his majesty carried out all the necessary reforms, to be agreed upon later, and assigned to England the island of Cyprus, which was however to be restored if Turkey fulfilled her engagements as to reforms and if Russia gave back to her Kars, Ardahan and Batum. On the 13th of July 1878 the Treaty of Berlin was signed: the Great Bulgaria of the San Stefano Treaty was diminished to an autonomous province north of the Balkans, the south-eastern portion, no longer extending to the Aegean, was formed into a self-governing tributary province styled Eastern Rumelia; Turkey abandoned all pretension to suzerainty over Montenegro; Servia and Rumania received their independence (but the last named was made to cede Bessarabia to Russia, receiving instead the Dobruja); the Asiatic frontier was readjusted, Kars, Ardahan and Batum becoming Russian. It was further provided that Bulgaria should pay to Turkey an annual tribute, and should moreover (as well as the other Balkan states receiving accessions of territory at Turkey's expense) bear a portion of the Ottoman debt. The sums payable by the different countries were to be fixed by the powers; but no effect has so far been given to this reasonable stipulation, which may now be looked upon as null and void. Turkey undertook to pay to Russia a war indemnity of 300,000,000 roubles, and the status of the straits remained unchanged. Measures of reform in Armenia were also provided for, as also the convocation of an international commission for drawing up a reform scheme for the European provinces left to Turkey. The organic law for Crete was to be carried out, and special laws enacted for other parts of Turkey. Bosnia and Herzegovina were handed over to the administration of Austria; Montenegro and Greece received accessions of territory to which only strong pressure coupled with a naval demonstration induced Turkey to consent three years later.

Congress of Berlin, 1878.

Peace once restored, some attempt was made by Turkey in the direction of complying with her engagements to institute reform. Financial and military advisers were procured from Germany. English officers were engaged to reform the gendarmerie, and judicial inspectors of foreign nationality were to travel through the country to redress abuses. It was not long before the unsubstantial character of all these undertakings became apparent; the parliament was dissolved, the constitution was suspended and its author exiled. Egyptian affairs next threatened complications. In May 1879 the misgovernment of Ismaïl Pasha and the resulting financial crisis rendered the deposition of the khedive inevitable; in order to anticipate the action of England and France, who would otherwise have expelled the erring viceroy, the sultan deposed him himself; the succession devolved upon his son Mahommed Tewfik Pasha. (For the subsequent history of the Egyptian question see EGYPT: *History*.) The revolt of Arabi Pasha in 1881 broke up the Anglo-French condominium in Egypt and led to outrages at Alexandria followed by a bombardment on the 11th of July 1882. The occupation of the country by Great Britain gradually took a more permanent form, and though negotiations were more than once entered into with Turkey with a view to its termination, these either proved abortive or were rendered so (as *e.g.* the Drummond-Wolff convention of 1887) by the action of other powers. The Anglo-French agreement of 1904 left England in undisputed mastery.

The Egyptian Question.

The financial straits of Turkey after the war became so acute that the sultan was compelled to consent to a measure of foreign control over the finances of the country; the administration of the public debt being established in December 1881. (See *Finance*, above.)

Public Debt.

In 1885 the practically bloodless revolution of Philippopolis on the 18th of September united Bulgaria and Eastern Rumelia, severed by the Treaty of Berlin. A conference held at Constantinople sanctioned the union on terms which were rendered acceptable to the sultan; but Said Pasha, who had assisted the sultan in centralizing at Yildiz Kiosk the administration of the country, and who had become grand vizier, was a strong adherent of the policy of armed intervention by Turkey, and the consequence was his fall from office. His successor in the grand vizierate, Kiamil Pasha, was soon called upon to deal with Armenian unrest, consequent on the non-execution of the reforms provided for in the Treaty of Berlin and the Cyprus Convention, which first found vent about 1890. But Kiamil Pasha was not subservient enough to his imperial master's will, and his place was taken by a military man, Jevad Pasha, from whom no independence of action was to be apprehended.

It is from this period that the German ascendancy in Constantinople is noticeable. Railway concessions were given to Germans over the heads of British applicants already in possession of lines from which they were expropriated, thus affording the nucleus of the Bagdad railway (of which Germany obtained the concession in November 1899). (See BAGDAD, vol. iii. p. 197.)

German Activity in Turkey.

From 1890 Crete was frequently the scene of disturbance; the Christian communities in other parts of Turkey began to chafe under the attempted curtailing of their privileges; about Christmas 1893 the Greek patriarch caused all the Orthodox churches to be closed as a protest; and the Armenian agitation entered upon a serious phase. The Kurds, the constant oppressors of that people, had received official recognition and almost complete immunity from the control of the civil law by being formed into a yeomanry frontier-guard known as the Hamidian cavalry. The troubles arising from this cause and from greater energy in the collection of taxes led the Armenians in outlying and mountainous districts to rise against the authorities. The repression of these revolts in the Sassun district in the autumn of 1894 was effected under circumstances of great severity by Turkish troops and Kurdish irregulars. A commission composed of British, French and Russian officials held an inquiry into the events which had occurred, and early in 1895 England, France and Russia entered actively into negotiations with a view to the institution of reforms. The scheme propounded by the three powers encountered great objections from the Porte, but under pressure was accepted in October 1895. Its acceptance was however the signal for a series of massacres in almost every town of importance throughout Asia Minor, which there is but too strong evidence for suspecting were committed with the connivance of the authorities, and in which upwards of 200,000 persons are computed to have perished. In 1896 Lord Salisbury induced the other powers to unite in urging the execution of the reforms, but no agreement could be come to for the use of coercion, and Europe could but look on and protest. Changes of ministry at Constantinople were powerless to bring about an improvement, and early in 1896 Cretan affairs became so serious as to call for the intervention of the powers. In September yet another Cretan charter of self-government was promulgated. Shortly before, a revolutionary attack by an Armenian band on the Ottoman bank at Constantinople brought about a general massacre of Armenians in the capital (where a widespread revolutionary organization undoubtedly existed), in which at least 3000 victims fell, and the persecution of Armenians became the order of the day.

Armenian Troubles.

The neglect of the Porte to carry out all the stipulations of the Cretan arrangement of 1896 led to a renewal of the disturbances, and Greece began to take steps for the invasion of the island; in February 1897 Colonel Vassos sailed from the Piraeus with an armed force, intending to proclaim the annexation of Crete to Greece, and Greek troops were massed on the Thessalian frontier. Diplomacy busied itself with fruitless attempts to avert hostilities; on the 17th of April 1897 war was declared by Turkey. The resistance offered by Greece was feeble in the extreme: Europe was obliged to intervene, and Turkey gained a rectification of frontier and a war indemnity of £4,000,000, besides the curtailment by the treaty eventually signed of many privileges hitherto enjoyed by Hellenic subjects in Turkey. But Europe was determined that the Cretan question should be definitely settled, at least for a period of some years, and, after an outbreak at Candia, in which the lives of British troops were sacrificed, the four powers (Germany and Austria having withdrawn from the concert) who had taken over the island *en dépôt* handed it over in October 1898 to Prince George of Greece as high commissioner (see CRETE: *History*).

Greek War of 1897.

Crete being thus removed from the scope of her action, Turkey found ample occupation in the almost constant turbulence of the Yemen, of Albania and of Macedonia. After 1892 the revolts, frequently renewed, of the so-called imam of Sana, necessitated the despatch of large and costly expeditions to Arabia, in which thousands of Turkish troops have fallen in guerrilla warfare or through the inhospitable climate; in Albania disturbance became almost endemic, owing to the resistance offered by the intractable population to successive attempts of the central authorities to subject the country to regular taxation and the operation of the laws.

Revolts in Arabia.

Unsettled claims by French citizens led to a breaking off of relations and the occupation of Mitylene by France in November 1901; the rupture was of short duration and Turkey soon gave way, according complete satisfaction both in this matter and on certain other French demands. In 1901 and 1902 Turkish encroachments on the hinterland of Aden brought about a dangerous state of tension between Great Britain and Turkey, which had its parallel in 1906 in similar trespasses by the Ottoman authorities on the Egyptian land frontier near Akaba. In both cases Turkey eventually yielded; a similar question arose in 1906 with France over the boundaries of the African possessions of the two countries.

Disputes with France and Britain.

But Macedonia was Turkey's chief source of anxiety. That country, left by the Treaty of Berlin with its status unaltered, was in a continued condition of disturbance. The Christian population, who in common with their Mussulman fellow subjects suffered from the defective methods of government of their rulers, had at least before them the example of their brethren—Greeks, Bulgarians or Servians—dwelling in independent kingdoms under Christian governments on the other side of the frontier. The hope of eventual emancipation was stimulated by sedulous propagandists from each of these countries; from time to time armed bands of insurgents were manned and equipped in the small neighbouring states, with or without the co-operation of the governments. So long as Stambolov, the energetic Bulgarian statesman, was alive he succeeded in keeping the Bulgarian element quiet, and the peace of the country was less liable to disturbance. But for some years the three rivals in Macedonia, to which a fourth, the Rumanian element, must be added, were in constant strife (see MACEDONIA). A serious Bulgarian insurrection in Macedonia in the autumn of 1903 induced Austria and Russia to combine in formulating the Mürzsteg reform programme, tardily consented to by Turkey, by which Austrian and Russian civil agents were appointed to exercise a certain degree of control and supervision over the three vilayets of Salonica, Monastir and Kossovo. It was also arranged that foreign officers should be named to reorganize the gendarmerie. An Italian officer, General De Giorgis, was appointed to the chief command in the reorganization, and the three vilayets were apportioned among the great powers into districts, in each of which was appointed a staff officer with a number of subordinate officers of his nationality under his orders. The work of reorganization was efficiently carried out, and the gendarmerie school at Salonica, under British supervision, showed excellent results. But the achievements of the two civil agents were less noteworthy; and in 1905 it was agreed that, in view of the financial necessities of the provinces, the other great powers should each appoint delegates to a financial commission with extensive powers of control in fiscal matters. The Porte opposed the project, and an international naval demonstration and the occupation of Mytilene by the powers became necessary before Turkey gave way in December 1905. Even so it proved impossible to fulfil the Mürzsteg programme, though the attempt was prolonged until 1908. The Austro-Russian *entente* had then come to an end; and after a meeting between King Edward VII. and the tsar Nicholas II. at Reval, a new scheme of reforms was announced, under the name of the "Reval programme." The enforcement of these reforms, however, was postponed *sine die* owing to the revolution which transformed the Ottoman Empire into a constitutional state; and the powers, anticipating an improvement in the administration of Macedonia by the new government, withdrew their military officers in the summer of 1908.

Macedonian Question.

The Young Turkish party had long been preparing for the overthrow of the old régime. Their central organization was in Paris and their objects were known throughout Europe, but except at Yildiz Kiosk their power was almost everywhere underrated. The Porte strove by every means at its disposal to thwart their activity; but elsewhere they were regarded as a body of academic enthusiasts, more noisy than dangerous, who devoted their scanty funds to the publication of seditious matter in Paris or Geneva, and sought to achieve the impossible by importing western institutions into a country fit only to be ruled by the *sheriat* and the sword. Such was the opinion held even by experienced diplomatists and by historians. It was strengthened by the fact that the Young

The Young Turks.

Turks had deliberately abstained from violent action. They had, in fact, learned from events in Russia and Poland that sporadic outbreaks on a small scale would inevitably discredit their cause, and that a successful revolution would require the support of the army. To gain this, an extensive propaganda was carried on by secret agents, many of whom were officers. At the beginning of 1908 a favourable opportunity for action arrived. The Ottoman troops in Arabia were mutinous and unpaid; the Albanians, long the mainstay of Turkish military power in the west, had been irritated by unpopular taxes and by the repressive edicts which deprived them of schools and a printing-press; foreign interference in Crete and Macedonia was resented by patriotic Moslems throughout the empire. In these circumstances the headquarters of the Young Turks were transferred from Paris to Salonica, where a central body, known as the committee of union and progress, was established (1908) to organize the revolution. Most of its members were military officers, prominent among them being Majors Enver Bey and Niazi Bey, who directed the propaganda in Albania and Macedonia. By midsummer the Albanian leaders and the greater part of the Turkish army in Europe had sworn fidelity to the constitution.

On the 25th of May an insurrection broke out in Samos, owing to a dispute between the Samian Assembly and Kopassis Effendi, "prince," or governor of the island. After the port of Vathy had been bombarded by Ottoman war-ships the revolt was easily crushed.

This affair however was of little more than local importance, and the Young Turks were not directly concerned in it. They struck their first blow on the 22nd of July 1908, when Niazi Bey and his troops raised the standard of revolt at Resna, a town on the road from Monastir to Ochrida. On the 23rd the committee of union and progress, under the presidency of Enver Bey, proclaimed the constitution in Salonica, while the second and third army corps threatened to march on Constantinople if the sultan refused to obey the proclamation. On the 24th the sultan yielded, and issued an *iradē*, restoring the constitution of 1876, and ordering the election of a chamber of deputies. Various other reforms, notably the abolition of the spy system and the censorship, were announced soon afterwards. Some of the more unpopular officials associated with the old régime were assassinated, among them Fehim Pasha, the former head of the espionage department, who had been exiled to Brusa in 1907 at the request of the British and German ambassadors. Otherwise the revolution was effected almost without bloodshed; for a time the insurgent bands disappeared in Macedonia, and the rival "nationalities"—Greek, Albanian, Turk, Armenian, Servian, Bulgarian and Jew—worked harmoniously together for the furtherance of common constitutional aims. On the 6th of August Kiamil Pasha, an advanced Liberal, became grand vizier, and a new cabinet was formed, including a Greek, Prince Mavrocordato, an Armenian, Noradounghian, and the Sheikh-ul-Islam.

The Revolution of 1908.

The success of the Young Turks created a serious situation for the statesmen of Austria-Hungary and Bulgaria. A regenerated Ottoman Empire might in time be strong enough to demand the evacuation of Bosnia and Herzegovina, and to maintain or extend the nominal suzerainty over Bulgaria which the sultan had exercised since 1878. Accordingly, at the beginning of October 1908, the emperor Francis Joseph informed the powers signatory to the treaty of Berlin that the annexation of Bosnia and Herzegovina to the Dual Monarchy had become necessary, and this decision was formally announced in an imperial rescript dated the 7th of October. The independence of Bulgaria was proclaimed on the 5th. The Ottoman government protested to the powers, but it wisely limited its demands to a claim for compensation. Austria-Hungary had from the first undertaken to withdraw its garrisons from the sanjak of Novibazar—an important concession; after prolonged negotiations and a boycott of all Austrian goods exported to Turkey, it also agreed to pay £2,200,000 as compensation for the Turkish crown lands seized in Bosnia and Herzegovina. This arrangement was sanctioned by the Ottoman parliament, which assented to the annexation on the 6th of April 1909 and recognized the independence of Bulgaria on the 19th of April, the Russian government having enabled Bulgaria to pay the indemnity claimed by Turkey on account of the Eastern Rumelian tribute and railways (see BULGARIA: *History*). On the 3rd of February 1910 the Porte accepted a Bulgarian proposal for a mixed commission to delimit disputed sections of the Turco-Bulgarian frontier, and in March King Ferdinand visited Constantinople.

Bosnia and Bulgaria.

Meanwhile the Young Turks were confronted with many difficulties within the empire. After the first fervour of enthusiasm had subsided the Christian nationalities in Macedonia resumed their old attitude of mutual jealousy, the insurgent bands began to reappear, and the government was in 1909–1910 forced to undertake the disarmament of the whole civil population of the three vilayets. In Albania serious discontent, resulting in an insurrection (May-September 1909), was caused by the political rivalry between Greeks and Albanians and the unwillingness of the Moslem tribesmen to pay taxes or to keep the peace with their neighbours, the Macedonian Serbs. In Asia Minor the Kurdish troops under Ibrahim Pasha revolted, and, although they were defeated with the loss of their commander, the Kurds continued to attack indiscriminately the Turks, Nestorians and Armenians; disturbances also broke out among the other reactionary Moslems of this region, culminating in a massacre of the Armenians at Adana. In Arabia Ratib Pasha, the Turkish commander-in-chief, joined the enemies of the new régime; he was defeated and captured in the autumn of 1908, but in the following year frequent raids upon the Hejaz railway were made by Bedouin tribesmen, while a Mahdist rebellion broke out and was crushed in Yemen.

The Reaction in the Provinces.

More serious than any of these local disturbances was the counter-revolution in Constantinople itself, which began with the revolt of Kiamil Pasha, the grand vizier, against the authority of the committee of union and progress. Kiamil Pasha was forced to resign (Feb. 14, 1909) and was succeeded by Hilmi Pasha, ex-high commissioner of Macedonia. Strife then arose between the committee and the Liberal Union, a body which mainly represented the Christian electorate, and on the 5th of April Hassan Fehmi Effendi, who edited the *Serbesti*, the official organ of the union, was assassinated. He was an Albanian, and his fellow countrymen in the Constantinople garrison at once made common cause with the opponents of the committee. Mutinous troops seized the parliament house and the telegraph offices; the grand vizier resigned and was succeeded by Tewfik Pasha (April 14); and delegates were sent by the Liberal Union, the association of Ulema and other bodies to discuss terms with the committee. But Abd-ul-Hamid had issued a free pardon to the mutineers, and the committee had now decided that the new régime would never be secure while the sovereign favoured reaction. They refused to treat with the delegates, and despatched 25,000 men under Mahmud Shevket to Constantinople.

The Constantinople Counter-revolution.

The senate and chamber met at San Stefano, and, sitting jointly as a National Assembly, issued a proclamation in favour of the committee and its army (April 22, 1909), by which Constantinople was now invested. Part of the garrison remained loyal to the sultan, but after five hours of severe fighting Shevket Pasha was able to occupy the capital (April 25). The National Assembly met in secret session two days later, voted unanimously for the deposition of Abd-ul-Hamid II., and chose his younger brother Mahommed Reshad Effendi (b. Nov. 3, 1844) as his successor, with the style of Mahommed V. Abd-ul-Hamid II. was removed to Salonica on the 28th, and on the 10th of May the new sultan was formally invested with the sword of Osman. Hilmi Pasha again became grand vizier, but resigned on the 28th of December 1909, when he was succeeded by Hakki Bey. On the 5th of August 1909 the new constitution described above was

The New Régime.

promulgated by imperial *iradē*; parliament was prorogued for three months on the 27th, and during the recess the committee of union and progress met at Salonica and modified its own rules (Oct. 23), ceasing thenceforward to be a secret association. This was regarded as an expression of confidence in the reformed parliament, which had laid the foundation of the important financial and administrative reforms already described. On the 13th of September 1909 the Macedonian international commission of finance met for the last time; its members were reappointed to a higher finance board for the whole empire, under the presidency of Djavid Bey. Ch. Laurent had already been nominated financial adviser to the empire (Sept. 16, 1908), while Sir William Willcocks became head of the irrigation department; the reorganization of the army was entrusted to the German General von der Goltz, that of the navy to Admiral Sir Douglas Gamble (resigned Feb. 1, 1910).

Crete, Greece and Rumania. The evacuation of Crete by the four protecting powers was followed in 1909 by renewed agitation. Turkey was willing to concede the fullest local autonomy, but not to abandon its sovereign rights over the island. In July 1909, however, the Greek flag was hoisted in Canea and Candia, and it was only lowered again after the war-ships of the protecting powers had been reinforced and had landed an international force. The Cretan administrative committee swore allegiance to the king of the Hellenes in August, and again, after a change of government, at the end of December 1909. This situation had already given rise to prolonged negotiations between Greece and Turkey. It also contributed towards the conclusion of an *entente* between Turkey and Rumania in the summer of 1910. Both of these powers were interested in preventing any possible accession of territory to the Bulgarian kingdom; and Rumania (*q.v.*) had for many years been a formidable opponent of Hellenism among the Macedonian Vlachs. Greece and Crete were thus confronted with what was in effect a defensive alliance between Turkey and Rumania. The Cretans had insisted upon their demand for union with Greece and had elected three representatives to sit in the Greek national assembly. Had this act been ratified by the government at Athens, a war between Greece and the Ottoman Empire could hardly have been avoided; but a royal rescript was issued by the king of the Hellenes on the 30th of September 1910, declaring vacant the three seats to which the Cretan representatives had been elected; the immediate danger was thus averted.

BIBLIOGRAPHY.—(1) *General Historical Works*: The monumental *Geschichte des Osmanischen Reiches*, by J. von Hammer Purgstall (1st ed., 10 vols., Vienna, 1827–1835; 2nd ed., 4 vols., Pest, 1840; French trans., by J. J. Hellert, 18 vols., Paris, 1835–1843), is still the standard work until the conclusion of the treaty of Kuchuk Kai'narji (1744), at which date it stops. Founded upon it are Sir E. S. Creasy's *History of the Ottoman Turks* (London, 1878) and S. Lane-Poole's *Turkey* in the "Story of the Nations Series" (London, 1888); Sutherland Menzies's *Turkey, Old and New* (2 vols., 1880) is derived chiefly from French sources and is less accurate and unbiased. An excellent and impartial history in Turkish is the *Tarikh-i-devlet-i-osmanié*, by Abdurrahman Sheref (Constantinople, A.H. 1315–1318 = A.D. 1897–1900). *The Balkans*, by W. Miller (London, 1899), in the "Story of the Nations Series," deals with Turkey's relations with the Balkan states. Halil Ganem's *Les Sultans ottomans* (2 vols., Paris, 1902) contains much that is interesting, if not always entirely trustworthy.

2. *Monographs*: Much information on modern Turkish history and politics will be found in the works dealing primarily with topography, finance, law and defence, which have been cited above. See also S. Lane-Poole, *Life of Lord Stratford de Redcliffe* (2 vols., London, 1888); A. Vandal, *Mémoires du marquis de Nointel* (French ambassador at Constantinople from 1670 to 1678); E. Engelhardt, *La Turquie et le Tanzimat* (Paris, 1882); E. Driault, *La Question d'orient depuis ses origines jusqu'à nos jours* (Paris, 1898); V. Bérard, *La Turquie et l'Hellénisme* (Paris, 1897); idem, *Le Sultan, l'Islam et les Puissances* (Paris, 1907); idem, *La Révolution turque* (1909).

3. *Official Publications and Collections of Treaties*: Sir E. Hertslet's *Treaties Regulating the Trade, &c., between Great Britain and Turkey* (London, 1875) presents a summary of all the principal treaties between Turkey and other states; see also Gabriel Effendi Noradounghian, *Recueil d'actes internationaux de l'empire ottoman, 1300–1789*, t. i. (Paris, 1897). Much valuable information is to be obtained from parliamentary papers. These are too numerous for detailed mention, but the following periods may be cited as the most interesting: 1833–1841 (Egyptian question); 1849–1859 (Crimean War and the events by which it was preceded and followed); 1868–1869 (Cretan insurrection); 1875–1881 (Bosnian and Herzegovinian insurrection, Russo-Turkish War, Berlin treaty and subsequent events); 1885–1887 (union of Eastern Rumelia with Bulgaria); 1889–1890 (Cretan disturbances); 1892–1899 (Armenian and Cretan affairs); 1902–1907 (Macedonia); 1908–1910 (revolution and reform). Some analysis of the unpublished documents in the record office, for the period 1815–1841, by W. Alison Phillips, will be found in the bibliographies to chs. vi. and xvii. of vol. x. of the *Cambridge Modern History*. (X.)

Literature.

In all literary matters the Ottoman Turks have shown themselves a singularly uninventive people, the two great schools, the old and the new, into which we may divide their literature, being closely modelled, the one after the classics of Persia, the other after those of modern Europe, and more especially of France. The old or Persian school flourished from the foundation of the empire down to about 1830, and still continues to drag on a feeble existence, though it is now out of fashion and cultivated by none of the leading men of letters. These belong to the new or European school, which, in spite of the bitter opposition of the partisans of the old Oriental system, has succeeded, partly through its own inherent superiority and partly through the talents and courage of its supporters, in expelling its rival from the position of undisputed authority which it had occupied for upwards of five hundred years. For the present purpose it will be convenient to divide the old school into three periods, which may be termed respectively the pre-classical, the classical and the post-classical. Of these the first extends from the early days of the empire to the accession of Suleimān I., 1301–1520 (700–926); the second from that event to the accession of Maḥmūd I., 1520–1730 (926–1143); and the third from that date to the accession of 'Abd-ul-'Azīz, 1730–1861 (1143–1277).

Old School.

General Character of Ottoman Literature. The works of the old school in all its periods are entirely Persian in tone, sentiment and form. We find in them the same beauties and the same defects that we observe in the production of the Iranian authors. The formal elegance and conventional grace, alike of thought and of expression, so characteristic of Persian classical literature, pervade the works of the best Ottoman writers, and they are likewise imbued, though in a less degree, with that spirit of mysticism which runs through so much of the poetry of Irān. But the Ottomans did not stop here: in their romantic poems they chose as subjects the favourite themes of their Persian masters, such as Leylī and Mejnūn, Khusrev and Shīrīn, Yūsuf and Zuleykhā, and so on; they constantly allude to Persian heroes whose stories occur in the *Shāh-Nāma* and other storehouses of Iranian legendary lore; and they wrote their poems in Persian metres and in Persian forms. The mesnevī, the ḳasīda and the ghazel—all of them, so far at least as the Ottomans are concerned, Persian—were the favourite verse-forms of the old poets. A mesnevī is a poem written in rhyming couplets, and is usually narrative in subject. The ḳasīda and the ghazel are both monorhythmic; the first as a rule celebrates the praises of some great man, while the second discourses of the joys and woes of love. Why Persian rather than Arabian or any other literature became the model of Ottoman writers is explained by the early history of the race (see TURKS). Some two centuries before the arrival of the Turks in Asia Minor the Seljūḳs, then a mere horde of savages, had overrun Persia, where they settled and adopted the civilization of the people they had subdued. Thus Persian became the language of their court and government, and when by-and-by they pushed their conquests into Asia Minor, and founded there the Seljūḳ Empire of Rūm, they carried with them their Persian culture, and diffused it among the peoples newly brought under their sway. It was the descendants of those Persianized Seljūḳs whom the early Ottomans found ruling in Asia Minor on their arrival there. What had happened to the Seljūḳs two centuries before happened to the Ottomans now: the less civilized race adopted the culture of the more civilized; and, as the Seljūḳ Empire fell to pieces and the Ottoman came gradually to occupy its place, the sons of men who had called themselves Seljūḳs began thenceforth to look upon themselves as Ottomans. Hence the vast majority of the people whom we are accustomed to think of as Ottomans are so only by adoption, being really the descendants of Seljūḳs or Seljūḳian subjects, who had derived from Persia whatever they possessed of civilization or of literary taste. An extraordinary love of precedent, the result apparently of conscious want of original power, was sufficient to keep their writers loyal to their early guide for centuries, till at length the allegiance, though not the fashion of it, has been changed in our own days, and Paris has replaced Shīrāz as the shrine towards which the Ottoman scholar turns. While conspicuously lacking in creative genius, the Ottomans have always shown themselves possessed of receptive and assimilative powers to a remarkable degree, the result being that the number of their writers both in prose and verse is enormous. Of course only a few of the most prominent, either through the intrinsic merit of their work or through the influence they have had on that of their contemporaries, can be mentioned in a brief review like the present. It ought to be premised that the poetry of the old school is greatly superior to the prose.

Pre-classical Period.

Ottoman literature may be said to open with a few mystic lines, the work of Sultān Veled, son of Maulānā Jelāl-ud-Dīn, the author of the great Persian poem the *Mathnawī*. Sultān Veled flourished during the reign of 'Osmān I., though he did not reside in the territory under the rule of that prince. Another mystic poet of this early time was 'Āshiḳ Pasha, who left a long poem in rhyming couplets, which is called, inappropriately enough, his *Dīwān*. The nocturnal expedition across the Hellespont by which Suleimān, the son of Orkhan, won Galipoli and therewith a foothold in Europe for his race, was shared in and celebrated in verse by a Turkish noble or chieftain named Ghāzī Fāzil. Sheikhī of Kermiyān, a contemporary of Maḥommed I. and Murād II., wrote a lengthy and still esteemed mesnevī on the ancient Persian romance of Khusrev and Shīrīn; and about the same time Yaziji-oghlu gave to the world a long versified history of the Prophet, the *Muḥammedīya*. The writers mentioned above are the most important previous to the capture of Constantinople; but there is little literature of real merit prior to that event. The most notable prose work of this period is an old collection of stories, the *History of the Forty Vezirs*, said to have been compiled by a certain Sheikh-zāda and dedicated to Murād II. A few years after Constantinople passed into the hands of the Ottomans, some ghazels, the work of the contemporary Tatar prince, Mīr 'Alī Shīr, who under the *nom de plume* of Nevāyī wrote much that shows true talent and poetic feeling, found their way to the Ottoman capital, where they were seen and copied by Aḥmed Pasha, one of the viziers of Maḥommed II. The poems of this statesman, though possessing little merit of their own, being for the most part translations from Nevāyī, form one of the landmarks in the history of Ottoman literature. They set the fashion of ghazel-writing; and their appearance was the signal for a more regular cultivation of poetry and a greater attention to literary style and to refinement of language. In Sinān Pasha (d. 1420), another minister of Maḥommed the Conqueror, Ottoman prose found its first exponent of ability; he left a religious treatise entitled *Tazarru'āt* (Supplications), which, notwithstanding a too lavish employment of the resources of Persian rhetoric, is as remarkable for its clear and lucid style as for the beauty of many of the thoughts it contains. The most noteworthy writers of the Conqueror's reign are, after Aḥmed and Sinān, the two lyric poets Nejātī and Zātī, whose verses show a considerable improvement upon those of Aḥmed Pasha, the romantic poets Jemālī and Hamdī, and the poetesses Zeyneb and Mihrī. Like most of his house, Maḥommed II. was fond of poetry and patronized men of letters. He himself tried versification, and some of his lines which have come down to us appear quite equal to the average work of his contemporaries. Twenty-one out of the thirty-four sovereigns who have occupied the throne of 'Osmān have left verses, and among these Selīm I. stands out, not merely as the greatest ruler, warrior and statesman, but also as the most gifted and most original poet. His work is unhappily for the greater part in the Persian language; the excellence of what he has done in Turkish makes us regret that he did so little. The most prominent man of letters under Selīm I. was the legist Kemāl Pasha-zāda, frequently called Ibn-Kemāl, who distinguished himself in both prose and verse. He left a romantic poem on the loves of Yūsuf and Zuleykhā, and a work entitled *Nigāristān*, which is modelled both in style and matter on the *Gulistān* of Sa'dī. His contemporary, Mesīhī, whose beautiful verses on spring are perhaps better known in Europe than any other Turkish poem, deserves a passing mention.

Classical Period.

With the accession of Selīm's son, Suleimān I., the classical period begins. Hitherto all Ottoman writing, even the most highly finished, had been somewhat rude and uncouth; but now a marked improvement becomes visible alike in the manner and the matter, and authors of greater ability begin to make their appearance. Fuzūlī (d. 1563), one of the four great poets of the old school, seems to have been a native of Bagdad or its neighbourhood, and probably became an Ottoman subject when Suleimān took possession of the old capital of the caliphs. His language, which is very peculiar, seems to be a sort of mixture of the Ottoman and Āzerbaijān dialects of Turkish, and was most probably that of the Persian Turks of those days. Fuzūlī showed far more originality than any of his predecessors; for, although his work is naturally Persian in form and in general character, it is far from being a mere echo from Shīrāz or Isfahān. He struck out a new line for himself, and was indebted for his inspiration to no previous writer, whether Turk or Persian. An intense and passionate ardour breathes in his verses, and forms one of the most remarkable as well as one of the most attractive characteristics of his style; for, while few even among Turkish poets are more artificial than he, few seem to write with greater earnestness and sincerity. His influence upon his successors has scarcely been as far-reaching as might have been expected—a circumstance which is perhaps in some measure owing to the unfamiliar dialect in which he wrote. Besides his *Dīwān*, he left a beautiful mesnevī on the story of Leylī and Mejnūn, as well as some prose works little inferior to his poetry. Bāḳī (d. 1599) of Constantinople, though far from rivalling his contemporary Fuzūlī, wrote much good poetry, including one piece of great excellence, an elegy on Suleimān I. The Ottomans have as a rule been particularly successful with elegies; this one by Bāḳī has never been surpassed. Rūhi, Lāmi'ī, Nev'ī, the janissary Yahya Beg, the muftī Ebū-Su'ūd and Selīm II. all won deserved distinction as poets. During the reign of Aḥmed I. arose the second of the great poets of the old Ottoman school, Nef'ī of Erzerūm, who owes his preeminence to the brilliance of his ḳasīdas. But Nef'ī could revile as well as praise, and such was the bitterness of some of his satires that certain influential personages who came under his lash induced Murād IV. to permit his execution. Nef'ī, who, like Fuzūlī, formed a style of his own, had many to imitate him, of whom Ṣabrī Shākir, a contemporary, was the most successful. Nā'ilī, Jevrī and Fehīm need not detain us; but Nābī (d. 1712), who flourished under Ibrāhīm and Maḥommed IV., calls for a little more attention. This prolific author copied, and so imported into Ottoman literature, a didactic style of ghazel-writing which was then being introduced in Persia by the poet Ṣā'ib; but so closely did the pupil follow in the footsteps of his master that it is not always easy to know that his lines are intended to be Turkish. A number of poets, of whom Seyyid Vehbī, Rāghib Pasha, Raḥmī of the Crimea, Kelīm and Sāmī are the most notable, took Nābī for their model. Of these, Sāmī is remarkable for the art with which he constructed his ghazels. Among the writers of this time who did not copy Nābī are Sābit, Rāsikh and Ṭālib, each of whom endeavoured, with no great success, to open up a new path for himself. We now reach the reign of Aḥmed III., during which flourished Nedīm, the greatest of all the poets of the old school. Little appears to be known about his life further than that he resided at Constantinople and was alive in the year 1727 (A.H. 1140). Nedīm stands quite alone: he copied no one, and no one has attempted to copy him. There is in his poetry a joyousness and sprightliness which at once distinguish it from the work of any other Turkish author. His ghazels, which are written with great elegance and finish, contain many graceful and original ideas, and the words he makes use of are always chosen with a view to harmony and cadence. His ḳasīdas are almost equal to his ghazels; for, while they rival those of Nef'ī in brilliancy, they surpass them in beauty of diction, and are not so artificial and dependent on fantastic and far-fetched conceits. The classical period comes to an end with Nedīm; its brightest time is that which falls between the rise of Nef'ī and the death of Nedīm, or, more roughly, that extending from the accession of Aḥmed I. 1603 (1012), to the deposition of Aḥmed III., 1730 (1143).

Classical Prose Writers.

We will now glance at the prose writers of this period. Under the name of *Humāyūn Nāma* (Imperial Book) 'Alī Chelebi made a highly esteemed translation of the well-known Persian classic *Anvār-i Suheylī*, dedicating it to Suleimān I. Sa'd-ud-Dīn (d. 1599), the preceptor of Murād III., wrote a valuable history of the empire from the earliest times to the death of Selīm I. This work, the *Tāj-ut-Tevārīkh* (Crown of Chronicles), is reckoned, on account of its ornate yet clear style, one of the masterpieces of the old school, and forms the first of an unbroken series of annals which are written, especially the later among them, with great minuteness and detail. Of Sa'd-ud-Dīn's successors in the office of imperial historiographer the most remarkable for literary power is Na'īmā. His work, which extends from 1591 (1000) to 1659 (1070), contrasts strongly with that of the earlier historian, being written with great directness and lucidity, combined with much vigour and picturesqueness. Evliyā, who died during the reign of Maḥommed IV., is noted for the record which he has left of his travels in different countries. About this time Ṭash-köprizāda began and 'Aṭā-ullāh continued a celebrated biography of the legists and sheikhs who had flourished under the Ottoman monarchs. Ḥājī Khalīfa, frequently termed Kātib Chelebi, was one of the most famous men of letters whom Turkey has produced. He died in 1658 (1068), having written a great number of learned works on history, biography, chronology, geography and other subjects. The Persianizing tendency of this school reached its highest point in the productions of Veysī, who left a *Life* of the Prophet, and of Nergisī, a miscellaneous writer of prose and verse. Such is the intentional obscurity in many of the compositions of these two authors that every sentence becomes a puzzle, over which even a scholarly Ottoman must pause before he can be sure he has found its true meaning. The first printing-press in Turkey was established by an Hungarian who had assumed the name of Ibrāhīm, and in 1728 (1141) appeared the first book printed in that country; it was Vanḳulī's Turkish translation of Jevherī's Arabic dictionary.

Coming now to the post-classical period, we find among poets worthy of mention Belīgh, Nevres, Ḥishmet and Sunbuli-zāda Vehbī, each of whom wrote in a style peculiar to himself. Three poets of note—Pertev, Neshet and Sheikh Ghālib—flourished under Selīm III. The last-named is the fourth great poet of the old school. *Ḥusn u ʿAshḳ* (Beauty and Love), as his great poem is called, is an allegorical romance full of tenderness and imaginative power. Ghālib's style is as original as that of Fuzūlī, Nefī or Nedīm. The most distinguished prose writers of this period are perhaps Rāshid, the imperial historiographer, ʿĀsim, who translated into Turkish two great lexicons, the Arabic *Ḳāmus* and the Persian *Burhān-i Ḳāṭiʿ*, and Kānī, the only humorous writer of merit belonging to the old school.

Post-classical Period.

When we reach the reign of Maḥmūd II., the great transition period of Ottoman history, during which the civilization of the West began to struggle in earnest with that of the East, we find the change which was coming over all things Turkish affecting literature along with the rest, and preparing the way for the appearance of the new school. The chief poets of the transition are Fāzil Bey, Wāṣif, notable for his not altogether unhappy attempt to write verses in the spoken language of the capital, ʿIzzet Molla, Pertev Pasha, ʿĀkif Pasha, and the poetesses Fitnet and Leylā. In the works of all of these, although we occasionally discern a hint of the new style, the old Persian manner is still supreme.

Transition Period.

More intimate relations with western Europe and a pretty general study of the French language and literature, together with the steady progress of the reforming tendency fairly started under Maḥmūd II., resulted in the birth of the new or modern school, whose objects are truth and simplicity. In the political writings of Reshīd and ʿĀkif Pashas we have the first clear note of change; but the man to whom more than to any other the new departure owes its success is Shināsī Effendi, who employed it (1859) for poetry as well as for prose. The European style, on its introduction, encountered the most violent opposition, but now it alone is used by living authors of repute. If any of these does write a pamphlet in the old manner, it is merely as a *tour de force*, or to prove to some faithful but clamorous partisan of the Persian style that it is not, as he supposes, lack of ability which causes the modern author to adopt the simpler and more natural fashion of the West. The whole tone, sentiment and form of Ottoman literature have been revolutionized by the new school: varieties of poetry hitherto unknown have been adopted from Europe; an altogether new branch of literature, the drama, has arisen; while the sciences are now treated and seriously studied after the system of the West. Among writers of this school who have won distinction are Ziyā Pasha, Jevdet Pasha, the statesman and historian, Ekrem Bey, the author of a beautiful series of miscellaneous poems, *Zemzema*, Ḥāmid Bey, who holds the first place among Ottoman dramatists, and Kemāl Bey (d. 1878), the leader of the modern school and one of the most illustrious men of letters whom his country has produced. He wrote with conspicuous success in almost every branch of literature—history, romance, ethics, poetry and the drama; and his influence on the Young Turk party of later days was profound. (For the Turkish language see TURKS.) (E. J. W. G.)

Modern School.

The *magnum opus* in English on Turkish poetry is E. J. W. Gibb's *History of Ottoman Poetry* (5 vols., 1900–8, vol. v. ed. E. G. Browne).

TURKEY, an abbreviation for Turkey-Cock or Turkey-Hen as the case may be, a well-known large domestic gallinaceous bird. How it came by this name has long been a matter of discussion, for it is certain that this valuable animal was introduced to Europe from the New World, and in its introduction had nothing to do with Turkey or with Turks, even in the old and extended sense in which that term was applied to all Mahommedans. But it is almost as unquestionable that the name was originally applied to the bird which we know as the guinea-fowl (*q.v.*), and there is no doubt that some authors in the 16th and 17th centuries curiously confounded these two species. As both birds became more common and better known, the distinction was gradually perceived, and the name "turkey" became restricted to that from the New World—possibly because of its repeated call-note—to be syllabled *turk, turk, turk*, whereby it may be almost said to have named itself (cf. *Notes and Queries*, 6th series, vol. iii. pp. 23, 369). But even Linnaeus could not clear himself of the confusion, and unhappily misapplied the name *Meleagris*, undeniably belonging to the guinea-fowl, as the generic term for what we now know as the turkey, adding thereto as its specific designation the word *gallopavo*, taken from the *Gallopava* of C. Gesner, who, though not wholly free from error, was less mistaken than some of his contemporaries and even successors.[1]

The turkey, so far as we know, was first described by Oviedo in his *Sumario de la natural historia de las Indias*[2] (cap. xxxvi.), said to have been published in 1527. He, not unnaturally, includes both curassows and turkeys in one category, calling both "Pavos" (peafowls); but he carefully distinguishes between them, pointing out among other things that the latter make a wheel (*hacen la rueda*) of their tail, though this was not so grand or so beautiful as that of the Spanish "Pavo," and he gives a faithful though short description of the turkey. The chief point of interest in his account is that he speaks of the species having been already taken from New Spain (Mexico) to the islands and to Castilla del Oro (Darien), where it bred in a domestic state among the Christians. Much labour has been given by various naturalists to ascertain the date of its introduction to Europe, to which we can at present only make an approximate attempt;[3] but after all that has been written it is plain that evidence concurs to show that the bird was established in Europe by 1530—a very short time to have elapsed since it became known to the Spaniards, which could hardly have been before 1518, when Mexico was discovered. The possibility that it had been brought to England by Cabot or some of his successors earlier in the century is not to be overlooked, and reasons will presently be assigned for supposing that one of the breeds of English turkeys may have had a northern origin;[4] but the often-quoted distich first given in Baker's *Chronicle* (p. 298), asserting that turkeys came into England in the same year—and that year by reputation 1524—as carps, pickerels and other commodities, is wholly untrustworthy, for we know that both these fishes lived in the country long before, if indeed they were not indigenous to it. The earliest documentary evidence of its existence in England is a "constitution" set forth by Cranmer in 1541, which Hearne first printed (Leland's *Collectanea*, 2nd ed., vol. vi. p. 38). This names "Turkey-cocke" as one of the "greater fowles" of which an ecclesiastic was to have "but one in a dishe," and its association with the crane and swan precludes the likelihood of any confusion with the guinea-fowl. Moreover the comparatively low price of the two turkeys and four turkey-chicks served at a feast of the serjeants-at-law in 1555 (Dugdale, *Origines*, p. 135) points to their having become by that time abundant, and indeed by 1573 Tusser bears witness to the part they had already begun to play in "Christmas husbandlie fare." In 1555 both sexes were characteristically figured by Belon (*Oyseaux*, p. 249), as was the cock by Gesner in the same year, and these are the earliest representations of the bird known to exist.

As a denizen of the poultry-yard there are at least two distinct breeds, though crosses between them are much commoner than purely-bred examples of either (see POULTRY). That known as the Norfolk breed is the smaller of the two, and is said to be the less hardy. Its plumage is black. The chicks also are black, with occasionally white patches on the head. The other breed, called the Cambridge, is much more variegated in colour, and some parts of the plumage have a bright metallic gloss, while the chicks are generally mottled with brownish grey. This has been much crossed with the American Bronze, the largest of all, which has the beautiful metallic plumage of the wild bird, with the

[1] The French *Coq* and *Poule d'Inde* (whence *Dindon*) involve no contradiction, looking to the general idea of what India then was. One of the earliest German names for the bird, *Kalekuttisch Hün* (whence the Scandinavian *Kalkon*), must have arisen through some mistake at present inexplicable; but this does not refer, as is generally supposed, to Calcutta, but to Calicut on the Malabar coast (cf. *Notes and Queries*, 6th series, vol. x. p. 185).

[2] Purchas (*Pilgrimes*, iii. 995) in 1625 quoted both from this and from the same author's *Hystoria general*, said to have been published a few years later.

[3] The bibliography of the turkey is so large that there is here no room to name the various works that might be cited. Recent research has failed to add anything of importance to what has been said on this point by Buffon (*Oiseaux*, ii. 132–162), Pennant (*Arctic Zoology*, pp. 291–300)—an admirable summary—and Broderip (*Zoological Recreations*, pp. 120–137)—not that all their statements can be wholly accepted. Barrington's essay (*Miscellanies*, pp. 127–151), to prove that the bird was known before the discovery of America and was transported thither, is an ingenious piece of special pleading which his friend Pennant did him the real kindness of ignoring.

[4] In 1672 Josselin (*New England's Rarities*, p. 9) speaks of the settlers bringing up "great store of the wild kind" of turkeys, "which remain about their houses as tame as ours in England." The bird was evidently plentiful down to the very seaboard of Massachusetts, and it is not likely to have been domesticated by the Indian tribes there, as, according to Hernandez, it seems to have been by the Mexicans. It was probably easy to take alive, and, as we know, capable of enduring the voyage to England.

Mexican form of which it quite agrees in colour. White, pied and buff turkeys are also often seen, and if care be taken they are commonly found to "breed true." Occasionally turkeys, the cocks especially, occur with a top-knot of feathers, and one of them was figured by Albin in 1738. It has been suggested with some appearance of probability that the Norfolk breed may be descended from the northern form, *Meleagris gallopavo* or *americana*, while the Cambridge breed may spring from the southern form, the *M. mexicana* of Gould (*Proc. Zool. Society*, 1856, p. 61), which indeed it very much resembles, especially in having its tail-coverts and quills tipped with white or light ochreous—points that recent North American ornithologists rely upon as distinctive of this form. If this supposition be true, there would be reason to believe in the double introduction of the bird into England at least, as already hinted, but positive information is almost wholly wanting.[1] The northern form of wild turkey, whose habits have been described in much detail by all the chief writers on North American birds, is now extinct in the settled parts of Canada and the eastern states of the Union, where it was once so numerous; and in Mexico the southern form, which would seem to have been never abundant since the conquest, has been for many years rare. Farther to the south, on the borders of Guatemala and British Honduras, there exists a perfectly distinct species, *M. ocellata*, whose plumage almost vies with that of a peacock in splendour, while the bare skin which covers the head is of a deep blue studded with orange caruncles (*Proc. Zool. Society*, 1861, pl. xl.).

The genus *Meleagris* is considered to enter into the family Phasianidae, in which it forms a subfamily Meleagrinae, peculiar to North and Central America. The fossil remains of three species have been described by Professor Marsh—one from the Miocene of Colorado, and two, one much taller and the other smaller than the existing species, from the post-Pliocene of New Jersey. Both the last had proportionally long and slender legs. (A. N.)

TURKI, strictly speaking an Arabic or Persian adjective formed from Turk, used by European writers in two rather different senses. (1) It is applied to tribes or languages which are Turkish as opposed to Aryan, Semitic, &c. (2) It is used as the special designation of the tribes and languages of Kashgaria and Eastern Turkestan. (See TURKS.)

TURKOMAN, a name applied to certain Turkish tribes still nomad or only recently settled in Transcaspia and northern Afghanistan and Persia. (See TURKS.)

TURKS AND CAICOS ISLANDS, a group in the British West Indies. They belong geographically to the Bahamas and lie between 21° and 22° N. and 71° and 72° 37′ W. They are of coral and sand formation, their combined area being 169 sq. m. The Turks Islands, taking their name from a species of cactus having the appearance of a turbaned head, are nine in number, but Grand Turk (10 sq. m.) and Salt Cay ($5\frac{1}{2}$ sq. m.) are the only two of any size. The town of Grand Turk, on the west of the island of that name, is the seat of government and a port of registry. Salt Cay has a good harbour.

The Caicos Islands lie to the north-west of Turks Islands and are seven in number. Cockburn Harbour on South Caicos, 22 m. from Grand Turk, is the principal settlement and a port of entry. The climate, though somewhat relaxing, is healthy, but there is a scarcity of drinking water, the average annual rainfall being only $27\frac{1}{2}$ in. The mean temperature is 82° F., but owing to the sea breezes the climate is never oppressive. Salt raking is the staple industry. Sisal hemp is grown, sponges are found in some quantities off the coast and there are four sponge-curing factories on the Caicos Islands. Pink pearls are occasionally found. The exports, chiefly to the United States, include salt, sponges and sisal hemp. Grand Turk is in cable communication with Bermuda and with Kingston, Jamaica, some 420 m. to the S.W.

The islands were uninhabited when, about 1678, the Bermudians began to visit them to rake the salt found in the ponds. These visits became annual and permanent settlements were made. In 1710 the British were expelled by the Spaniards, but they returned and the salt trade (largely with the American colonies) continued to be carried on by the Bermudians despite attacks by Spaniards and French, and counter-claims to the islands by the British authorities at the Bahamas, who about 1765 made good their claim. In 1799 the islands were given representation in the Bahamas Assembly, and they remained part of that colony until 1848, when on the petition of the inhabitants they were made a separate colony under the supervision of the governor of Jamaica. This arrangement proving financially burdensome the islands were in 1873 definitely annexed to Jamaica. They are governed by a commissioner assisted by a nominated legislative board. The census of 1901 showed a total population of 5287, of whom 342 were whites, the rest being negroes or mulattoes; 1751 of the inhabitants lived in Grand Turk Island.

See J. N. Bellin, *Description géographique des débouquements au nord de St Dominique* (1768); the *Jamaica Handbook* (London, yearly) and Sir C. P. Lucas, *Historical Geography of the British Colonies*, vol. ii. (2nd ed., Oxford, 1905).

TURKS. The words "Turk" and "Turkish" are used in three senses, political, linguistic and ethnological. Politically, Turk means a Mahommedan subject of the sultan of Turkey. In the East at any rate it is not employed in speaking of Christians, and its application to Arabs, Albanians, Kurds, &c., living in Turkey, though not unusual, is hardly correct. The linguistic use of the name, by which it designates a well-marked division of the Ural-Altaic languages and their speakers, is the most satisfactory. The languages in question are easily identified and defined (see below), and there can be little doubt that they were spoken by the vast majority of the people called Turks since the 6th century of the Christian era. Ethnographically, the use of the word presents difficulties, for it is not easy to differentiate the Turks by physique or customs from allied tribes such as the Finno-Ugrians, Mongolians and Manchus. The Bashkirs, who are probably of Finno-Ugrian stock, speak a Turkish language, and the Magyars, who speak a Ugrian language, have many Turkish characteristics. At the present day there is no difficulty in making a practical distinction between Turks and Mongols. The former speak Turkish languages, are Moslems by religion, live almost entirely in the western half of Asia and fall within the Arabic, and to some extent the European, sphere of influence; the latter speak Mongolian languages, are Buddhists by religion, live in the eastern half of Asia and fall within the sphere of Chinese influence. Yet both Turkish and Mongol traditions represent the two nations as descended from two brothers: Jenghiz Khan, the founder of the Mongol power, must have had large numbers of Turks in his armies, for the chief traces left in Europe of the Mongol invasions are the settlements of Turkish-speaking Tatars in Russia; and the name of his son, Jagatai, is commonly used for a Turkish dialect and khanate in the regions of the Oxus. In Central Asia the distinctions between tribes, nations and races are unusually fluid: we are dealing with predatory nomads for ever fighting with one another or with the settled populations round them. The conquerors enslaved the men and married the women of the conquered. a successful leader attracted round his standard men of different tribes and languages. The corps of janissaries instituted by the Turks in Europe is no doubt an illustration of what happened during many centuries in Asia. The Turks after taking Constantinople claimed from the Christian population a certain number of male children, who were brought up as Turkish soldiers with few ties or principles except obedience to their officers. There was thus a large class, of Turkish speech and Turkish habits, who had absolutely no Turkish blood in their veins. In addition to this, intermarriage has taken place to so large an extent that the modern Turks are almost entirely European in physique. Similarly, no doubt, among the hordes of Central Asia the youths of conquered tribes were absorbed and assimilated by the conquerors and lost their original language. Such transformations were facilitated by the fact that there was no great difference in the manners and customs of these tribes. They were all nomadic, mostly horsemen, and rapacious. As they settled down from time

[1] For results of a comparison of the skulls of wild and domesticated turkeys, see Dr Shufeldt, in *Journ. of Comp. Medicine and Surgery* (July 1887).

to time they borrowed a good deal from their more civilized neighbours, but their natural manner of life was simple and untrammelled. The Turkish-speaking tribes were apparently the most mobile and adventurous. Starting from the confines of China they reached India, Algeria and the walls of Vienna. They probably formed a large contingent in the hordes of Jenghiz and of the Huns, and perhaps the Petchenegs, Avars and Comans all belonged to this group. In comparison with them the Mongol and Manchu-speaking tribes, though conquerors in the East on no mean scale, seem stationary and inactive, while the Finno-Ugrians are nomad hunters rather than warriors. To the honour of the Turks it must be said that, bad as is their administration when judged by European standards and especially when applied to Europeans, the empires of the Seljuks, Osmanlis and Moguls which they founded rise far above the ordinary standard of ephemeral Oriental dynasties.

The effect of Turkish invasions has been in the main destructive, but they have also played a considerable part in transporting both ideas and commodities from one end of the old world to the other. The achievement by which they are best known—the transplantation of Mahommedanism on to European soil—is a remarkable, though not successful, feat of this kind. But they are also largely responsible for the introduction of Mahommedanism into India, for carrying Nestorian Christianity and Persian fire-worship into China, and for the overland intercourse between China and India which fostered if it did not introduce Chinese Buddhism. They exported Chinese silk to Byzantium, and the most ancient Buddhist temple in Japan contains Persian objects which must have been brought across Asia by their caravans.

Divisions.—At the present day the name Turk is applied primarily to the people who have conquered Constantinople and the regions known as Turkey, but the following may be classed as Turkish in the sense of belonging to the same group linguistically and to some extent racially:—

1. *The Yakuts* are a Siberian tribe who inhabit the country near the banks of the middle and lower Lena, including Yakutsk and Verkhoyansk on the Yana. Their language is purely Turkish, though differing considerably from the more western Turkish idioms, but they have largely intermingled with the Tunguses. They are said to be industrious and skilful alike as artisans, traders and agriculturists. They are nominal Christians, but preserve much of their old nature worship.

2. *Tatar* (*q.v.*) or *Tartar* is a popular name which in its most correct sense is applied to Turkish-speaking Moslems in Russia, who number over three millions and are mostly remnants of the Mongol invasion which took place in the 13th century. But it is also extended rather loosely to various tribes in Siberia and elsewhere who speak Mongolian, Finnish or other languages.

The following classes of Tatars speak Turkish languages: (*a*) The Kazan Tatars, numbering perhaps a million. Their centre is in the government of Kazan, but they extend down both banks of the Volga as far as the government of Saratov. (*b*) The Astrakhan Tatars, numbering only about 10,000. (*c*) The Bashkirs, whose headquarters are in the government of Ufa. They appear to be a tribe of Finnish origin who have adopted a Turkish language. (*d*) The Tatars of the Crimea, sometimes called the Krim or Nogai Tatars, who occupied the Crimea in the 13th century and had a considerable empire from the 15th to the 17th century. There are also Nogai Tatars in the Caucasus and Kuban country. (*e*) There are considerable bodies of Tatars in Rumania and Bulgaria, who appear to be Nogais who have emigrated from the Crimea, Bessarabia and other parts of Russia. (*f*) The Tatars of the Caucasus seem to be for the most part Azerbaijan Turks mingled with Armenian, Georgian, Lesghian and other blood. But the name is often loosely applied to any Mahommedan Caucasian tribe.

3. *Kirghiz* (*q.v.*), nomadic tribes amounting to about three million souls who are found chiefly in Asiatic Russia. They fall into two chief divisions. (*a*) The Kazaks, who inhabit the northern and eastern parts of the Aral-Caspian basin, including the government of Orenburg. They do not call themselves Kirghiz, and apparently the name has been given them by the Russians in order not to confuse them with the Cossacks. (*b*) The Kara-Kirghiz, who are the less numerous division, live in Dzungaria, in the Altai, about lakes Balkash and Issyk-kul, and extend southwards to the Pamirs and the sources of the Oxus. Some of them inhabit Chinese territory. Both divisions live chiefly on the produce of their herds. Their chief drink is *koumiss*, or fermented mare's milk.

4. *The Kara-Kalpaks* (*q.v.*) or Black-caps, who inhabit the south-eastern shores of the sea of Aral, are sometimes classed with the Kirghiz, but seem to be a separate branch of the Turki stock. They are a feeble race, apparently in process of extinction, and now number only about 50,000.

5. *Uzbeg* is a political and not an ethnological denomination. It is derived from Uzbeg Khan of the Golden Horde (1312–1340), and was subsequently used at the beginning of the 16th century to designate the adherents of Shaibani Khan. Finally it was employed as the name of the ruling tribes in the Central Asian khanates (much like Osmanli in Turkey), in opposition to Kirghiz and Sarts, as well as to non-Turkish tribes. The Uzbegs are accordingly a mixed race, but the elements of which they are composed are mostly Turkish. Their numbers have been estimated at about two millions. They are mostly agriculturists or dwellers in cities, not nomads.

6. *Sart* is the name commonly given to the Turkish-speaking urban population of the Central Asian khanates. It is opposed to Tajik, which denotes the agricultural, Iranian-speaking population, but both words are used very loosely and have come to mean little more than town and country people. Sart and Uzbeg are also opposed in the meanings of common people and aristocracy, but many Sarts claim Uzbeg descent. The word is hardly suitable for scientific use, but is employed by Russian writers as the name of the Turkish language spoken in Bokhara, Samarkand and Ferghana.

7. The various Turkish tribes found on the eastern slopes of the Tian Shan, in Kashgar, Yarkand, Khotan, &c., are the descendants of the ancient *Uighurs* or *Ouighours*. These people were probably the most eastern branch of the Turks who remained behind when the first westward movements were made, but subsequently moved westward themselves. They ruled in Kashgaria from the 10th to the 12th centuries, and, like other branches of the Turks, adopted Mahommedanism. They continued, however, to use a variety of the Syriac alphabet introduced by Nestorian missionaries, and a book, the *Kudatku Bilik*, composed in their language about 1065, is extant. The Taranchis, an agricultural tribe of the Ili basin, seem also to belong to this group. The Turkish spoken in Kashgaria, &c., is often distinguished as Turki.

8. *Mogul*, *Moghul* or *Mughal*, appears to be the same word as Mongol, but is commonly restricted to the tribes who invaded northern India from Ferghana in 1526 under Baber (or Babar) and established the Mahommedan Empire of Delhi. Memoirs written by Baber in Jagatai Turkish are extant.

9. The *Koibals* and *Karagasses* of the upper Yenisei are perhaps of Finnish stock, but they speak languages akin to the Kashgarian Turki. They are sometimes called Tatars.

10. *Turkoman* or *Turkman* is the name usually given to the nomadic tribes who inhabit the country between the Caspian and the Oxus. They appear to be a branch of the Western Turks and not essentially different from the Osmanlis or Azerbaijanis, except that until the Russian occupation of Merv they remained in the condition of predatory horse-riding nomads, much feared by their neighbours as "man-stealing Turks."

They are divided into many tribes, of which the principal are (*a*) The *Chaudors* in the north-western part of the Ust-Urt and near the Kara-boghaz Gulf. (*b*) The *Yomuts* or *Yamuds* extending from Khiva across the Ust-Urt and along the shore of the Caspian to Persia. (*c*) The *Goklans* or *Göklens* settled in the Persian province of Astarabad. They are said to be the most civilized and friendly of all the Turkomans. (*d*) The *Tekkes*, who were the most important tribe when the Russians conquered Transcaspia. They are first heard of in the peninsula of Mangishlak, but were driven out by the Kalmuks in 1718, and subsequently occupied the Akhal and Merv oases. The Russians inflicted a crushing defeat on them at Geok-Tepe in 1881. (*e*) The *Sakars* inhabit the left bank of the Oxus near Charjui. (*f*) The *Sariks* are found in the neighbourhood of Panjdeh and Yulatan. (*g*) The *Salors*, an old and important tribe, suffered much in the course of fights with the Tekkes and in 1857 migrated to Zarabad in Persian territory near the Hari-rud. (*h*) The *Ersaris* are now chiefly found near Khoja Salih. They were once a very important tribe on the upper Oxus. (*i*) The *Ali-elis* live near Andkhui.

11. The Turkish nomads scattered over Persian territory are often known by the name of *Azerbaijanis* or *Adharbaijanis*, though this name is strictly applicable only to the inhabitants of the province of Azerbaijan (*q.v.*), of which Tabriz is the capital. They are the descendants of various bodies of Turks who have wandered into Persia at various times, but more particularly of the Ghuzz tribes (the Οὖζοι of the Greeks) who invaded it during the Seljuk period. They are also known as Ilāt or Iliyāt, meaning tribes, and each tribe has its own chieftain or Ilkhani appointed by the shah.

Among the tribes are (1) The *Kajars*, who dwelt in Transcaucasia until Abbas the Great (1585–1628) forced a portion of them to settle near Astarabad. The present dynasty of Persian Shahs comes from this tribe. (2) The *Afshars* or *Awshars* are a very numerous tribe in the province of Azerbaijan. Another division of them is found in the Anti-taurus. (3) The *Shekakis* and *Shah-seven.* The latter is a political name which has become hereditary, "those who love the shah," *i.e.* partisans of the Safawî dynasty (1499–1736), and of the Shiite faith. (4) The *Karakoyunlu* living near the town of Khoi. In the south of Persia are found (5) the *Abulwerdis*, (6) the *Kara-Gözlü*, (7) the *Baharlu*, (8) the *Inamlu* and (9) the *Kashkai*. These last perhaps include the Khalaches or Khalaj who were already settled near Herat before the arrival of the Seljuks, and from whom sprang the Indian dynasty known as Khalji (1290–1320).

12. The Turks now inhabiting the Turkish Empire fall into various categories and have entered it at various times.

a. The *Osmanlis* or *Ottomans*. This word is loosely used to mean any Mahommedan subject of the sultan, though even then it is not generally extended to Arabs and Albanians. Used more strictly it means the clan of Osman and their descendants as opposed to Seljuks and other Turks. The name is genealogical rather than ethnic; for though the exploits of the Osmanlis have given them an importance in modern history far exceeding that of all the other tribes, they are not distinguished from them in language or customs. According to tradition the clan came from Khorasan, supported the Seljuks and received in return the fief of Eskishehr. In the 14th century they took Brusa from the Byzantine Empire and established a kingdom there which withstood the shock of Timur's invasion (1402). In 1453 they captured Constantinople. Until recently Turkish Mahommedans always employed the words Osmanli and Osmanlija to describe themselves and their language, and avoided the expressions Türk and Türkche as signifying semi-civilized tribes, but in the last twenty years the older words have again come into use as national designations.

b. There must be many Turks in the Ottoman dominions who have no claim to be called Osmanlis in the strict sense. Byzantine authors mention a colony of 30,000 Turks on the river Vardar in Macedonia as early as the 9th century, and many Turks in Europe are still called Koniots or Konariots and claim to be descendants of the Seljuks. After the defeat of the emperor Romanus at Manzikert (1071) Turkomans and Turks of every description poured into Asia Minor. The Tatars of the Dobrudja also seem to be an ancient settlement.

c. The *Kizil-Bash*, or red-heads, who are found in the plains of Asia Minor about Angora, Tokat and Karahissar, differ somewhat from the surrounding Turkish population in both physique and customs. They appear to be immigrants from Persian territory, where some of them still remain. They are industrious agriculturists and their women enjoy unusual freedom. They call themselves *Eski-Türk* or old Turks, and have a secret religion in which Shiite tenets seem to be combined with older pagan (or possibly Christian) elements.

d. In various parts of western and southern Asia Minor, particularly the plains of Cilicia, are nomadic Turkoman tribes called by the Turks *Yürük* or *Gyōchēbē*. They are even found near Smyrna. They are a peaceful race, with fair complexions and a fine physique, and are great camel breeders. Though they do not appear to have a religion of their own like the Kizil Bash, they are only nominally Mahommedans.

Besides the peoples mentioned above, a number of extinct tribes may have been Turkish-speaking, though in the absence of linguistic records no certain conclusion is possible. Such are the Huns, Ephthalites, Avars, Bulgars, Khazars, Comans and Petchenegs. The name Hun is perhaps identical with the Chinese Hiung-nu or with the Turkish word for ten, *on* or *un*, meaning the ten tribes. Of the Avars really nothing is known: they were an extremely barbarous people who made no settlements and disappeared as suddenly as they came. They have been identified with the Jwen-Jwen of the Chinese. The name of the Khazars has a Turkish sound: they were a relatively civilized people and had a kingdom in the neighbourhood of Astrakhan and the north Caspian which lasted for several centuries. The original Bulgarians were certainly not Slavs, though they acquired a Slavonic language, but it is more probable that they were Finno-Ugrians than Turks. The Petchenegs, also called Πατζινάκαι or Πατζινακῖται in Greek and Bisseni in Latin, are said to have been driven into Europe from the lower Ural by the Ghuzz (Οὖζοι) at the end of the 9th century, and wandered about the northern frontiers of the Byzantine Empire for about 300 years. Perhaps some of them settled in Hungary and Bulgaria. They were, like the Avars, very barbarous and were probably Turks, for Anna Comnena says they spoke the same language as the Comans. This dialect is known by the so-called Codex Cumanicus. Coman or Kuman is a name given by Europeans to the tribes who occupied Moldavia and the adjacent regions in the middle ages. Rubruquis speaks of the Coman Kipchaks, and it is probable that the Comans were a hybrid Turkish tribe.

History.—The invasions and conquests of the later Turkish dynasties form an important part of the history of the world and are treated in such articles as TURKEY; SELJUKS; TIMUR; MOGULS. Here it is proposed to sketch the earlier wanderings and agglomerations (for they can hardly be called kingdoms) of Turkish tribes in eastern and central Asia. Much new information on this subject has been made accessible in the last twenty years by the discovery near the river Orkhon, to the south of Lake Baikal, of Turkish inscriptions dating from the 8th century A.D., and by the publication of materials furnished by Chinese writers. But authorities are still not entirely agreed as to the chronology of the events recorded or the identity of the names which appear in Turkish, Greek and Chinese forms, so that the following summary is for many periods tentative.

From 1400 B.C. onwards, but especially about 200 B.C., Chinese history contains notices of warlike nomads called Hiung-nu or Hsiung-nu, who were a danger to the empire. Their political power broke up in the early centuries of this era before the advance of the Sien-pi and Tobas, who appear to have been Tunguses, and from whom arose the Wei dynasty of northern China. In A.D. 433 a Hiung-nu clan called Asena or A-shih-na, disliking the rule of the Wei, moved eastwards and sought the protection of a people called Jeu-Jen or Jwen-Jwen, who were also a kind of Hiung-nu. They are the Geougen of Gibbon and others, and their identity with the Avars has been affirmed and disputed with equal confidence. The Asena served the Jwen-Jwen as workers in iron and lived not far from the modern city of Shan-Tan in Kan-suh. In this neighbourhood was a hill called from its shape Türkü, Dürkü or T'u-chüeh, meaning helmet, and this is said be to the origin of the national name which has become so celebrated. The name Tu-Kiue (Tou-Kiue) or Turk is first used by the Chinese in recording the events of A.D. 545, and the following years, when the Turks, or descendants of the Asena, revolted against the Jwen-Jwen. These latter were crushed and disappear from history, at least under that name. The victorious Turks advanced across their territory, came into collision with the Hephthalites or Ephthalites, whom they defeated, and are heard of on the Oxus about A.D. 560. The period 546–582 marks the first brilliant epoch of early Turkish history. The tribes were not divided and made the most astonishing advance under Tumen (who took the title of Ili-Khan), his brother Itsämi or She-ti-mi (perhaps the Stembis of Greek writers), his son Mokan and Istämi's son Tardu or Ta-t'eu. Though fifty years before only a servile clan in China, they sent an embassy in 567 to the East Roman emperor Justin II., as related by Menander Protector (C. Müller: *Fragm. hist. graec.*, vol. iv.). The object of this mission was to open up commercial relations, especially in the silk trade, with the West, and to co-operate with the Greeks against the Persians, because the latter wished to make the Persian Gulf the only outlet for the silk trade, and with that object to hamper the communications of the Turks with Western powers. The ruler who sent this embassy is called in Greek

Silziboulos or Dilziboulos, corresponding to the Sinjibu of Arab chroniclers and perhaps representing Sin-jabgu in old Turkish, the latter part being a title. He has been identified with Istämi. Justin sent as envoy to him in return a certain Zemark, who visited the khan at Ektel or Ektag (? Ak-dagh), and several subsequent embassies were exchanged. In 598 the khan Tardu wrote to the emperor Maurice, and in 620–28 the Turks assisted Heraclius in his campaigns against Persia. Meanwhile the Turks had themselves split into two divisions with separate princes. A tendency towards division, very natural in so loose and extended a community, had been visible for some time, and the rupture was precipitated in 582 by the jealousy of Ta-lo-pien or Dalobian, who was angry at not being chosen khan. For a century and a half or so we hear of two khanates: the northern Turks, living near Lake Baikal and the southern tributaries of the Yenisei, and the western[1] Turks, who appear to have had two headquarters, one near Urumchi and one near Aulieata, north of Tashkent. But their conquests, or at least their successful raids, extended very much farther to the west and south. In 630 the Chinese pilgrim Yüan Chwang (Hsüan Tsang) was well received by their khan, T'ung-she-ho, who exercised some kind of authority from Turfan to Merv. The Chinese followed a consistent policy of spreading dissension among these dangerous tribes and of supporting the factions which were weak or distant against those who were strong or near. Accordingly they were friendly to the western Turks until they had conquered the northern Turks. This western branch lasted until about 750 as a political name. From about 550 till 650 they were independent, and, as mentioned, allies of the east Roman Empire against the Persians. But about 650 the politics of the Nearer East were transformed by the conquests of the Arabs following on the preaching of Mahomet. After subduing Persia in 639 they spread to Transoxiana. At the same time dissension prevailed among the western Turks themselves: the five tribes called Nu-she-pi, who lived west of Issyk-kul, quarrelled with the five tribes called Tu-lu living to the east of it. The Chinese fomented the quarrel, and in 659 were able to declare that they annexed the whole territory of the western Turks, including at least Dzungaria, Tashkent, Ferghana, Bokhara, Khulm, Badakshan, Ghazni, Bamian, Udyana, Wakhan and Karateghin. But it would seem that neither the Turkish occupation nor the Chinese annexation of most of these countries was effective. From 650 to 750 the possession of them was disputed not only by the Turks and Chinese but by the Tibetans in the east and the Arabs in the west. In the west, the campaigns of Qotaiba b. Moslim or Kutaiba (705–14) completed the Mahommedan conquest of Transoxiana (see CALIPHATE, sect. B § 6). In the east the really effective power seems to have been exercised by a new Turkish tribe called Turgäsh, who had capitals at Tokmak and in Ili.

For the history of the northern Turks our only authorities are the Orkhon inscriptions and Chinese writers. The half-century following on the division was prosperous for the northern as well as for the western Turks, and they menaced China; but in 630 the Chinese conquered them. This is the Chinese servitude mentioned in the inscriptions. In 682 Kutluk (also called Elteres, which seems to be a title) re-established a Turkish state on the Orkhon. He was succeeded by his brother Kapagan (or Me-Chuo), who subdued the Turgäsh, or perhaps merely drove them southwards, early in the 8th century, and was succeeded by Bilgä Kagan of the inscriptions.

This northern khanate was destroyed by a coalition of the Karluk, Uighur and Basmal in 744. These peoples, like the Turgäsh, appear to have been Turkish; for though Turk was originally the name of the clan whose destinies in its northern and western branches have just been sketched, yet there is no objection to the usage by which it is extended to the descendants of similar clans with similar customs and as far as is known similar languages. A succession of these pressed forwards from the east. When first heard of, the Karluk inhabited the country on the Irtysh and the Urungu, and subsequently occupied Teles and Tokmak. The Uighurs belonged to the group of tribes known as Tölös or T'ie-le and established themselves at Balasaghun (also known by the forms Kara-Balghasun, Kara-Balgassun and Balagasun: see KARAKORUM). This brings us to the middle of the 8th century. For the next two hundred years the Turkish element in Central Asia, though it must have been numerous, does not cut any figure in history, which is filled with the chronicles of Arab and Persian dynasties (see CALIPHATE; SAMANIDS), but in the 10th century we begin to hear of it again. Turkish adventurers founded the dynasty of Ghaznevids at Ghazni, and there was a Uighur kingdom in the east comprising Kashgar and Khotan. Boghra Khan, the ruler of this kingdom, was converted to Islam at the end of the 10th century, and it continued under various branches of Uighurs until 1120. An interesting memorial of this period is the book *Kudatku Bilik* (see below). More important politically is the rise of the Seljuks. They were the princely family of the Kabaks, who were a section of the group of tribes called Ghuzz (Oghuz, Οὖζοι), and are heard of in Transoxiana about 985. Their chieftains Toghrul and Chakir drove the Ghaznevids to India and established themselves as protectors of the Abbasid caliph, who formally ceded his temporal power to them. (For the history of the dynasty see SELJUKS.) Alp Arslan, the son of Chakir, defeated the Byzantines at Manzikert (1071), and prepared the way for the Ottoman conquests. His son Malik Shah ruled over nearly all the modern Turkey in Asia, and as far as the frontiers of China. On his death in 1092 his empire broke up into several pieces. Konia became the capital of the sultanate of Asia Minor and various Seljuk dynasties established themselves in Kerman, Irak and Syria. A new Turkish power was founded by the khans of Khiva, who are known as the Khwarizm-shahs. They were originally vassals of the Seljuks, with the title of tasdar or ewer-bearer, but became independent and conquered Khorasan and Irak. They had, however, to contend with yet another new arrival from the east, the Kara-Kitais. These also were probably Turks, and were pushed westwards from China by the Kins. They conquered Kashgar, Khotan, Yarkand and later Transoxiana, pushing the Ghuzz tribes before them into Persia and Afghanistan. Their prince bore the title of gur-khan, and the Khwarizm shahs did homage to him till 1208, when they unsuccessfully revolted. But all these squabbling principalities were swept away in 1219 by the extraordinary wave of invasion which surged across Asia to Europe under Jenghiz Khan (*q.v.*). After the death of Jenghiz his conquests were divided, and Transoxiana, Kashgar, Badakshan, Balkh and Ghazni were given to his second son Chagatai or Jagatai. Jenghiz and his family must have been Mongols, but the name Jagatai passed to the population and language of the countries about the Oxus. It does not appear that they ever ceased to be Turkish in speech and customs. The hordes of Jenghiz must have comprised a considerable Turkish element; the Mongols had no inclination to settle in cities, and Jagatai himself lived near Kulja in the extreme east of his dominions. Though the cities in western Central Asia suffered severely the people were not Mongolized, and Mahommedan learning even flourished. But otherwise the whole history of the Jagatai khanate, which lasted from 1234 to 1370, is a confused record of dissensions with frequent intervals of anarchy. In 1321 it split into two khanates, Transoxiana and Dzungaria, and in 1370 collapsed before Timur. This great conqueror (1333–1404), who like Jenghiz had an extraordinary power of collecting and leading the hordes of Central Asia, was a native of the district of Samarkand and a Turk by descent. He conquered successively Dzungaria (1370), Persia and the Caucasus (1390), the Kipchaks on the Volga (1395), and Northern India (1398). He then invaded Syria and Asia Minor, where he defeated but did not annihilate the Osmanlis. The house of Timur did not retain his more distant conquests, but they ruled at

[1] No better name seems forthcoming, but western Turks is a most inconvenient designation because it is also used (and equally correctly) to signify the Osmanlis and Seljuks as opposed to the Turks of Transoxiana and Kashgar.

Samarkand until 1499 with the usual struggles between different branches of the family. Their possessions included, at least from time to time, the northern parts of Afghanistan and Persia, as well as Transoxiana and Turkestan. They were one of the most enlightened and cultivated of Turkish dynasties. They beautified the cities of Central Asia and were patrons of literature. The literary languages were as a rule Arabic or Persian; Turkish was used more rarely and chiefly for poetry.

The Timurids were overthrown and succeeded by the Shaibani dynasty, a branch of the house of Juji, Jenghiz Khan's eldest son, to whom his father had assigned dominions in the region north of the kingdom of Jagatai. About 1465 a number of this clan migrated into the Jagatai khanate. They were given territory on the Chu River and were known as Uzbegs. About 1500 their chief, Mahommed Shaibani or Shahi Beg, made himself master of Transoxiana and founded the Uzbeg power. The chief opponent of the Uzbegs in their early days was Baber, who represented the house of Timur in the fifth generation, but he ultimately led his armies in another direction and invaded India (1526), where he founded the Mogul Empire, a far more important state than the principalities of the Oxus. The Shaibanis continued to rule in these latter till 1583, and were followed by the houses of Astrakhan and Mangit; but it is not necessary to continue here the complicated chronicles of these dynasties.

The Osmanlis, or house of Osman, the founders of the present Turkish Empire, appear to have been a clan similar to the early Seljuks or the present Turkomans of Transcaspia, who migrated into Asia Minor from Khorasan and made the neighbourhood of Brusa their headquarters. Their conspicuous position in history is mainly due to the fact that they attained pre-eminence very late and in districts very near Europe. Except for the invasion of Timur they did not suffer from the attacks of other Turks and they were able to concentrate their strength on the conquest of the decrepit Byzantine Empire.

Customs, Civilization, Religion, &c.—The Turks are imitative rather than original, and, in all their branches, have assimilated to some extent the nearest civilization whenever they have settled down. Up to the 7th century their only culture consisted of some scraps of Chinese and Indian civilization. Subsequently both the eastern and western states which they founded adopted Perso-Arabic civilization and Mahommedanism. The Osmanlis have also been affected by Byzantine and west European influences.

Chinese historians and the Turkish inscriptions of the Orkhon and Yenisei give us a good deal of information respecting the earlier condition of these tribes. We are told that the Hiung-nu lived on horseback and moved about from place to place in search of fresh pasture. They possessed horses, cattle and sheep and also camels. They had no towns or villages and no agriculture and they never stayed long in one camp, but during their halts a special piece of land was assigned to each tribe and each tent. They were ignorant of writing. The children were taught to ride and shoot, and the adults were expert archers. Their food was flesh and milk and their clothing the skins of animals. They were polygamous and a son married his deceased father's wives, except his own mother. It is expressly stated that old people were despised and neglected, but this barbarous trait disappeared from the manners of the later Turks.

Of the Turks in the 6th century the Chinese writers give a rather more flattering account. They had numerous grades of rank, and when their khan was invested with the supreme power he was carried in a carpet. When troops were levied or taxes collected, the required amount was carved on a piece of wood marked with a golden arrow as a sign of authority. Their punishments were severe. Marriage was by arrangement with the parents, not capture. The dead were kept for some time after death and the mourners gashed their faces. They sacrificed to heaven and to the spirits of their ancestors. Their amusements included singing antiphonally, playing dice and drinking *koumiss* till they were drunk. They had a written alphabet (derived from India or Syria) and a duodenary cycle in which the years were designated by the names of animals. Somewhat similar accounts are given of the Kerkur or Kirghiz and of the Kankli or Kankali. These were perhaps the ancestors of the Uighurs and moved about in carts with high wheels: they are described as a barbarous undisciplined people, but capable of concerted action.

In the Orkhon inscriptions of the early part of the 8th century a somewhat more civilized branch of the Turks gives an account of itself which tallies with the Chinese descriptions. No Turkish cities are mentioned, only tribes and localities. War is the national occupation. The sovereign or kagan fights himself, and it is interesting to see that the names of the various chargers which he mounted are carefully recorded. The spirit of tribal patriotism and desire for glory which animate these compositions are very noticeable and also the implied obligation of the rulers to see to the prosperity of the people. The existence of the tombs and of inscriptions in Chinese characters as well as in an alphabet of Aramaic origin, and the mention of gold, silver, silk and precious objects show that the builders had looted, so to speak, a certain amount of fragmentary civilization from their neighbours. The chief deity is Heaven or Tāngri (still used in Osmanli Turkish as the equivalent of Allah), who gives the kingdom to the kagans and cares for the name and reputation of the Turkish people. There are also spirits of the earth and waters. All this is very like the earliest Chinese religion. Funeral ceremonies were evidently elaborate and the cycle of years named after animals was used for chronology.

The Chinese pilgrim Hüsan Tsang was entertained by She-hu (perhaps a title), kagan of the Western Turks, near Tokmak about A.D. 630. He left an account of the barbaric splendour of his reception and alludes to the number of horses, the gold embroidery of the kagan's tent, the silk robes of his retinue, and the use of wine and music. He says the Turks were fire-worshippers and would not sit on wooden seats.

It is probable that before they were converted to Islam the Turks practised in a desultory manner Buddhism, fire-worship and Nestorian Christianity, though they never wholly accepted any of them. An interesting trace of Buddhism remains in the names Shaman and Shamanism. It would appear that the Indian word Śramana or Samana was applied to the wizards and exorcizers of the older Turkish superstition. Recent investigations have discovered the existence of a considerable Buddhist civilization at Khotan, but at the time when it flourished it would appear that the mass of the population was of Iranian affinities and that the Turkish element was small.

The *Kudatku Bilik* (about 1065) gives a picture of life in Eastern Turkestan after the conversion to Islam, but still showing many traces of Chinese influence. But after this period nearly all the Turks (except a few obscure tribes like the Yakuts) adopted the Perso-Arabic civilization. Some however, such as the Kirghiz, Turkomans and Yūrūks of Asia Minor, have not yet abandoned the nomadic life. The Turks seem to be everywhere characterized by their innate sense of discipline and their submissiveness to their own authorities; councils or assemblies have rarely assumed importance among them; sovereigns and even dynasties (except the house of Osman) have often been removed by violence, but the despotic form of government has never failed to secure obedience. But equally important, as explaining their military successes, is the fact, noticed alike by ancient Chinese historians and modern European officers, that the ordinary Turkish soldier has in military matters an unusual resourcefulness and power of initiative which, without impairing discipline, renders him independent of his officers.

Language.—The Turkish or Tatar-Turkish languages belong to the Ural-Altaic family. Both nominal and verbal forms are built up solely by the addition of suffixes, and the law of vowel harmony is strictly observed. Hard and soft vowels cannot occur in the same word, and there is a tendency to assimilate the vowels of the suffix to those of the root; thus *pederiniz*, your father, but *dostunuz*, your friend. From the Mongol-Manchu languages the Turkish group is distinguished by its much more developed system of inflexion, particularly in the verbs, by its free use of pronominal suffixes, and by its more thoroughly agglutinative character. The stem with its suffixes forms a single compound word, whereas in Mongol the suffixes often seem quasi-independent. In all these features Turkish resembles the Finno-Ugric languages, but it diverges from them in having a much simpler system of cases and different phonetics, in the absence of many peculiarities such as the incorporation of the pronominal object in the verb, and in the development of some special forms, such as the expression of negation by inserting a suffix after the verbal root (*yazdim*, I wrote, *yazmadim*, I did not write). The grammatical forms are more agglutinative and less inflexional than in Finnish; though they are single words, the root does not change and the elements can be easily separated, which is not always the case in Finnish. Compare the Turkish *györdünüz*, "you saw," from the root *györ*, with the equivalent Finnish *näitte* from *näke*. The fusion between the root and suffixes is much more thorough in the latter. Turkish thus stands midway between Mongol and Finnish in its development of the agglutinative principle. Also, though compounds are not unknown in Turkish (*e.g. demiryol*, railway) they are much rarer than in Finnish or Hungarian.

Despite the apparent divergence between Turkish and Mongol, due perhaps partly to the influence of Chinese on the latter, the affinity between them seems real, though not superficial. The pronouns, case suffixes, and construction of sentences all show a general similarity, and the verb in Buriat, which differs from other Mongol languages, exhibits a development parallel to Turkish.

The want of resemblance in vocabulary between the three classes of languages is remarkable. The numerals, for instance, in Turkish, Mongol and Finno-Ugric are entirely different, and considerable changes have to be assumed before the identity of words can be proved. A comparison of Turkish words with Mongol equivalents makes it probable that the former are in many instances contractions: thus *dagh*, mountain, *yol*, road, correspond to the Mongol *dabaga*, *yabudal* and perhaps represent an earlier *tavagh* and *yavol*. The best-known Turkish languages, particularly Osmanli, have borrowed an enormous number of Arabic and Persian words which disguise the characters of the native vocabulary and to some extent affect the grammar.

Compared with the Finno-Ugric group, the Turkish languages are remarkably uniform. Indeed, allowing for the lapse of time and the importation of foreign words, it is hardly an exaggeration to say that from the Lena to Constantinople, from the Orkhon inscriptions till now, we have merely one language in different dialects. The native vocabulary and grammar remain substantially the same. The linguistic type is evidently strongly individual and persistent, and its separation from Mongol, &c., is probably very ancient.

Radlov divides the Turkish languages or dialects into four groups, according to their phonetic system. (1) Eastern: Altai, Baraba, Lebed, Tuba, Abakan, Küärik, Soyon, Karagass and Uighur. (2) Western: Kirghiz, Bashkir, Irtysh and Volga dialects. (3) Central Asiatic: Jagatai, Taranji, &c. (4) Southern: Turkmani, Azerbaijani, Krimmi, Anadoli and Osmanli. But this classification does not seem entirely satisfactory. As one passes across Asia from the Yakuts, through Kashgar, Turkestan and Azerbaijan to Constantinople, the pronunciation of the Turkish languages becomes decidedly softer, the suffixes become more intimately united with the words to which they are appended (approaching though not attaining the unity of Finnish inflexions), and the verbal forms grow more numerous and more complicated. Thus in the east we find *nin*, *ni*, *ga* as suffixes for the genitive, accusative and dative, and *man* for that of the first personal pronoun (*e.g. durman*, I stand or I am) corresponding to *-in*, *-i*, *-a* and *-im* in Osmanli, which have clearly assumed the character of inseparable terminations more completely than the older forms. Osmanli possesses more copious verbal forms than the other dialects, some of which (such as the future in *-ajak*) seem to be recent formations. On the other hand, the dialects of Turkestan use in speaking, though not in writing, forms which indicate a process of composition followed by contraction, more remarkable than any change which has taken place in the west. For instance, *wopti*, a contraction of *bolup irdi*, is said to be currently used in Khokand for "has become." Yakut (which can still be best studied in Böhtlingk's excellent grammar of 1851) is the dialect which is most distinct from the others, but does not appear always to preserve the oldest forms. Thus it has lost the genitive, which is replaced by a pronominal periphrasis (*e.g. örüs bas-a*, horse head-his, *i.e.* horse's head), and has verbal forms like *bisabin*, I cut, *bispappin*, I do not cut, apparently standing for *bisarbin*, *bispatbin*. The negative suffix is *pa* not *ma*. The resemblance between the Turkish dialects is increased by the fact that they are nearly all written in a somewhat artificial and standardized form which imperfectly represents the variety existing in conversational speech.

Several alphabets have been employed to write Turkish. (1) Arabic characters are everywhere used by Mahommedan Turks, almost without exception; yet this alphabet is extremely ill suited to represent Turkish sounds. It cannot distinguish the hard and soft vowels, so that *oldu*, "he was" is written in the same way as *öldü*, "he died." In some cases the consonants indicate the character of the vowels which are to be supplied after them, hard consonants being followed by hard vowels and soft by soft. Thus the word spelt with the letters *kaf*, *re*, *he* is pronounced as *kara*, but that spelt with *kef*, *re*, *he* as *kerre*. Further the orthography often follows an antiquated pronunciation and the letters have many sounds. Thus the single letter *kef* can be used to express *k*, *ky*, *g*, *gy*, *y*, *v*, *w* and *n*. The result is that pure Turkish words written in Arabic letters are often hardly intelligible even to Turks and it is usual to employ Arabic synonyms as much as possible because there is no doubt as to how they should be read. Osmanli documents are often little more than a string of Arabic words with Turkish terminations.

2. The Uighurs and Eastern Turks used in the middle ages a short alphabet of fourteen letters derived from a Syriac source and probably introduced among them by Nestorian missionaries; similar characters may also have been employed by Manichaeans. The Mongol and Manchu alphabets represent further variations of this writing. Though very like the modern Nestorian, it is in some respects more nearly allied to the Estrangelo and Syro-Palestinian alphabets of the 6th and 7th centuries. The most important document in this alphabet is a MS. preserved at Vienna of the *Kudatku Bilik*, "The Blessed or Fortunate Knowledge," a poem composed at Kashgar about 1065. A colophon states that the MS. was written at Herat in 1465, and that it is a copy of one written in 1085. Inscriptions in a similar alphabet have also been found in China.

3. The most interesting forms of Turkish writing are those used on the inscriptions found in Siberia near the Yenisei and Orkhon rivers. For some time it has been known that stones bearing inscriptions as well as roughly carved figures and hunting scenes were to be found on the upper waters of the Yenisei, particularly near its tributary the Abakan in the district of Minusinsk. They are greatly venerated by the Soyotes inhabiting the region. They were first discovered by Messerschmidt in 1722, and some of them were represented in the plates of Strahlenberg's *Das nord. und östliche Theil von Europa und Asia* (1730). They were generally attributed to Scythians or Chudes. The knowledge of them did not much advance until the researches of Castrén (1847) and the Finnish Society of Archaeology, which in 1889 published the text of thirty-two, chiefly from the Uibat, Ulukem, Altynkul and Tes. Even more interesting are the monuments discovered in 1889 and known as the Orkhon or Kosho-Tsaidam inscriptions, as they were found in Mongolia to the south of Lake Baikal, between the river Orkhon and Lake Kosho-Tsaidam. The most important are a mortuary inscription in Turkish and Chinese, bearing a date corresponding to 733, in honour of Kül-tegin, and another recounting the exploits of Bilgä Kagan. A third inscription at Kara-Balgassun probably dates from 800–805. The inscriptions were deciphered and translated by Thomsen and Radlov, and Donner examined the origin of the alphabet. He came to the conclusion that the Yenisei alphabet is rather older than that of the Orkhon inscriptions, and that both are derived from the Aramaic alphabet and most nearly allied to the variety of it used on the coins of the Assacid dynasty. In the 3rd century A.D. a section of the Kirghiz, who subsequently moved northwards, were in West Sogdiana and in touch with the Yüe-Chi, who had been for some time in contact with Persia. The old Turkish characters bear a superficial resemblance to runes; the Yenisei letters have the simplest shapes, those of Kara-Balgassun the most complicated. But they are mostly traceable to Aramaic prototypes and have no connexion with Scandinavia. The vowels are generally omitted, even at the beginning of words, and, as in the modern Turkish method of using the Arabic alphabet, their quality is often indicated by the consonants, many of which have two forms, one used with soft the other with hard vowels. Thus *bar* and *bär* are differentiated not by the vowels but by the consonants employed to write them.

4. Turkish-speaking Armenians and Greeks often write it in their own alphabets. Turkish newspapers printed in Armenian characters are published in Constantinople, and Greek characters are similarly employed in several parts of Asia Minor.

TURLE, JAMES (1802–1882), English organist and composer, was born at Taunton, Somerset, and started as a choir boy at Wells Cathedral. In 1817 he became a pupil in London of the organist at Westminster Abbey, and after acting as deputy for some years he succeeded to this post himself in 1831 and held it till his death. He and Sir John Goss, the organist at St Paul's, had been fellow-pupils in London as boys. Turle was a great organist in his day, and composed a good deal of church music which is still well known. His son Henry Frederic Turle (1835–1883) was editor of *Notes and Queries*.

TURMERIC (from Fr. *terre mérite*, turmeric, Lat. *terra merita*, deserved, *i.e.* excellent earth; Skeat suggests that it is a barbarous corruption, perhaps of Arabic *karkam, kurkum*, saffron or curcuma), the tuberous root of *Curcuma longa*, L., an herbaceous perennial plant belonging to the natural order Zingiberaceae. It is a native of southern Asia, being cultivated on a large scale both on the mainland and in the islands of the Indian Ocean. Turmeric has been used from a remote period both as a condiment and as a dyestuff, and to a more limited extent as a medicine (now obsolete). In Europe it is employed chiefly as a dye, also as an ingredient in curry powder and as a chemical test for alkalies. The root is prepared by cleaning it and drying it in an oven. There are several varieties (Madras, Bengal, Gopalpur, Java, China and Cochin turmeric), differing chiefly in size and colour and to a slight degree in flavour. Some of these consist exclusively of the ovate central tubers, known as "bulbs," or "round turmeric," and others of the somewhat cylindrical lateral tubers, which are distinguished in trade as "fingers," or "long turmeric." Both are hard and tough, but break with a short resinous or waxy fracture, which varies in tint from an orange brown to a deep reddish brown. The colour is due to *curcumin*, $C_{14}H_{16}O_7$, of which the drug contains about 0·3%. When pure it forms yellow crystals having a vanilla odour and exhibiting a fine blue colour in reflected light. It is soluble in alcohol, in chloroform and in alkaline solutions, but only sparingly in water. Paper tinged with a tincture of turmeric exhibits on the addition of an alkali a reddish brown tint, which becomes violet on drying. This peculiarity was pointed out by H. A. Vogel in 1815, and since that date turmeric has been utilized as a chemical test for detecting alkalinity. It is of no therapeutic value. In Sierra Leone a kind of turmeric is obtained from a species of *Canna*.

TURNEBUS, ADRIANUS [Adrien Turnèbe] (1512–1565), French classical scholar, was born at Les Andelys in Normandy. At the age of twelve he was sent to Paris to study, and attracted great notice by his remarkable abilities. After having held the post of professor of belles-lettres in the university of Toulouse, in 1547 he returned to Paris as professor (or royal reader) of Greek at the Collège Royal. In 1552 he was entrusted with the printing of the Greek books at the royal press, in which he was assisted by his friend, Guillaume Morel (*q.v.*). He died of consumption on the 12th of June 1565. His works chiefly consist of philological dissertations, commentaries (on Aeschylus, Sophocles, Theophrastus, Philo and portions of Cicero), and translations of Greek authors into Latin and French. His son, Étienne, published his complete works, in three volumes (Strassburg, 1600), and his son Adrien his *Adversaria*, containing explanations and emendations of numerous passages in classical authors.

See *Oratio funebris* by Léger du Chesne (Leodegarius a Quercu) prefixed to the Strassburg edition; L. Clément, *De Adriani Turnebi praefationibus et poematis* (1899); J. E. Sandys, *History of Classical Scholarship* (1908) iii.

TURNER, CHARLES (1773–1857), English engraver, was born at Woodstock in 1773. He entered the schools of the Royal Academy in 1795; and, engraving in stipple in the manner of Bartolozzi, he was employed by Alderman Boydell. His finest plates, however, are in mezzotint, a method in which he engraved J.M.W. Turner's "Wreck" and twenty-four subjects of his *Liber studiorum*, Reynolds's "Marlborough Family," and many of Raeburn's best portraits, including those of Sir Walter Scott, Lord Newton, Dr Hamilton, Professors Dugald Stewart and John Robinson, and Dr Adam. He also worked after Lawrence, Shee and Owen. He was an admirable engraver, large, broad and masterly in touch; and he reproduced with great fidelity the characteristics of the various painters whose works he translated into black and white. In 1828 he was elected an associate of the Royal Academy. He died on the 1st of August 1857.

TURNER, SIR JAMES (1615–1686), Scottish soldier and military writer, was educated with a view to his entering the Church, but early showed his preference for the profession of arms by enlisting in the Swedish army, then the most famous training-school in Europe. He saw considerable service in the Thirty Years' War, and in 1640 returned to Scotland as a captain. It was not long before he secured employment, and as a major he accompanied the Scottish army in its invasion of England in the same year, successfully avoiding the imposition of the "Covenant" as a test. With Lord Sinclair's regiment Major Turner served in Ulster, and subsequently, after failing to join Montrose's army, accompanied the Scottish army until Naseby practically ended the Civil War. Turner was often with Charles I. during his detention at Leslie's headquarters, and continually urged him to escape. Up to this time he had served against the king, but always with some repugnance, and he welcomed the opportunity when in 1648 the cause of the king and the interests of the Scottish nation for the moment coincided. In the disastrous campaign which followed Turner was at Hamilton's headquarters, and it was owing to the neglect of his advice that the rout of Preston took place. Taken in the final surrender at Uttoxeter, he spent some time in captivity, but in 1649 was released and sent abroad. He was unable for want of means to reach Montrose in time to join in the final venture of the noblest of the Royalist commanders, but he landed in Scotland on the day before Dunbar, and in the grave crisis that followed was a welcome ally. As a colonel and adjutant-general of foot he was with Charles II. at Worcester. In that battle he was captured, but regained his liberty, and after many adventures escaped to the Continent, where for some years he was engaged in various Royalist intrigues, conspiracies and attempted insurrections. At the Restoration he was knighted, and in 1662 he became a major in the Royal Guards. Four years later, as a district commander in Scotland, he was called upon to deal severely with Covenanter disturbances. Though not, it appears, unjust, his dragooning methods eventually led to his being deprived of his command. The rest of his life was spent in retirement. A pension was granted to him by James II. in 1685. In 1683 he had published his *Pallas armata, Military Essayes of the Ancient Grecian, Roman and Modern Art of War*, one of the most valuable authorities for the history of military sciences.

TURNER, JOSEPH MALLORD WILLIAM (1775–1851), English painter, was born in London on the 23rd of April 1775. His father, William Turner, a native of Devonshire, kept a barber's shop at 26 Maiden Lane, in the parish of St Paul's, Covent Garden. Of the painter's mother, Mary Marshall or Turner, little is known; she is said to have been a person of ungovernable temper and towards the end of her life became insane. Apparently the home in which Turner spent his childhood was not a happy one, and this may account for much that was unsociable and eccentric in his character. The earliest known drawing by Turner, a view of Margate Church, dates from his ninth year. It was also about this time that he was sent to his first school at New Brentford. Of education, as the term is generally understood, he received but little. His father taught him to read, and this and a few months at New Brentford and afterwards at Margate were all the schooling he ever had; he never mastered his native tongue, nor was he able in after life to learn any foreign language. Notwithstanding this lack of scholarship, one of his strongest characteristics was a taste for associating his works with personages and places of legendary and historical interest, and certain stories of antiquity seem to have taken root in his mind very strongly.

By the time Turner had completed his thirteenth year his schooldays were over and his choice of an artist's career settled. In 1788–1789 he was receiving lessons from Palice, "a floral drawing master;" from T. Malton, a perspective draughtsman;

and from Hardwick, an architect. He also attended Paul Sandby's drawing school in St Martin's Lane. Part of his time was employed in making drawings at home, which he exhibited for sale in his father's shop window, two or three shillings being the usual price. He coloured prints for engravers, washed in backgrounds for architects, went out sketching with Girtin, and made drawings in the evenings for Dr Munro "for half a crown and his supper." When pitied in after life for the miscellaneous character of his early work, his reply was "Well! and what could be better practice?" In 1789 Turner became a student of the Royal Academy. He also worked for a short time in the house of Sir Joshua Reynolds, with the idea, apparently, of becoming a portrait painter; but, the death of Reynolds occurring shortly afterwards, this intention was abandoned. In 1790 Turner's name appears for the first time in the catalogue of the Royal Academy, the title of his solitary contribution being "View of the Archbishop's Palace, Lambeth." About 1792 he received a commission from Walker, the engraver, to make drawings for his *Copper-Plate Magazine*, and this topographical work took him to many interesting places. The natural vigour of his constitution enabled him to cover much of the ground on foot. He could walk from 20 to 25 m. a day with ease, his baggage at the end of a stick, making notes and memoranda as he went. He rose early, worked hard all day, wasted no time over his simple meals, and his homely way of living made him easily contented with such rude accommodation as he chanced to find on the road. A year or two after he accepted a similar commission to make drawings for the *Pocket Magazine*, and before his twentieth year he had travelled over many parts of England and Wales. None of these magazine drawings is remarkable for originality of treatment or for artistic feeling.

Up to this time Turner had worked in the back room above his father's shop. His love of secretiveness and solitude had already begun to show itself. An architect who often employed him to put in backgrounds to his drawings says, "he would never suffer me to see him draw, but concealed all that he did in his bedroom." On another occasion, a visitor entering unannounced, Turner instantly covered up his drawings, and, in reply to the intimation, "I've come to see the drawings for——," the answer was, "You shan't see 'em, and mind that next time you come through the shop, and not up the back way." Probably the increase in the number of his engagements induced Turner about this time to set up a studio for himself in Hand Court, not far from his father's shop, and there he continued to work till he was elected an associate of the Royal Academy (1799).

Until 1792 Turner's practice had been almost exclusively confined to water colours, and his early works show how much he was indebted to some of his contemporaries. There are few of any note whose style he did not copy or adopt. His first exhibited oil picture appeared in the Academy in 1793. In 1794–1795 Canterbury Cathedral, Malvern Abbey, Tintern Abbey, Lincoln and Peterborough Cathedrals, Shrewsbury, and King's College Chapel, Cambridge, were among the subjects exhibited, and during the next four years he contributed no less than thirty-nine works to the Academy. In the catalogue of 1798 he first began to add poetic quotations to the titles of his pictures; one of the very first of these—a passage from Milton's *Paradise Lost*—is in some respects curiously prophetic of one of the future characteristics of his art:—

> "Ye mists and exhalations that now rise
> From hill or steaming lake, dusky or grey
> Till the sun paints your fleecy-skirts with gold,
> In honour of the world's great author rise."

This and several other quotations in the following years show that Turner's mind was now occupied with something more than the merely topographical element of landscape, Milton's *Paradise Lost* and Thomson's *Seasons* being laid under frequent contribution for descriptions of sunrise, sunset, twilight or thunderstorm. Turner's first visit to Yorkshire took place in 1797. It seems to have braced his powers and possibly helped to change the student into the painter. Until then his work had shown very little of the artist in the higher sense of the term: he was little more than a painstaking and tolerably accurate topographer; but even under these conditions he had begun to attract the notice of his brother artists and of the critics. England was, at the time, at a low point both in literature and art. Among the artists De Loutherbourg and Morland were almost the only men of note left. Hogarth, Wilson, Gainsborough and Reynolds had passed away. Beechey, Bourgeois, Garvey, Farington—names well-nigh forgotten now—were the Academicians who painted landscape. The only formidable rivals Turner had to contend with were De Loutherbourg and Girtin, and after the death of the latter in 1802 he was left undisputed master of the field.

It is not, therefore, surprising that the exhibition of his works in 1798 was followed by his election to the associateship of the Royal Academy. That he should have attained to this position before completing his twenty-fourth year says much for the wisdom and discernment of that body, which further showed its recognition of his talent by electing him an Academician four years later. Turner owed much to the Academy. Ruskin says, "It taught him nothing." Possibly it had little to teach that he had not already been able to learn for himself; at all events it was quick to see his genius and to confer its honours, and Turner, naturally generous and grateful, never forgot this. He enjoyed the dignity of Academician for nearly half a century, and during nearly the whole of that period he took an active share in the direction of the Academy's affairs. His speeches are described as "confused, tedious, obscure, and extremely difficult to follow"; but at council meetings he was ever anxious to allay anger and bitter controversy. His opinions on art were always listened to with respect; but on matters of business it was often difficult to know what he meant. His friend Chantrey used to say, "He has great thoughts, if only he could express them." When appointed professor of perspective to the Royal Academy in 1808, this painful lack of expression stood greatly in the way of his usefulness. Ruskin says, "The zealous care with which Turner endeavoured to do his duty is proved by a series of large drawings, exquisitely tinted, and often completely coloured, all by his own hand, of the most difficult perspective subjects, illustrating not only directions of line, but effects of light, with a care and completion which would put the work of any ordinary teacher to utter shame." In teaching he would neither waste time nor spare it. With his election to the associateship of the Academy in 1799 Turner's early struggles may be considered to have ended. He had emancipated himself from hack work, had given up making topographical drawings of castles and abbeys for the engravers—drawings in which mere local fidelity was the principal object—and had taken to *composing* as he drew. Local facts had become of secondary importance compared with effects of light and colour. He had reached manhood, and with it he abandoned topographical fidelity and began to paint his dreams, the visionary faculty—the true foundation of his art—asserting itself, nature being used to supply suggestions and materials.

His pictures of 1797–1799 had shown that he was a painter of no ordinary power, one having much of the poet in him, and able to give expression to the mystery, beauty and inexhaustible fullness of nature. His work at this period is described by Ruskin as "stern in manner, reserved, quiet, grave in colour, forceful in hand."

Turner's visit to Yorkshire in 1797 was followed a year or two later by a second, and it was on this occasion that he made the acquaintance, which afterwards ripened into a long and staunch friendship, of Fawkes of Farnley Hall. From 1803 till 1820 Turner was a frequent visitor at Farnley. The large number of his drawings still preserved there—English, Swiss, German and Italian, the studies of rooms, outhouses, porches, gateways, of birds shot while he was there, and of old places in the neighbourhood—prove the frequency of his visits and his affection for the place and for its hospitable master. A caricature, made by Fawkes, and "thought by old friends to be very like," shows Turner as "a little Jewish-nosed man, in an ill-cut brown tail-coat, striped waistcoat, and enormous frilled shirt, with feet and hands notably small, sketching on a small piece of paper, held down almost level with his waist." It is evident from all the accounts given that Turner's personal appearance was not of a kind to command much attention or respect. This may have pained his sensitive nature, and led him to seek refuge in the solitude of his painting room. Had he been inclined he had abundant opportunity for social and friendly intercourse with his fellow men, but he gradually came to live more and more in a state of mental isolation. Turner could never make up his mind to visit Farnley again after his old friend's death, and his voice would falter when he spoke of the shores of the Wharfe.

Turner visited Scotland in 1800, and in 1801 or 1802 he made his first tour on the Continent. In the following year, of the seven pictures he exhibited, six were of foreign subjects, among them "Bonneville," "The Festival upon the Opening of the Vintage of Mâcon," and the well-known "Calais Pier" in the National Gallery. The last-named picture, although heavily painted and somewhat opaque in colour, is magnificently composed and full of energy.

In 1802, the year in which Turner became a Royal Academician, he took his father, who still carried on the barber business in Maiden Lane, to live with him. The old man lived in his son's house for nearly thirty years, making himself useful in various ways. It is said that he used to prepare and strain his son's canvases and varnish them when finished, which may explain a saying of Turner's that "his father used to begin and finish his pictures for him." He also attended to the gallery in Queen Anne Street, showed in visitors, and took care of the dinner, if he did not himself cook it. Turner was never the same man after his father's death in 1830, living a life of almost complete isolation.

In 1804 Turner made a second tour on the Continent, and in the following year painted the "Shipwreck" and "Fishing Boats in a Squall" (in the Ellesmere collection), seemingly in direct rivalry of Vandervelde, in 1806 the "Goddess of Discord in the Garden of the Hesperides" (in rivalry of Poussin), and in 1807 the "Sun rising through Vapour" (in rivalry of Claude).[1] The last two are notable works, especially the "Sun." In after years it was one of the works he left to the nation, on the special condition of its being hung beside the Claudes in the National Gallery. In this same year (1807) Turner commenced his most serious rivalry. Possibly it arose out of a desire to break down Claude worship—the then prevailing fashion—and to show the public that there was a living artist not unworthy of taking rank beside him. That the *Liber studiorum* was suggested by the *Liber veritatis* of Claude, and was intended as a direct challenge to that master, is beyond doubt. There is, however, a certain degree of unfairness to Claude in the way in which the challenge was given. Claude made drawings in brown of his pictures as they left the easel, not for publication, but merely to serve as private memoranda. Turner's *Liber* drawings had no such purpose, but were intended as a direct appeal to the public to judge between the two artists. The first of the *Liber* drawings was made in the autumn of 1806, the others at intervals till about 1815. They are of the same size as the plates and carefully finished in sepia. He left over fifty of these to the National Gallery. The issue of the *Liber* began in 1807 and continued at irregular intervals till 1819, when it stopped at the fourteenth number. Turner had resolved to manage the publishing business himself, but in this he was not very successful. He soon quarrelled with his engraver, F. C. Lewis, on the ground that he had raised his charges from five guineas a plate to eight. He then employed Charles Turner, who agreed to do fifty plates at the latter sum, but, after finishing twenty, he too wished to raise his price, and, as a matter of course, this led to another quarrel. Reynolds, Dunkarton, Lupton, Say, Dawe and other engravers were afterwards employed—Turner himself etching and mezzotinting some of the plates. Each part of the *Liber* contained five plates, the subjects, divided into "historical," "pastoral," "marine," &c., embracing the whole range of landscape art. Seventy-one plates in all were published (including one as a gift of the artist to his subscribers); ten other plates—more or less completed—intended for the fifteenth and sixteenth numbers were never published, the work being stopped for want of encouragement. Absence of method and business habits may account for this. Turner is said to have got up the numbers in his own house with the help of a female servant. The plates, which cost the subscribers only five shillings apiece, were so little esteemed that in the early quarter of the 19th century they were sometimes used for lighting fires. So much has fashion, or public taste, changed since then that a fine proof of a single plate has sold for £210. The merit of the plates is unequal; some—for example, "Solway Moss," "Inverary Pier," "Hind Head Hill," "Ben Arthur," "Rizpah," "Junction of the Severn and Wye" and "Peat Bog"—are of great beauty, while a few are comparatively tame and uninteresting. Among the unpublished plates "Stonehenge at Daybreak," "The Stork and Aqueduct," "The Via Mala," "Crowhurst," and "Moonlight off the Needles" take a high place. The *Liber* shows strong traces of the influence of Cozens and Girtin, and, as a matter of course, of Claude. In most of the designs the predominant feeling is serious; in not a few, gloomy, or even tragic. A good deal has been written about Turner's intention, and the "lessons" of the *Liber studiorum*. Probably his only intention in the beginning was to show what he could do, to display his art, to rival Claude, perhaps to educate public taste, and at the same time make money. If lessons were intended they might have been better conveyed by words. "Silent always with a bitter silence, disdaining to tell his meaning"—such is Ruskin's explanation; but surely Turner had little reason for either silence or contempt because the public failed to see in landscape art the means of teaching it great moral lessons. The plates of the *Liber* contain an almost complete epitome of Turner's art. It is supposed that his original intention had been that the *Liber* should consist of one hundred plates, and drawings for that number exist, but there was no public demand for them. Already in this work are seen strong indications of one of his most remarkable characteristics—a knowledge of the principles of structure in natural objects; mountains and rocks are drawn, not with topographical accuracy, but with what appears like an intuitive feeling for geological formation; and trees have also the same expression of life and growth in the drawing of stems and branches. This instinctive feeling in Turner for the principles of organic structure is treated of at considerable length in the fourth volume of *Modern Painters*, and Turner is there contrasted with Claude, Poussin, and some of the Dutch masters, greatly to their disadvantage.

After 1797 Turner was little concerned with mere topographical facts: his pictures might be like the places represented or not; much depended on the mental impression produced by the scene. He preferred to deal with the spirit, rather than with the local details of places. A curious example of the *reasonableness* accompanying his exercise of the imaginative faculty is to be found in his creations of creatures he had never seen, as, for example, the dragon[2] in the "Garden of the Hesperides" and the python in the "Apollo," exhibited in 1811. Both these monsters are imagined with such vividness and reality, and the sense of power and movement is so completely expressed, that the spectator never once thinks of them as otherwise than representations of actual facts in natural history. It needs but a little comparison to discover how far Turner surpassed all his contemporaries, as well as all who preceded him, in these respects. The imaginative faculty he possessed was of the highest order, and it was further aided by a memory of the most retentive

[1] This spirit of rivalry showed itself early in his career. He began by pitting himself against his contemporaries, and afterwards, when his powers were more fully developed, against some of the old masters, notably Vandervelde and Claude. During these years, while he kept up a constant rivalry with artists living and dead, he was continuing his study of nature, and, while seemingly a mere follower of the ancients, was accumulating that store of knowledge which in after years he was to use to such purpose.

[2] "The strange unity of vertebrated action and of a true bony contour, infinitely varied in every vertebra, with this glacial outline, together with the adoption of the head of the Ganges crocodile, the fish-eater, to show his sea descent (and this in the year 1806, when hardly a single fossil saurian skeleton existed within Turner's reach), renders the whole conception one of the most curious exertions of the imaginative intellect with which I am acquainted in the arts" (Ruskin, *Mod. Painters*, v. 313).

and unerring kind. A good illustration of this may be seen at Farnley Hall in a drawing of a "Man-of-War taking in Stores." Some one, who had never seen a first-rate, expressed a wish to know what it looked like. Turner took a blank sheet of paper one morning after breakfast, outlined the ship, and finished the drawing in three hours, young Fawkes, a son of the house, sitting beside him from the first stroke to the last. The size of this drawing is about 16 in. by 11 in. Ruskin thus describes it:—

"The hull of a first-rate occupies nearly one half of the picture to the right, her bows toward the spectator, seen in sharp perspective from stem to stern, with all her port-holes, guns, anchors and lower rigging elaborately detailed, two other ships of the line in the middle distance drawn with equal precision, a noble breezy sea, full of delicate drawing in its waves, a store ship beneath the hull of the larger vessel and several other boats, and a complicated cloudy sky, all drawn from memory, down to the smallest rope, in a drawing-room of a mansion in the middle of Yorkshire."

About the year 1811 Turner paid his first visit to Devonshire, the county to which his family belonged, and a curious glimpse of his simple manner of life is given by Redding, who accompanied him on some of his excursions. On one occasion they spent a night together in a small road-side inn, Turner having a great desire to see the country around at sunrise.

"Turner was content with bread and cheese and beer, tolerably good, for dinner and supper in one. In the little sanded room we conversed by the light of an attenuated candle and some aid from the moon until nearly midnight, when Turner laid his head upon the table and was soon fast asleep. Three or four hours' rest was thus obtained, and we went out as soon as the sun was up to explore the surrounding neighbourhood. It was in that early morning Turner made a sketch of the picture 'Crossing the Brook.'" In another excursion to Borough Island, "the morning was squally and the sea rolled boisterously into the Sound. Off Stakes Point it became stormy; our Dutch boat rode bravely over the furrows. Two of the party were ill. Turner was all the while quiet, watching the troubled scene. Bolt Head, to seaward, against which the waves broke with fury, seemed to absorb his entire notice, and he scarcely spoke a syllable. While the fish were getting ready Turner mounted nearly to the highest point of the island rock, and *seemed writing rather than drawing*. The wind was almost too violent for either purpose."

This and similar incidents show how careless of comfort Turner was, and how devoted to his art. The tumult and discomfort by which he was surrounded could not distract his powers of observation; and some thirty years later there is still evidence of the same kind. In the catalogue of the exhibition of 1842 one of his pictures bears the following title, "Snow-Storm: steam-boat off a harbour's mouth making signals in shallow water, and going by the lead. The author was in that storm the night the 'Ariel' left Harwich."

From 1813 till 1826, in addition to his Harley Street residence, Turner had a country house at Twickenham. He kept a boat on the river, also a pony and gig, in which he used to drive about the neighbouring country on sketching expeditions. The pony, for which Turner had a great love, appears in his well-known "Frosty Morning" in the National Gallery. He appears to have had a great affection for animals, and one instance of his tenderness of heart is given by one who often joined him in the amusement of fishing, of which Turner was very fond. "I was often with him when fishing at Petworth, and also on the banks of the Thames. His success as an angler was great, although with the worst tackle in the world. Every fish he caught he showed to me, and appealed to me to decide whether the size justified him to keep it for the table or to return it to the river; his hesitation was often almost touching, and he always gave the prisoner at the bar the benefit of the doubt."

In 1813 Turner commenced the series of drawings, forty in number, for Cooke's *Southern Coast*. This work was not completed till 1826. The price he at first received for these drawings was £7, 10s. each, afterwards raised to £13, 2s. 6d.

"Crossing the Brook" appeared in the Academy of 1815. It may be regarded as a typical example of Turner's art at this period, and marks the transition from his earlier style to that of his maturity. It represents a piece of Devonshire scenery, a view on the river Tamar. On the left is a group of tall pine-trees, beautifully designed and drawn with great skill and knowledge of structure; in the foreground a couple of children, with a dog carrying a bundle in its mouth across the brook; and beyond, a vast expanse of richly-wooded country, with glimpses of a winding river, an old bridge, a mill, and other buildings, and, in the far distance, the sea. Both in design and execution this work is founded upon Claude. Some critics consider it one of Turner's greatest works; but this is open to question.[1] It can hardly be called a work in full colour: it is limited to greys and quiet greens for the earth and pale blues for the sky. It is a sober but very admirable picture, full of diffused daylight, and in the painting of its distance better than any master who had preceded him. The fascination of the remote, afterwards so distinctive an element in Turner's pictures, shows itself here. Perhaps nothing tests the powers or tries the skill of the landscape painter more severely than the representation of distant effects. They come and go so rapidly, are often in a high key of light and colour, and so full of mystery and delicacy, that anything approaching to real imitation is impossible. Only the most retentive memory and the most sensitive and tender feeling will avail. These qualities Turner possessed to a remarkable degree, and as his powers matured there was an ever-increasing tendency in his art to desert the foreground, where things were definite and clear, in order to dream in the infinite suggestiveness and space of distances. "Dido Building Carthage" also belongs to this period. It hangs beside the Claudes in the National Gallery. It pertains to the old erroneous school of historical painting. Towering masses of Claudesque architecture piled up on either side, porticoes, vestibules, and stone pines, with the sun in a yellow sky, represent the Carthage of Turner's imagination. With all its faults it is still the finest work of the class he ever painted. Carthage and its fate had a strange fascination for him. It is said that he regarded it as a moral example to England in its agricultural decline, its increase of luxury, and its blindness to the insatiable ambition of a powerful rival. He returned again to this theme in 1817, when he exhibited his "Decline of the Carthaginian Empire: Hostages Leaving Carthage for Rome"—a picture which Ruskin describes as "little more than an accumulation of academy student's outlines coloured brown."

In 1818 Turner was in Scotland making drawings for the *Provincial Antiquities*, for which Sir Walter Scott supplied the letterpress, and in 1819 he visited Italy for the first time. One of the results of this visit was a great change in his style, and from this time his works became remarkable for their colour. Hitherto he had painted in browns, greys and blues, using red and yellow sparingly. He had gradually been advancing from the sober grey colouring of Vandervelde and Ruysdael to the mellow and richer tones of Claude. His works now begin to show a heightened scale of colour, gradually increasing in richness and splendour and reaching its culminating point in such works as the "Ulysses," "Childe Harold's Pilgrimage," "The Golden Bough," and "The Fighting Téméraire." All these works belong to the middle period of Turner's art (1829–1839), when his powers were entirely developed and entirely unabated. Much of his most beautiful work at this period is to be found in his water-colour drawings: those executed for Whitaker's *History of Richmondshire* (1819–1821), for Cooke's *Southern Coast* (1814–1826), for *The Rivers of England* (1824), for *England and Wales* (1829–1838), *Provincial Antiquities* (1826), Rogers's *Italy* (1830), Scott's *Works* (1834), and *The Rivers of France* (1833–1835) are in many instances of the greatest beauty. Of the Richmondshire drawings Ruskin says, "The foliage is rich and marvellous in composition, the rock and hill drawing insuperable, the skies exquisite in complex form."

But perhaps one of the greatest services Turner rendered to the art of England was the education of a whole school of

[1] "Crossing the Brook" was a great favourite with Turner. It was painted for a patron, who, dissatisfied with it, left it on the painter's hands. The price asked (£500) seems to have been part of the objection. Turner subsequently refused an offer of £1600 for it.

engravers. His best qualities as a teacher came from the union of strength and delicacy in his work; subtle and delicate tonality was almost a new element for the engraver to deal with, but with Turner's teaching and careful supervision his engravers by degrees mastered it more or less successfully, and something like a new development of the art of engraving was the result. No better proof can be found of the immense advance made than by comparing the work of the landscape engravers of the pre-Turnerian period with the work of Miller, Goodall, Willmore, Cooke, Wallis, Lupton, C. Turner, Brandard, Cousen, and others who worked under his guidance. The art of steel engraving reached its highest development in England at this time. Rogers's *Italy* (1830) and his *Poems* (1834) contain perhaps the most beautiful and delicate of the many engravings executed after Turner's drawings. They are vignettes,[1] a form of art which Turner understood better than any artist ever did before—perhaps, we might add, since. "The Alps at Daybreak," "Columbus Discovering Land," and "Datur Hora Quieti" may be given as examples of the finest.

In 1828 Turner paid a second visit to Italy, this time of considerable duration, on the way visiting Nîmes, Avignon, Marseilles, Genoa, Spezzia and Siena, and in the following year he exhibited the "Ulysses Deriding Polyphemus," now in the National Gallery. It marks the beginning of the central and best period of Turner's power. This work is so well known that description is hardly needed. The galley of Ulysses occupies the centre of the picture; the oars are being thrust out and the sailors flocking up the masts to unfurl sail, while Ulysses waves the blazing olive tree in defiance of the giant, whose huge form is seen high on the cliffs above; and the shadowy horses of Phoebus are traced in the slanting rays of the rising sun. The impression this picture leaves is one of great power and splendour. The painting throughout is magnificent, especially in the sky. Leslie speaks of it as "a poem of matchless splendour and beauty." From this period onward till about 1840 Turner's life was one of unceasing activity. Nothing is more astonishing than his prodigious fertility; he rose early, worked from morning till night, entirely absorbed in his art, and gradually became more and more solitary and isolated. Between 1829 and 1839 he sent fifty-five pictures to the Royal Academy, painted many others on private commission, made over four hundred drawings for engravers, besides thousands of studies and sketches from nature. His industry accounts for the immense quantity of work he left behind him. There is not the slightest evidence to show that it arose from a desire to make money, which he never cared for in comparison with his art. He has been accused, perhaps not without some cause, of avarice and meanness in his business dealings, and many stories are told to his discredit. But in private he often did generous things, although owing to his reserved disposition his virtues were known only to a few. His faults on the other hand—thanks to the malice, or jealousy, of one or two individuals—were freely talked about and, as a matter of course, greatly exaggerated. "Keep it, and send your children to school and to church," were the words with which he declined repayment of a considerable loan to a poor drawing-master's widow. On another occasion, when interrupted in his work, he roughly chid and dismissed the applicant, a poor woman; but she had hardly left his door before he followed her and slipped a £5 note into her hand. His tenants in Harley Street were in arrears for years, but he would never allow his lawyer to distrain; and if further proof of his generosity were needed his great scheme for bettering the condition of the unfortunate in his own profession should suffice. On one occasion he is known to have taken down a picture of his own from the walls of the Academy to make room for that of an unknown artist.

[1] "Of all the artists who ever lived I think it is Turner who treated the vignette most exquisitely, and, if it were necessary to find some particular reason for this, I should say that it may have been because there was nothing harsh or rigid in his genius, that forms and colours melted into each other tenderly in his dream-world, and that his sense of gradation was the most delicate ever possessed by man" (Hamerton).

The first of Turner's Venetian pictures ("Bridge of Sighs, Ducal Palace and Custom House, Venice, Canaletti Painting") appeared in the Academy in 1833. Compared with the sober, prosaic work of Canaletti, Turner's pictures of Venice appear like poetic dreams. Splendour of colour and carelessness of form generally characterize them. Venice appeared to him "a city of rose and white, rising out of an emerald sea against a sky of sapphire blue." Many of these Venetian pictures belong to his later manner, and some of them, "The State Procession bearing Giovanni Bellini's Pictures to the Church of the Redeemer" (exhibited in the Royal Academy, 1841), "The Sun of Venice Going to Sea" (1843), "Approach to Venice" (1844), and "Venice, Evening, Going to the Ball" (1845), to his latest. As Turner grew older his love of brilliant colour and light became more and more a characteristic. In trying to obtain these qualities he gradually fell into an unsound method of work, treating oil as if it had been water-colour, using both indiscriminately on the same canvas, utterly regardless of the result. Many of his finest pictures are already in a ruined state, mere wrecks of what they once were.

"The Fighting Téméraire Tugged to her Last Berth to be Broken Up" was exhibited in the Academy of 1839. By many it is considered one of his finest works. Turner had all his life been half a sailor at heart: he loved the sea, and shipping, and sailors and their ways; many of his best pictures are sea pieces; and the old ships of Collingwood and Nelson were dear to him. Hence the pathetic feeling he throws around "The Fighting Téméraire." The old three-decker, looking ghostly and wan in the evening light, is slowly towed along by a black, fiery little steam tug—a contrast suggesting the passing away of the old order of things and the advent of the new; and behind the sun sets red in a thick bank of smoke or mist. "The Slave Ship," another important sea picture, was exhibited in the following year, and in 1842 "Peace: Burial at Sea," commemorative of Wilkie.

Turner had now reached his sixty-seventh year, but no very marked traces of declining power are to be seen in his work. Many of the water-colour drawings belonging to this period are of great beauty, and, although a year or two later his other powers began to fail, his faculty for colour remained unimpaired almost to the end. He paid his last visit to the Continent in 1843, wandering about from one place to another, and avoiding his own countrymen, an old and solitary man. At his house in Queen Anne Street they were often ignorant of his whereabouts for months, as he seldom took the trouble to write to any one. Two years later (1845) his health gave way and with it both mind and sight began to fail. The works of his declining period exercised the wit of the critics. Turner felt these attacks keenly. He was naturally kind-hearted and acutely sensitive to censure. "A man may be weak in his age," he once remarked, "but you should not tell him so."

After 1845 all the pictures shown by Turner belong to the period of decay—mere ghosts and shadows of what once had been. In 1850 he exhibited for the last time. He had given up attending the meetings of the Academicians; none of his friends had seen him for months; and even his old housekeeper had no idea of his whereabouts. Turner's mind had evidently given way for some time, and with that love of secrecy which in later years had grown into a passion he had gone away to hide himself in a corner of London. He had settled as a lodger in a small house in Chelsea, overlooking the river, kept by his old Margate landlady, Mrs Booth. To the children in the neighbourhood he was known as "Admiral Booth." His short, sailor-like figure may account for the idea that he was an impoverished old naval officer. He had been ill for some weeks, and when his Queen Anne Street housekeeper at last discovered his hiding-place she found him sinking, and on the following day, the 19th of December 1851, he died. He was buried in St Paul's Cathedral, in deference to a wish he had himself expressed. He left the large fortune he had amassed (about £140,000) to found a charity for the "maintenance and support of male decayed artists, being born in England, and of English parents only, and of lawful issue." His pictures he bequeathed to the nation, on condition that they were exhibited in rooms of their own, and that these rooms were to be called "Turner's Gallery." The will and its codicils were so confused that after years of litigation, during which a large part of the money was wasted in legal expenses, it was found impossible to decide what Turner really wanted. A compromise was effected in which the wishes of everybody, save those of the testator, were consulted, his next-of-kin, whom he did not mean to get a single farthing, inheriting the bulk of his property. The nation got all the pictures and drawings, and the Royal Academy £20,000.

If Turner had died early his reputation as an artist would have been very different from what it ultimately became. He would not have been recognized as a colourist. It was only after the year 1820 that colour began to assert itself strongly in his work. He painted for many a year in greys and greens and browns, went steadily through "the subdued golden chord," and painted yellow mists and suns rising through vapour; but as time went on that was no longer enough, and he tried to paint the sun in his strength and the full glories of sunshine. The means at the painter's disposal are, however, limited, and Turner, in his efforts after brilliancy, began to indulge in reckless experiments in colour. He could not endure even the slightest restraints which technical limitations impose, but went on trying to paint the unpaintable. As a water-colour painter Turner stands pre-eminent; he is unquestionably the greatest master in that branch of art that ever lived. If his work is compared with that of Barrett, or Varley, or Cozens, or Sandby, or any of the earlier masters, so great is Turner's superiority that the art in his hands seems to be lifted altogether into a higher region.

In 1843 a champion, in the person of John Ruskin, arose to defend Turner against the unjust and ignorant attacks of the press, and what at first was intended as a "short pamphlet, reprobating the manner and style of these critics," grew into the five volumes of *Modern Painters*. Ruskin employed all his eloquence and his great critical faculty to prove how immeasurably superior Turner was to all who had ever gone before, hardly restricting his supremacy to landscape art, and placing him among the "seven supreme colourists of the world."

Like most men of note, Turner had his enemies and detractors, and it is to be regretted that so many of the stories they set in circulation against his moral character should have been repeated by one of his biographers, who candidly admits having "spared none of his faults," and excuses himself for so doing by "what he hopes" is his "undeviating love of truth." The immense quantity of work accomplished by Turner during his lifetime, work full of the utmost delicacy and refinement, proves the singularly fine condition of his nervous system, and is perhaps the best answer that can be given to the charge of being excessively addicted to sensual gratification. In his declining years he possibly had recourse to stimulants to help his failing powers, but it by no means follows that he went habitually to excess in their use. He never lost an opportunity of doing a kindness, and under a rough and cold exterior there was more good and worth hidden than the world imagined. "During the ten years I knew him," says Ruskin, "years in which he was suffering most from the evil-speaking of the world, I never heard him say one depreciating word of any living man or man's work; I never saw him look an unkind or blameful look; I never knew him let pass, without sorrowful remonstrance, or endeavour at mitigation, a blameful word spoken by another. Of no man, but Turner, whom I have ever known could I say this." Twice during his earlier days there are circumstances leading to the belief that he had the hope of marriage, but on both occasions it ended in disappointment, and his home after his father died was cheerless and solitary.

Two biographies of Turner have been written, one by Thornbury, the other by P. G. Hamerton. The work of the latter deserves the highest commendation; it gives a clear and consistent history of the great artist, and is characterized by refined thought and critical insight. An excellent little book by W. Cosmo Monkhouse may also be noticed. Books upon Turner continue to appear, although it is scarcely to be expected that they can add to the facts already known about him. *Turner and Ruskin*, an exposition of the work of Turner from the writings of Ruskin, edited with a biographical note on Turner by Frederick Wedmore, in two volumes, with ninety-one illustrations, was published by George Allen in 1900. Perhaps the most important recent work upon his art is Sir Walter Armstrong's *Turner* (1901), which deals at considerable length with the events of his life, and with his pictures in oil and his drawings in water-colour. It also gives so far as possible a list of his oil pictures, and for the first time a pretty full list of his water colours, although the great painter's works in both media are so numerous that it would be impossible to say that either is complete. See also *J. M. W. Turner*, by W. L. Wyllie, A.R.A. (1905). The great authority on the *Liber Studiorum* is W. G. Rawlinson (Turner's *Liber Studiorum*, 2nd ed., 1906). (G. Re.)

TURNER, NAT (1800–1831), the negro leader of a slave insurrection in Virginia, known as the "Southampton Insurrection," was born in Southampton county, Virginia, in 1800. From his childhood he claimed to see visions and hear voices, and he became a Baptist preacher of great influence among the negroes. In 1828 he confided to a few companions that a voice from heaven had announced that "the last shall be first," which was interpreted to mean that the slaves should control. An insurrection was planned, and a solar eclipse in February 1831 and peculiar atmospheric conditions on the 13th of August were accepted as the signal for beginning the work. On the night of the 21st of August 1831, with seven companions, he entered the home of his master, Joseph Travis, and murdered the inmates. After securing guns, horses and liquor they visited other houses, sparing no one. Recruits were added, in some cases by compulsion, until the band numbered about sixty. About noon on the 22nd they were scattered by a small force of whites, hastily gathered. Troops, marines and militia were hurried to the scene, and the negroes were hunted down. In all thirteen men, eighteen women, and twenty-four children had been butchered. After hiding for several weeks Nat was captured on the 30th of October and was tried and hanged, having made, meanwhile, a full confession. Nineteen of his associates were hanged and twelve were sent out of the state. The insurrection, which was attributed to the teachings of the abolitionists, led to the enactment of stricter slave codes.

See S. B. Weeks, "Slave Insurrections in Virginia," in *Magazine of American History*, vol. xxxi. (New York, 1891), and W. S. Drewry, *The Southampton Insurrection* (Washington, 1900).

TURNER, SHARON (1768–1847), English historian, was born in Pentonville, London, on the 24th of September 1768. His parents came from Yorkshire. He was educated at a private school kept by Dr Davis in Pentonville, and was articled to a solicitor in the Temple in 1783, and when his master died in 1789 he continued the business. He remained in business at first in the Temple, and later in Red Lion Square till 1829, when failing health compelled him to retire. He settled for a time at Winchmore Hill, but afterwards returned to London, and died in his son's house on the 13th of February 1847. In early boyhood he had been attracted by a translation of the "Death Song of Ragnar Lodbrok," and was led by this boyish interest to make a study of early English history in Anglo-Saxon and Icelandic sources. He devoted all the time he could spare from his business to the study of Anglo-Saxon documents in the British Museum. The material was abundant and had hitherto been neglected. When the first volume of his *History of England from the earliest times to the Norman Conquest* appeared in 1799, it was at once recognized as a work of equal novelty and value. The fourth volume appeared in 1805. He also published a continuation (*History of England during the Middle Ages*), a *Modern History of England*, a *Sacred History of the World*, and a volume on *Richard III.* (1845), and he was the author of pamphlets on the copyright laws (1813).

His son, Sydney Turner (1814–1879), educated at Trinity College, Cambridge, took orders, was known as a strong partisan of reformatory schools, and died rector of Hempstead in Gloucestershire.

TURNER, WILLIAM (d. 1568), English divine, botanist and physician, was born at Morpeth in Northumberland, and was educated at Pembroke Hall, Cambridge, where he was elected junior fellow in 1530. He learnt Greek from Nicholas Ridley, and, hearing Hugh Latimer preach, threw in his lot with the new faith. In 1538 he published his *Libellus de re herbaria*, and in 1540 set out to preach in different places. For doing this without a licence he suffered imprisonment, and on his release travelled in Holland, Germany, Italy and Switzerland, always increasing his knowledge of botany and medicine, collecting plants, and writing books on religion which were so popular in England that they were forbidden by proclamation in July 1546. On the accession of Edward VI. he became chaplain and physician to the duke of Somerset and in 1550 prebendary of York. In November 1550 he was made dean of Wells, but in 1553 was deprived, and during Queen Mary's reign lived at various places in Germany, mostly along the Rhine. Returning to England in 1558 he regained his deanery, and did all he could to disparage episcopacy and ceremonial, and to bring the Anglican Church into conformity with the Reformed Churches of Germany and Switzerland. On the complaint of his bishop, Gilbert Berkeley, he was suspended for Nonconformity in 1564. He passed his last days in Crutched Friars, London, and died on the 7th of July 1568. Turner was a sound and keen botanist, and introduced lucerne into England. He was a racy writer, a man of undoubted learning, and a vigorous controversialist.

TURNHOUT, a town of Belgium, in the province of Antwerp, 26 m. N.E. of that city. Pop. (1904), 22,162. It carries on an active industry in cloth and other manufactures. There is a breeding establishment for leeches. The hôtel de ville was formerly a palace of the dukes of Brabant. Two miles west of Turnhout is the curious penal or reformatory colony of Merxplas (pop. in 1904, 2827). The system of this establishment is to allow certain approved prisoners to follow their usual occupations within a defined area. The persons detained have complete liberty of movement, subject to the two conditions that they are under the supervision of guardians and are not allowed to cross the boundaries of the settlement. They also wear a distinct dress, and each prisoner bears a number.

TURNIP, *Brassica campestris*, var. *Rapa*, a hardy biennial, found in cornfields in various parts of England. It has been cultivated from a remote period for its fleshy roots. The tender growing tops are also used in spring as a green vegetable. The so-called "root" is formed by the thickening of the primary root of the seedling together with the base of the young stem (hypocotyl) immediately above it. The great mass of the "root" consists of soft "wood" developed internally by the cambium layer and composed mainly of thin-walled, unlignified, wood-parenchyma. The stem remains short during the first year, the leaves forming a rosette-like bunch at the top of the "bulb"; they are grass-green and bear rough hairs. In the second season the bud in the centre of the rosette forms a strong erect branched stem bearing somewhat glaucous smooth leaves. The stem and branches end in corymbose racemes of small, bright yellow flowers, which are succeeded by smooth, elongated, short-beaked pods.

The varieties of turnip are classified according to their shape as (1) long varieties, with a root three or more times as long as broad; (2) tankard or spindle-shaped varieties, with a root about twice as long as broad; (3) round or globe varieties with an almost spherical root; (4) flat varieties with a root broader than long; there are also many intermediate forms. Turnips are also grouped according to the colour of the upper part of the root which comes above ground, and according to the colour of the flesh, which is white or yellow. The yellow-fleshed varieties, many of which are probably hybrids between the turnip and swede, are more robust, of slower growth and superior feeding value to the white-fleshed turnips, and are less injured by frost.

The swede-turnip, *Brassica campestris*, var. *Napo-brassica*, differs from the turnip proper in having the first foliage-leaves glaucous, not grass-green, in colour, and the later leaves smooth and glaucous; the root bears a distinct neck with well-marked leaf-scars, the flesh is yellow or reddish-orange, firmer and more nutritious, and the roots keep much better during winter. The flowers are larger and buff-yellow or pale orange in colour and the seeds are usually larger and darker than in the turnip.

Turnips should be grown in a rich friable sandy loam, such as will produce medium-sized roots without much aid from the manure heap, and are better flavoured if grown in fresh soil. In light dry soils well decomposed hotbed or farmyard manure is the best that can be used, but in soils containing an excess of organic matter, bone dust, superphosphate of lime, wood-ashes or guano, mixed with light soil, and laid in the drills before sowing the seed, are beneficial by stimulating the young plants to get quickly into rough leaf, and thus to grow out of reach of the so-called turnip fly or turnip flea (*Phyllotreta*). To get rid of this pest, it has been found beneficial to dust the plants with quicklime, and also to draw over the young plants nets smeared with some sticky substance like treacle, by which large numbers will be caught and destroyed. It has been also recommended as a palliative to sow thick in order to allow for a percentage of loss from this and other causes, but this is inadvisable, as overcrowding is apt to render the plants weak. As a preventive, gas-lime may be scattered over the surface after the seed has been sown. Lime is also effective against the disease known as "finger and toe" (*q.v.*).

The first sowing should be made on a warm border, with the protection of a frame or matted hoops, in January or February; the second on a well-sheltered border in March, after which a sowing once a month will generally suffice. In May and June the plot should be in a cool moderately shaded position, lest the plants should suffer from drought. The principal autumn and winter sowings, which are the most important, should be made about the end of June in the northern districts, and in the beginning of July in warmer districts; a small sowing may be made at the end of August to come in before the spring-sown crops are ready. If the weather is showery at the time of sowing, the seed speedily germinates, and the young plants should be kept growing quickly by watering with rain or pond water and by surface stirrings. The drills for the earliest sorts need not be more than 15 in. apart, and the plants may be left moderately thick in the row; the late crops should have at least 2 ft. between the rows, and be thinned to 12 in. in the row, a free circulation of air about them being very important in winter. As a provision against prolonged periods of severe weather it has been recommended to lay the finest roots in rows, covering them well with soil, and leaving intact the whole of the foliage. The very latest sown crops of half-grown roots will prolong the supply until the earliest spring-sown crops are fit for use.

TURNPIKE, a pike or pointed bar or stake which turns or revolves, hence the name given to a form of barrier consisting of three or more horizontal bars, with one end sharpened, revolving on a pivot. Such barriers were used across roads, and, when tolls were exacted from passengers along highways to raise the money for the upkeep of the roads, the name, though not the form, was given both to the toll-gates set up at different places where the tolls were collected, and to the highways repaired under the system (see HIGHWAY).

A "turnstile," consisting of a vertical post with projecting, revolving arms, is another form of barrier, placed by the side of a gate across a road, or across a path to prevent the passage of all except foot passengers, or at the entrance to any building, park or other place as a means of controlling the admission of people, of collecting admission money and the like.

TURNSTONE, the name long given[1] to a shore-bird, from its habit of turning over with its bill such stones as it can to seek its food in the small crustaceans or other animals lurking beneath them. It is the *Tringa interpres*[2] of Linnaeus and *Strepsilas interpres* of most later writers, and is remarkable as being perhaps the most cosmopolitan of birds; for, though properly belonging to the northern hemisphere, there is scarcely a sea-coast in the world on which it may not occur: it has been obtained from Spitzbergen to the Strait of Magellan and from Point Barrow to the Cape of Good Hope and New Zealand—examples from the southern hemisphere being, however, almost invariably in a state of plumage that shows, if not immaturity, yet an ineptitude for reproduction. It also, though much less commonly, resorts

[1] The name seems to appear first in F. Willughby's *Ornithologia* (p. 231) in 1676; but he gave as an *alias* that of Sea-Dottrel, under which name a drawing, figured by him (pl. 58), was sent to him by Sir Thomas Browne.

[2] Linnaeus (*Oel. och Gothländska Resa*, p. 217), who first met with this bird on the island of Gottland (July 1, 1741), was under the mistaken belief that it was there called Tolk (=*interpres*). But that name properly belongs to the REDSHANK (*q.v.*), from the cry of warning to other animals that it utters on the approach of danger.

to the margins of inland rivers and lakes; but it is very rarely seen except near water, and salt water for preference.

The turnstone is about as big as an ordinary snipe; but, compared with most of its allies of the group Limicolae, to which it belongs, its form is somewhat heavy, and its legs are short. Still it is brisk in its movements, and its variegated plumage makes it a pleasing bird. Seen in front, its white face, striped with black, and broad black gorget attract attention as it sits, often motionless, on the rocks; while in flight the white of the lower part of the back and white band across the wings are no less conspicuous even at a distance. A nearer view will reveal the rich chestnut of the mantle and upper wing-coverts, and the combination of colours thus exhibited suggests the term "tortoise-shell" often applied to it—the quill-featbers being mostly of a dark brown and its lower parts pure white. The deeper tints are, however, peculiar to the nuptial plumage, or are only to be faintly traced at other times, so that in winter the adults—and the young always—have a much plainer appearance, ashy-grey and white being almost the only hues observable. From the fact that turnstones may be met with at almost any season in various parts of the world, and especially on islands as the Canaries, Azores, and many of those in the British seas, it has been inferred that these birds may breed in such places. In some cases this may prove to be true, but in most evidence to that effect is wanting. In America the breeding-range of this species has not been defined. In Europe there is good reason to suppose that it includes Shetland; but it is on the north-western coast of the Continent, from Jutland to the extreme north of Norway, that the greatest number are reared. The nest, contrary to the habits of most Limicolae, is generally placed under a ledge of rock which shelters the bird from observation,[1] and therein are laid four eggs, of a light olive-green, closely blotched with brown, and hardly to be mistaken for those of any other bird. A second species of turnstone is admitted by some authors and denied by others. This is the *S. melanocephalus* of the Pacific coast of North America, which is on the average larger than *S. interpres*, and never exhibits any of the chestnut colouring.

Though the genus *Strepsilas* seems to be rightly placed among the Charadriidae (see PLOVER), it occupies a somewhat abnormal position among them, and in the form of its short pointed beak and its variegated coloration has hardly any very near relative. (A. N.)

TURNU MAGURELE, the capital of the department of Teleorman, Rumania; $2\frac{1}{2}$ m. N.E. of the confluence of the Olt and Danube, at the terminus of a branch railway. Pop. (1900), 8668. A ferry plies across the Danube to the Bulgarian fortress of Nicopolis. Large quantities of grain are shipped in lighters to Braila. There are some vestiges of a Roman bridge across the Danube, built (*c.* A.D. 330) by Constantine the Great.

TURNU SEVERIN, the capital of the department of Mehedintzi, Rumania, on the main Walachian railway, and on the left bank of the river Danube, below the Iron Gates cataracts. Pop. (1900), 18,628. It is a modern commercial town, having a school of arts and crafts, several churches, and large government yards for the building of river steamers, lighters and tug-boats. There is a considerable trade in livestock, preserved meat, petroleum and cereals. The town, which was originally called Drobetae by the Romans, took its later name of Turris Severi, or the "Tower of Severus," from a tower which stood on a small hill surrounded by a deep fosse. This was built to commemorate a victory over the Quadi and Marcomanni, by the Roman emperor Severus (A.D. 222–235). Near Turnu Severin are the remains of the celebrated Trajan's bridge, the largest in the Roman Empire, built in A.D. 103 by the architect Apollodorus of Damascus. The river is about 4000 ft. broad at this spot. The bridge was composed of twenty arches supported by stone pillars, several of which are still visible at low water.

TURPENTINE (in M. Eng. *turbentine*, adapted through the O. Fr. *turbentine* or *terebentine* from Lat. *terebinthina*, sc. *resina*, resin of the terebinth, Gr. τερέβινθος or τέρμινθος), the oleo-resins which exude from certain trees, especially from some conifers—such as *Pinus sylvestris*—and from the terebinth tree, *Pistacia terebinthus, L.* It was to the product of the latter, now known as Chian turpentine, that the term was first applied. The terebinth tree and its resin were well known and highly prized from the earliest times. The tree is a native of the islands and shores of the Mediterranean, passing eastward into Central Asia; but the resinous exudation found in commerce is collected in the island of Chios. Chian turpentine is a tenacious semi-fluid transparent body, yellow to dull brown in colour, with an agreeable resinous odour and little taste. On exposure to the air it becomes dry, hard and brittle. In their natural characters, turpentines are soft solids or semi-fluid bodies, consisting of resins dissolved in turpentine oil, the chief constituent of which is pinene. They are largely used in the arts, being separated by distillation into rosin or colophony (see ROSIN), and oil or spirit of turpentine.

Crude or *common turpentine* is the commercial name which embraces the oleo-resin yielded by several coniferous trees, both European and American. The principal European product, sometimes distinguished as Bordeaux turpentine, is obtained from the cluster pine, *Pinus Pinaster*, in the Landes department of France. Crude turpentine is further yielded by the Scotch fir, *P. sylvestris*, throughout northern Europe, and by the Corsican pine, *P. Laricio*, in Austria and Corsica. In the United States the turpentine-yielding pines are the swamp pine, *P. australis*, and the loblolly, *P. Taeda*, both inhabiting North and South Carolina, Georgia and Alabama. *Venice turpentine* is yielded by the larch tree, *Larix europaea*, from which it is collected principally in Tirol. *Strassburg turpentine* is obtained from the bark of the silver fir; but it is collected only in small quantities. Less known turpentines are obtained from the mountain pine, *P. Pumilio*, the stone pine, *P. Cembra*, the Aleppo pine, *P. halepensis*, &c. The so-called *Canada balsam*, from *Abies balsamea*, is also a true turpentine.

Oil of Turpentine, or *Turps*, as a commercial product is obtained from all or any of these oleo-resins, but on a large scale only from crude or common turpentine. The essential oil is rectified by redistillation with water and alkaline carbonates, and the water which the oil carries over with it is removed by a further distillation over calcium chloride. Oil of turpentine is a colourless liquid of oily consistence, with a strong characteristic odour and a hot disagreeable taste. It begins to boil at about 155° C., and its specific gravity is between 0·860 and 0·880. It rotates the plane of polarized light both to right and left in varying degrees according to its sources, the American product being dextrorotatory and the French laevorotatory. It is almost insoluble in water, is miscible with absolute alcohol and ether, and dissolves sulphur, phosphorus, resins and caoutchouc. On exposure to the air it dries to a solid resin, and absorbing oxygen gives off ozone—a reaction utilized in the disinfectant called "Sanitas." Agitated with successive quantities of sulphuric acid and distilled in a current of steam, it yields terebene, a mixture of dipentene and terpinene mainly, which is used in medicine. Chemically, oil of turpentine is a more or less complex mixture of hydrocarbons generically named terpenes (*q.v.*). Oil of turpentine is largely used in the preparation of varnishes and as a medium by painters in their "flat" colours.

Pharmacology and Therapeutics.—Oil of turpentine (*Oleum terebinthinae*) is administered internally as an anthelmintic to kill tapeworm. Applied externally it possesses, in higher degree than any of its fellows, the properties of the volatile oils. It acts as a rubefacient, an irritant and a counter-irritant. It is also an antiseptic and, in small quantities, a feeble anaesthetic. It is absorbed by the unbroken skin. The drug is largely employed as a counter-irritant, the pharmacopoeial liniments being very useful applications. Such conditions as myalgia, bronchitis, "chronic rheumatism" and pleurisy are often relieved by its use. It may also be employed as a parasiticide in ringworm and similar conditions.

In large doses oil of turpentine causes purging and may induce much haemorrhage from the bowel; it should be combined with some trustworthy aperient, such as castor oil, when given as an anthelmintic. It is readily absorbed unchanged and has a marked contractile action upon the blood vessels. This gives it the rare and valuable property of a remote haemostatic, erroneously supposed to be possessed by so many useless drugs. It must not be used to check haemorrhage from the kidneys (haematuria) owing to its irritant action on those organs, but in haemoptysis (haemorrhage from the lungs) it is often an invaluable remedy. In large doses it has a depressant action on the nervous system, leading even to coma and total abolition of reflex action. The drug is excreted partly by the bronchi—which it tends to disinfect—and partly in the urine, which it causes to smell of violets. Glycuronic acid also appears in the urine. A small portion of the drug is removed by the skin, in which it may give rise to an erythematous rash. It must not be given to the subjects of Bright's disease.

Perhaps the most valuable of all the medicinal applications of turpentine, and one which is rarely, if ever, mentioned in therapeutic textbooks—owing to the fact that gynaecology has been so extremely specialized—is in inoperable cancer of the uterus. Quite

[1] There is little external difference between the sexes, and the brightly contrasted colours of the hen-bird seem to require some kind of concealment.

90% of these cases are seen too late for operation, and nearly all recur after operation. The exhausting pain, the serious haemorrhages, and the abdominal septicity associated with a repulsive odour and the absorption of toxic products, which are the chief and ultimately fatal symptoms of that disease, are all directly combated by the administration of oil of turpentine. So beneficial is the action that for years there prevailed the unfortunately erroneous belief that Chian turpentine is actually curative in this condition. But it undoubtedly prolongs life, lessens suffering, and by checking the growth of bacteria upon the cancer reduces the fetid odour and the symptoms of septic intoxication.

Old turpentine and French oil of turpentine are antidotes to phosphorus, forming turpentine-phosphoric acid, which is inert.

TURPIN (d. *c.* 800), archbishop of Reims, was for many years regarded as the author of the legendary *Historia de vita Caroli Magni et Rolandi*, and appears as one of the twelve peers in a number of the *chansons de geste*. He is probably identical with Tilpin, archbishop of Reims in the 8th century, who is alluded to by Hincmar, his third successor in the see. According to Flodoard, Charles Martel drove Rigobert, archbishop of Reims, from his office and replaced him by a warrior clerk named Milo, afterwards bishop of Trier. The same writer represents Milo as discharging a mission among the Vascones, or Basques, the very people to whom authentic history has ascribed the great disaster which befell the army of Charlemagne at Roncesvalles. It is thus possible that the warlike legends which have gathered around the name of Turpin are due to some confusion of his identity with that of his martial predecessor. Flodoard says that Tilpin was originally a monk at St Denis, and Hincmar tells how after his appointment to Reims he occupied himself in securing the restoration of the rights and properties of his church, the revenues and prestige of which had been impaired under Milo's rule. Tilpin was elected archbishop between 752 and 768, probably in 753; he died, if the evidence of a diploma alluded to by Mabillon may be trusted, in 794, although it has been stated that this event took place on the 2nd of September 800. Hincmar, who composed his epitaph, makes him bishop for over forty years, and from this it is evident that he was elected about 753, and Flodoard says that he died in the forty-seventh year of his archbishopric. Tilpin was present at the Council of Rome in 769, and at the request of Charlemagne Pope Adrian I. sent him the pallium and confirmed the rights of his church.

The *Historia Caroli Magni* was declared authentic in 1122 by Pope Calixtus II. It is, however, entirely legendary, being rather the crystallization of earlier Roland legends than the source of later ones, and its popularity seems to date from the latter part of the 12th century. Gaston Paris, who made a special study of the *Historia*, considers that the first five chapters were written by a monk of Compostella in the 11th century and the remainder by a monk of Vienne between 1109 and 1119. The popularity of the work is attested by the fact that there are at least five French translations of the *Historia* dating from the 13th century and one into Latin verse of about the same time. According to August Potthast there are about fifty manuscripts of the story in existence. The *Historia* was first printed in 1566 at Frankfort; perhaps the best edition is the one edited by F. Castets as *Turpini historia Karoli magni et Rotholandi* (Paris, 1880). It has been translated many times into French and also into German, Danish and English. The English translation is by T. Rodd and is in the *History of Charles the Great and Orlando, ascribed to Turpin* (London, 1812). See G. Paris, *De pseudo-Turpino* (Paris, 1865), and *Histoire poétique de Charlemagne*, new ed. by P. Meyer (1905); and V. Friedel, " Études compostellanes " in *Otia Merceiana* (Liverpool, 1899).

TURPIN, FRANÇOIS HENRI (1709–1799), French man of letters, was born at Caen. He was first a professor at the university of his native town, then went to seek his fortunes in Paris, where he made some stir in philosophical circles, and especially in that of the magnificent Helvétius; but he was only enabled with difficulty to earn a livelihood by putting his pen at the service of the booksellers. He translated, or rather adapted from the English, Edward W. Montague's *Histoire du gouvernement des anciennes républiques* (1769), and wrote a continuation of Father Pierre Joseph d'Orléans, *Histoire des révolutions d'Angleterre* (1786). His *Histoire naturelle et civile du royaume de Siam* (1771) is an interesting but faulty adaptation of the observations of a vicar-apostolic who had lived for a long time in that country, and who accused Turpin of having misrepresented his ideas. His chief work, *La France illustre, ou Le Plutarque français*, contains the biographies of generals, ministers, and eminent officers of the law (5 vols., 1777–1790), in which, however, as La Harpe said, he showed himself to be " ni Plutarque ni Français." He also wrote an *Histoire des hommes publics tirés du tiers état* (1789).

TURPIN, RICHARD [Dick] (1706–1739), English robber, was born in 1706 at Hempstead, near Saffron Walden, Essex, where his father kept an alehouse. He was apprenticed to a butcher, but, having been detected at cattle-stealing, joined a notorious gang of deer-stealers and smugglers in Essex. This gang also made a practice of robbing farmhouses, terrorizing the women in the absence of their husbands and brothers, and Turpin took the lead in this class of outrage. On the gang being broken up Turpin went into partnership with Tom King, a well-known highwayman. To avoid arrest he finally left Essex for Lincolnshire and Yorkshire, where he set up under an assumed name as a horse dealer. He was convicted at York assizes of horse-stealing and hanged on the 7th of April 1739. Harrison Ainsworth, in his romance *Rookwood*, gives a spirited account of a wonderful ride by Dick Turpin on his mare, Black Bess, from London to York, and it is in this connexion that Turpin's name has been generally remembered. But as far as Turpin is concerned the incident is pure fiction. A somewhat similar story was told about a certain John Nevison, known as " Nicks," a well-known highwayman in the time of Charles II., who to establish an alibi rode from Gad's Hill to York (some 190 m.) in about 15 hours. Both stories are possibly only different versions of an old north road myth.

TURQUOISE, a mineral much used as an ornamental stone for the sake of its blue or bluish-green colour. It is generally held that the name indicates its source as a stone from Turkey, the finest kinds having come from Persia by way of Turkey, whence it was called by the Venetians who imported it *turchesa*, and by the French *turquoise*. The old form *turkis*, used by Tennyson, agrees with the German *Türkis*. Some authorities have suggested that the word may be a corruption of the Persian name of the stone *piruzeh*. Turquoise is a crypto-crystalline mineral, occurring in small reniform nodules or as an incrustation, or in thin seams and disseminated grains. Its mode of occurrence suggests its formation by deposition from solution, and indeed it is sometimes found in stalactitic masses. The typical colour is a delicate sky-blue, but the blue passes by every transition into green. In some cases the colour deteriorates as the stone becomes dry, and may be seriously affected by exposure to sunlight; whilst with age there is often a tendency to become green, as seen in examples of ancient turquoise. The mineral is always opaque in mass, but generally translucent in thin splinters. Turquoise takes a fair polish, but the lustre is feeble, and inclines to be waxy; the hardness is nearly 6, the specific gravity between 2·6 and 2·8.

Much discussion has arisen as to the chemical composition of turquoise. It is commonly regarded as a hydrous aluminium phosphate having the composition $2Al_2O_3 \cdot P_2O_5 \cdot 5H_2O$ or rather $Al_2HPO_4(OH)_4$, coloured with a variable proportion of a copper phosphate, or perhaps partly with an iron phosphate. Professor S. L. Penfield, however, has been led by careful analysis of turquoise from Nevada to propose the general formula: $[Al(OH)_2, Fe(OH)_2, Cu(OH), H]_3PO_4$. Hence turquoise may be regarded chemically as derived from orthophosphoric acid by replacement of the hydrogen by the univalent radicles $Al(OH)_2$, &c. An ingenious counterfeit of turquoise has been formed by compressing a precipitate of cupriferous aluminium phosphate.

Turquoise is usually cut as an ornamental stone in circular or elliptical form, with a low convex surface. In the East, where it is used not only for personal ornament but for the decoration of dagger-handles, horse-trappings, &c., the pieces are not unusually of irregular shape; and when worn as amulets the turquoise is often engraved with Oriental inscriptions, generally passages from the Korān, the incised characters being gilt or inlaid with gold wire. The turquoise has always been associated with curious superstitions, the most common being the notion that it changes colour with variations in the state of the owner's health or even in sympathy with his affections. It is commonly held to be a " lucky stone."

In Persia, where the finest turquoise is found, the mines have been worked for at least eight centuries. The workings have been described by General Houtum Schindler, an Austrian, who was at one time in charge of the mines. The principal locality is north-west of the village of Madan, on the southern slopes of Mt Ali-Mirsai, a peak near Nishapur, in the province of Khorasan. Here the turquoise occurs in narrow seams in a brecciated trachyte-porphyry. It is found also in some other localities in Persia and in Turkestan. Jean Baptiste Tavernier (1605–1689) states that the best turquoise, reserved for the sole use of the shah, was obtained from the Vieille Roche, whilst inferior stones were got from the Nouvelle Roche. These terms still survive, for turquoise of fine colour is sometimes said in trade to be from the "old rock," and that of pale tint or of unstable colours is described as from the "new rock." The latter is sometimes not true Oriental turquoise, but the material called "bone-turquoise" or odontolite, and known also as "occidental turquoise." This is merely fossil bone or ivory coloured by iron phosphate (vivianite) or perhaps stained in some cases by cupriferous solutions, and is readily distinguished from true turquoise by showing organic structure under the microscope. Bone-turquoise occurs in Europe; and it may be noted that mineral turquoise also is known from certain localities in Saxony and Silesia, but the quantity is very limited and the quality poor, so that it has no commercial importance. Chrysocolla has been sometimes mistaken in various parts of the world for turquoise.

In 1849 turquoise was found by Major C. Macdonald in Wadi Maghara and Wadi Sidreh in the Sinaitic Peninsula; and a large series of the specimens was shown in the Great Exhibition of 1851. According to H. Bauerman, who described the locality geologically, the turquoise occurs in a red sandstone, in the form of embedded nodules and as an incrustation lining the joint-faces. The turquoise was worked for some time by Macdonald, and many years afterwards workings were resumed on a systematic scale by an English company, but without great success. Relics of extensive ancient mining operations for turquoise show that the rock was at one time worked with flint implements. The locality was examined by Professor Flinders Petrie in 1905.

In ancient Mexico much use was made of turquoise as an inlay for mosaic work, with obsidian, malachite, shell and iron pyrites. Such work is illustrated by fine specimens in the ethnographical gallery of the British Museum and elsewhere. Relics of extensive workings are found in the mountains of Los Cerillos near Santa Fé in New Mexico, where mining for turquoise is now actively carried on. One of the hills in which old workings occur has been called Mt Chalchihuitl, since it is believed that the turquoise was known by the name chalchihuitl, which in some places was applied also to jade. Another of the Cerillos hills in which workings have been opened up is called Turquoise Hill. The matrix at Los Cerillos is described by D. W. Johnson as an altered angite-andesite, in which the turquoise occurs in thin veins and in small nodules in patches of kaolin. It appears probable that the alumina of the turquoise was derived from the alteration of felspar, and the phosphorus from apatite in the rock, whilst the copper was brought up by heated vapours which altered the andesite. Turquoise is found also at Turquoise Mountain, Cochise county, Arizona, and at Mineral Park, Mohave county, in the same state; it occurs in the Columbus district, southern Nevada; in Fresno county, California; and near Idaho, Clay county, Alabama. Mexican turquoise is known from the state of Zacatecas. Turquoise was discovered in 1894 near Bodalla, in New South Wales; and it has also been found in Victoria.

Turquoise is sometimes termed by mineralogists callaite, since it is believed to be the *callais* of Pliny—a stone which he describes as resembling lapis lazuli, but paler, and in colour more like the shallow sea. The *callaina* of Pliny was a pale green stone from beyond India, whilst his *callaica* was a kind of turbid callaina. The name callainite was suggested by Professor J. D. Dana for a bright green mineral which was found in the form of beads, with stone hatchets, in ancient graves near Mané-er-H'roek (Rock of the Fairy), near Locmariaquer in Brittany, and which A. Damour sought to identify with Pliny's *callais*. The mineral in question seems to be identical with variscite, a hydrous aluminium phosphate named by A. Breithaupt, and occurring as a beautiful green amorphous mineral, sometimes polished as an ornamental stone; fine examples occur in Utah. Somewhat allied to turquoise is the blue mineral called lazulite (to be distinguished from lazurite, see LAPIS LAZULI), which has the formula $(Fe_2Mg)Al_2(OH)(PO_4)$, and has occasionally been used as an ornamental stone. (F. W. R.*)

TURRET (from O. Fr. *tourette*, diminutive of *tour*, tower, mod. Fr. *tourelle*), a small tower, especially at the angles of larger buildings, sometimes overhanging and built on corbels, when it is often called a "bartizan" (*q.v.*), and sometimes rising from the ground.

TURRETIN, or TURRETINI, the name of three Swiss divines.

BENOÎT TURRETIN (1588–1631), the son of Francesco Turretini, a native of Lucca, who settled in Geneva in 1579, was born at Zürich on the 9th of November 1588. He was ordained a pastor in Geneva in 1612, and became professor of theology in 1618. In 1620 he represented the Genevan Church at the national synod of Alais, when the decrees of the synod of Dort were introduced into France; and in 1621 he was sent on a successful mission to the states-general of Holland, and to the authorities of the Hanseatic towns, with reference to the defence of Geneva against the threatened attacks of the duke of Savoy. He published in 1618–1620 (2 vols.) a defence of the Genevan translation of the Bible, *Eine Verleidigung der genfer Bibelübersetzung* (*Défense de la fidélité des traductions de la Bible faites à Genève*), against P. Cotton's *Genève plagiaire*. He died on the 4th of March 1631.

FRANÇOIS TURRETIN (1623–1687), son of the preceding, was born at Geneva on the 17th of October 1623. After studying theology in Geneva, Leiden and France, he became pastor of the Italian congregation in Geneva in 1647; after a brief pastorate at Lyons he again returned to Geneva as professor of theology in 1653, having modestly declined a professorship of philosophy in 1650. He was one of the most influential supporters of the *Formula Consensus Helvetica*, drawn up chiefly by Johann Heinrich Heidegger (1633–1698), in 1675, and of the particular type of Calvinistic theology which that symbol embodied, and an opponent of the theology of Moses Amyraut and the school of Saumur. His *Institutio theologicae elencticae* (3 vols., Geneva 1680–1683) has passed through frequent editions, the last reprint having been made in Edinburgh in 1847–1848. He was also the author of volumes entitled *De satisfactione Christi disputationes* (Geneva, 1666) and *De necessaria secessione nostra ab ecclesia romana* (Geneva, 1687). He died on the 28th of September 1687.

JEAN ALPHONSE TURRETIN (1671–1737), son of the preceding, was born at Geneva on the 13th of August 1671. He studied theology at Geneva under L. Tronchin, and after travelling in Holland, England and France was received into the "Vénérable Compagnie des Pasteurs" of Geneva in 1693. Here he became pastor of the Italian congregation, and in 1697 professor of church history, and later (1705) of theology. During the next forty years of his life he enjoyed great influence in Geneva as the advocate of a more liberal theology than had prevailed under the preceding generation, and it was largely through his instrumentality that the rule obliging ministers to subscribe to the *Formula Consensus Helvetica* was abolished in 1706, and the *Consensus* itself renounced in 1725. He also wrote and laboured for the promotion of union between the Reformed and Lutheran Churches, his most important work in this connexion being *Nubes testium pro moderato et pacifico de rebus theologicis judicio, et instituenda inter Protestantes concordia* (Geneva, 1729). Besides this he wrote *Cogitationes et dissertationes theologicae*, on the principles of natural and revealed religion (2 vols., Geneva, 1737; in French, *Traité de la vérité de la religion chrétienne*) and commentaries on Thessalonians and Romans. He died on the 1st of May 1737.

See E. de Budé, *François et J. Alphonse Turretini* (2 vols., 1880), and *Lettres inédites à Jean Alphonse Turretini* (3 vols., 1887–1888); F. Turretini, *Notice biographique sur Bénédict Turretini* (1871); C. Borgeaud, *Histoire de l'université de Genève* (1900).

TURRIFF, a municipal and police burgh of Aberdeenshire, Scotland. Pop. (1901), 2273. It lies near the Deveron, 38½ m. N.W. of Aberdeen by the Great North of Scotland railway, via Inveramsay. In the choir of the ancient church, now in ruins, is a fresco painting of St Ninian. On the 14th of May 1639 the national struggle for civil and religious liberty was inaugurated in the county with the skirmish known as the Trot of Turriff. Some 4 m. south are the remains of the castle of Towie Barclay, the seat of the old family of the Barclays.

TURRIS LIBISONIS (mod. Porto Torres, *q.v.*), an ancient seaport town of Sardinia, situated at the north-western extremity of the island, and connected with Carales by two roads, which diverged at Othoca, one (the more important) keeping inland and the other following the west coast. It was probably of purely Roman origin, founded apparently by Julius Caesar, as it bears the title Colonia Julia; and in Pliny's time it was the only colony in the island. It is noteworthy that it apparently belonged to one of the urban tribes, the Collina; Puteoli, which belonged to the Palatina is the only other exception to the rule that *municipia* and *coloniae* were not enrolled in the urban tribes. A Roman bridge of seven arches, somewhat restored in modern times, the ruins of a temple (now known as Il Palazzo del Re Barbaro), which an inscription found there shows to have been restored (A.D. 247–249) by the *praefectus* of the province, together with the basilica, an aqueduct, various buildings (S. Valero Usni in *Notizie degli scavi* (1882), 121, A. Taramelli, ibid. (1904), 145) and some rock tombs, still exist.

The inscriptions from Turris Libisonis are given by Th. Mommsen in *Corp. inscr. lat.* x. 826; V. Dessì in *Notizie degli scavi* (1898), 260; A. Taramelli, ibid. (1904), 141. One of them (*C.I.L.* No. 7954) mentions the construction of a fountain basin, another the construction of a quay (*ripa turritana*): substructions may still be seen under water when the sea is clear. (T. As.)

TURSHIZ, a district of the province of Khorasan in Persia, lying E. of the great salt desert. It has a population of nearly 20,000 and pays a yearly revenue of about £7000. It produces and exports wool, cotton, silk and much dried fruit, of the latter particularly raisins and Alū Bukhara, "Bokhara prunes." The chief place and capital of the district is Sultanabad, generally called Turshiz, like the district, situated 225 m. south-east by east from Shahrud and 100 m. south-west from Meshed, in 35° 10′ N. 58° 34′ E., at an elevation of 2200 ft. It is surrounded by a dilapidated wall and has a population of about 8000.

TURTON, an urban district in the Westhoughton parliamentary division of Lancashire, England, 4 m. N. of Bolton, on the Lancashire & Yorkshire railway. Pop. (1901), 12,355. Its modern growth is the result of the development of the cotton trade in its various branches; and there are large stone quarries in the vicinity. There remains in the township a curious building named Turton Tower, dating principally from the 16th century, and containing some fine contemporary woodwork.

TUSCALOOSA, a city and the county-seat of Tuscaloosa county, Alabama, U.S.A., in the west-central part of the state, on the Black Warrior river, about 55 m. S.W. of Birmingham and about 100 m. N.W. of Montgomery. Pop. (1900), 5094; (local census, 1908), 7140 (3551 negroes); (1910 U.S. census), 8407. It is served by the Alabama Great Southern and the Mobile & Ohio railways. The Black Warrior river, formerly not navigable beyond Tuscaloosa, has been improved by the United States government, and there are three locks in or near the city. Tuscaloosa lies between the foothills of the Appalachians to the north-east and the low alluvial valley of the Black Warrior. It has many old-fashioned residences and gardens, and a fine Federal building. It is the seat of the university of Alabama; of the Alabama Central Female College (Baptist, 1858), which occupies the old state capitol; of the Tuscaloosa Female College (Methodist Episcopal, South, 1860); of Stillman Institute (Presbyterian, 1876; originally the Tuscaloosa Institute for the Education of Coloured Ministers; named in honour of its founder, Dr Charles A. Stillman, in 1897); and of Alabama Bryce Hospital for the Insane (1861). The university of Alabama was founded by an act of the state legislature of 1820, the United States government having donated 46,080 acres of public lands for this purpose in the preceding year; in 1831 the university was opened at Tuscaloosa, then the state capital. On the 4th of April 1865 all the buildings of the university, except the observatory, were burned by a body of Federal cavalry, and the university was closed thereafter until 1869; in 1884 the United States government gave another 46,080 acres of public lands in restitution, and in 1907 the state legislature appropriated $445,000 for new buildings. The university is a part of the public school system of the state, and is governed by a board of trustees, consisting of the governor and the superintendent of education of the state, of two members from the congressional district in which the university is situated, and of one member from each of the other congressional districts of the state. The university includes, besides a college and a graduate school, departments of engineering, law, medicine (formerly the Medical College of Alabama, established in 1859) and pharmacy (the two last in Mobile), and a summer school for teachers, and in 1908-9 had 60 instructors and 887 students. In the city there are several manufacturing establishments, principally cotton and lumber mills; and in the immediate vicinity there are important coal, coke and iron interests—there is a large iron furnace, pipe foundry and coking plant at Holt, about 4 m. north-east of the city.

Tuscaloosa derives its name from an Indian chief, who, after a desperate battle with De Soto at Mauvilla (the site of which is not definitely known) in 1540, is said to have hanged himself in order to escape capture, and is commemorated by a granite monolith in the Court House Square; the name is said to mean "black warrior." The first settlement of whites was made in 1815. The city was chartered in 1819, and in 1826–1846 it was the capital of Alabama.

TUSCANA (mod. Toscanella, *q.v.*), an ancient town of Etruria, about 15 m. N.E. of Tarquinii. It is hardly mentioned in ancient literature; it was a station on the road from Blera to Saturnia, a prolongation of the Via Clodia. On the hill of S. Pietro are remains of walling of the Roman period. A number of Etruscan tombs were found by the Campanari brothers in the 19th century, and their valuable contents are in various European museums.

TUSCANY (*Toscana*), a territorial division of Italy, consisting of the western part of the centre of the peninsula, bounded N.W. by Liguria and Emilia, E. by the Marches and Umbria, S.E. by the province of Rome and W. by the Mediterranean. It consists of eight provinces, Arezzo, Firenze (Florence), Grosseto, Livorno (Leghorn), Lucca, Massa-Carrara, Pisa and Siena, and has an area of 9304 sq. m. Pop. (1901), 2,566,741. The chief railway centre is Florence, whence radiate lines to Bologna (for Milan and the north), Faenza, Lucca, Pisa and Leghorn, and Arezzo for Rome. Siena stands on a branch leaving the Florence-Pisa line at Empoli and running through the centre of Tuscany to Chiusi, where it joins the Florence-Rome railway. The line from Rome to Genoa runs along the coast throughout the entire length of Tuscany, and at Montepescali throws off a branch joining the Empoli-Chiusi line at Asciano, and at Follonica another to Massa Marittima.

Except towards the coast and around Lucca, Florence and Arezzo, where the beds of prehistoric lakes form plains, the country is hilly, being intersected with sub-Apennine spurs. The most fertile country in Tuscany is in the valley of the Arno, where the plains and slopes of the hills are highly cultivated. In strong contrast with this is the coast plain known as the Maremma, 850 sq. m. in extent, where malaria has been prevalent since the depopulation of the country in the middle ages. Here in the first half of the 19th century the grand duke Leopold II. of Tuscany began an elaborate system of drainage, which was gradually extended until it covered nearly the whole of the district. The greater part of the Maremma now affords pasture to large herds of horses and half-wild cattle, but on the drier parts corn is grown, the people coming down from the hills to sow and to reap. The hill country just inland, especially near Volterra, has poor soil, largely clayey, and subject to landslips, but is rich in minerals. But for the Maremma, Tuscany is one of the most favoured regions of Italy. The climate is temperate, and the rainfall not excessive. The Apennines shelter it from the cold north winds, and the prevailing winds in the west, blowing in from the Tyrrhenian Sea, are warm and humid, though Florence is colder and more windy than Rome in the winter and hotter in summer, owing to its being shut in among the mountains. Wheat, maize, wine (especially the red wine which takes the name of Chianti from the district S.S.W. of Florence), olive oil, tobacco, chestnuts and flowers are the chief products of Tuscany. Mules, sheep and cattle are bred, and beeswax is produced in large quantities. But the real wealth of Tuscany lies in its minerals. Iron, mercury, boracic acid, copper, salt, lignite, statuary marble, alabaster and Sienese earth are all found in considerable quantities, while mineral and hot springs abound, some of which (*e.g.* Montecatini and Bagni di Lucca) are well known as health resorts. The industries of Tuscany are exceedingly varied and carried on with great activity. There are universities at Pisa and Siena. Viareggio and Leghorn are much frequented for sea-bathing, while the latter is a prosperous port.

The main art centres of Tuscany are Florence, Pisa and Siena, the headquarters of the chief schools of painting and sculpture from the 13th century onwards. While the former city, however, bore as prominent a part as any in Italy in the Renaissance, the art of Pisa ceased, owing to the political decline of the city, to make any advance at a comparatively early period, its importance being in ecclesiastical architecture in the 12th, and in sculpture in the 13th century. Siena, too, never accepted the Renaissance to the full, and its art retained an individual character without making much progress.

The language of Tuscany is remarkable for its purity of idiom, and its adoption by Dante and Petrarch probably led to its becoming the literary language of Italy. (See ITALIAN LANGUAGE, vol. xiv. p. 895.)

See E. Repetti, *Dizionario geografico fisico storico della Toscana* (6 vols., Florence, 1834–1846). See also G. Dennis, *Cities and Cemeteries of Etruria* (2 vols., London, 1883). On medieval and Renaissance architecture and art there are innumerable works. Among those on architecture may be mentioned the great work of H. von Geymüller and A. Widmann, *Die Architektur der Renaissance in Toscana.* (T. As.)

History.—Etruria (*q.v.*) was finally annexed to Rome in 351 B.C., and constituted the seventh of the eleven regions into which Italy was, for administrative purposes, divided by Augustus. Under Constantine it was united into one province with Umbria, an arrangement which subsisted until at least 400, as the *Notitia* speaks of a "consularis Tusciae et Umbriae." In Ammianus Marcellinus there is implied a distinction between "Tuscia suburbicaria" and "Tuscia annonaria," the latter being that portion which lies to the north of the Arno. After the fall of the Western empire Tuscia, with other provinces of Italy, came successively under the sway of Herulians, Ostrogoths, and Greek and Lombard dukes. Under the last-named, "Tuscia Langobardorum," comprising the districts of Viterbo, Corneto and Bolsena, was distinguished from "Tuscia Regni," which lay more to the north. Under Charlemagne the name of Tuscia or Toscana became restricted to the latter only. One of the earliest of the Frankish marquises was Boniface, either first or second of that name, who about 828 fought with success against the Saracens in Africa. Adalbert I., who succeeded him, in 878 espoused the cause of Carloman as against his brother Louis III. of France, and suffered excommunication and imprisonment in consequence. Adalbert II. (the Rich), who married the ambitious Bertha, daughter of Lothair, king of Lorraine, took a prominent part in the politics of his day. A subsequent marquis, Hugo (the Great), became also duke of Spoleto in 989. The male line of marquises ended with Boniface II. (or III.), who was murdered in 1052. His widow, Beatrice, in 1055 married Godfrey, duke of Lorraine, and governed the country till her death in 1076, when she was succeeded by Matilda (*q.v.*), her only child by her first husband. Matilda died in 1114 without issue, bequeathing all her extensive possessions to the Church. The consequent struggle between the popes, who claimed the inheritance, and the emperors, who maintained that the countess had no right to dispose of imperial fiefs, enabled the principal cities of Tuscany gradually to assert their independence. The most important of these Tuscan republics were Florence, Pisa, Siena, Arezzo, Pistoia and Lucca.

The Return of the Medici.—After the surrender of Florence to the Imperialists in August 1530 the Medici power was re-established by the emperor Charles V. and Pope Clement VII., although certain outward forms of republicanism were preserved, and Alessandro de' Medici was made duke of Florence, the dignity to be hereditary in the family. In the reign of Cosimo III. Siena was annexed (1559); the title of grand duke of Tuscany was conferred on that ruler in 1567 by Pope Pius V. and recognized in the person of Francis I. by the emperor Maximilian II. in 1576. Under a series of degenerate Medici the history of Tuscany is certainly not a splendid record, and few events of importance occurred save court scandals. The people became more and more impoverished and degraded, a new and shoddy nobility was created and granted wide privileges, and art and letters declined. Giovan Gastone was the last Medicean grand duke; being childless, it was agreed by the treaty of Vienna that at his death Tuscany should be given to Francis, duke of Lorraine, husband of the archduchess Maria Theresa, afterwards empress. In 1737 Giovan Gastone died,[1] and Francis II., after taking possession of the grand duchy, appointed a regency under the prince of Craon and departed for Austria never to return. Tuscany was governed by a series of foreign regents and was a prey to adventurers from Lorraine and elsewhere; although the administration was not wholly inefficient and introduced some useful reforms, the people were ground by taxes to pay for the apanage of Francis in Vienna and for Austrian wars, and reduced to a state of great poverty. Francis, who had been elected emperor in 1745, died in 1765, and was succeeded on the throne of the grand duchy by his younger son, Leopold I.

The Reforms of Leopold II.

Leopold resided in Tuscany and proved one of the most capable and remarkable of the reforming princes of the 18th century. He substituted Tuscans for foreigners in government offices, introduced a system of free trade in foodstuffs (at the suggestion of the Sienese Sallustio Bandini), promoted agriculture, and reclaimed wide areas of marshland to intensive cultivation. He reorganized taxation on a basis of equality for all citizens, thereby abolishing one of the most vexatious privileges of the nobility, reformed the administration of justice and local government, suppressed torture and capital punishment, and substituted a citizen militia for the standing army. His reforms in church matters made a great stir at the time, for he curbed the power of the clergy, suppressed some religious houses, reduced the mortmain and rejected papal interference. With the aid of Scipione de' Ricci, bishop of Pistoia, he even attempted to remove abuses, reform church discipline and purify religious worship; but Ricci's action was condemned by Rome. Ricci was forced to resign, and the whole movement came to nothing. (See PISTOIA, SYNOD OF.) The grand duke also contemplated granting a form of constitution, but his Teutonic rigidity was not popular and many of his reforms were ahead of the times and not appreciated by the people. At the death of his brother, Joseph II., in 1790, Leopold became emperor, and repaired to Vienna. After a brief regency he appointed his second son, Ferdinand III., who had been born and brought up in Tuscany, grand duke.

The French Occupation.

During the French revolutionary wars Ferdinand tried to maintain neutrality so as to avoid foreign invasions, but in 1799 a French force entered Florence and was welcomed by a small number of republicans. The grand duke was forced to fly, the "tree of liberty" was set up, and a provisional government on French lines established. But the great mass of the people were horrified at the irreligious character of the new régime, and a counter-revolution, fomented by Pope Pius VII., the grand ducalists and the clergy, broke out at Arezzo. Bands of armed peasants marched through the country to the cry of "Viva Maria!" and expelled the French, not without committing many atrocities. With the assistance of the Austrians, who put an end to disorder, Florence was occupied and the grand ducalists established a government in the name of Ferdinand. But after Napoleon Bonaparte's victory at Marengo the French returned in great force, dispersed the bands, and re-entered Florence (October 1800). They too committed atrocities and sacked the churches, but they were more warmly welcomed than before by the people, who had experienced Austro-Aretine rule. Joachim Murat (afterwards king of Naples) set up a provisional government, and by the peace of Lunéville Tuscany was made a part of the Spanish dominions and erected into the kingdom of Etruria under Louis, duke of Parma (1801). The new king died in 1803, leaving an infant son, Charles Louis, under the regency of his widow, Marie Louise of Spain. Marie Louise ruled with

[1] The history of Tuscany from 1530 to 1737 is given in greater detail under MEDICI.

reactionary and clerical tendencies until 1807, when the emperor Napoleon obliged Charles IV. of Spain to cede Tuscany to him, compensating Charles Louis in Portugal.

From 1807 to 1809, when Napoleon's sister, Elisa Baciocchi, was made grand duchess, Tuscany was ruled by a French administrator-general; the French codes were introduced, and Tuscany became a French department. French ideas had gained some adherents among the Tuscans, but to the majority the new institutions, although they produced much progress, were distasteful as subversive of cherished traditions. After Napoleon's defeats in 1814 Murat seceded from the emperor and occupied Tuscany, which he afterwards handed over to Austria, and in September Ferdinand III. returned, warmly welcomed by nearly everybody, for French rule had proved oppressive, especially on account of the heavy taxes and the drain of conscription. At the Congress of Vienna he was formally reinstated with certain additions of territory and the reversion of Lucca. On Napoleon's escape from Elba Murat turned against the Austrians, and Ferdinand had again to leave Florence temporarily; but he returned after Waterloo, and reigned until his death in 1824.

The Restoration. The restoration in Tuscany was unaccompanied by the excesses which characterized it elsewhere, and much of the French legislation was retained. Ferdinand was succeeded by his son, Leopold II., who continued his father's policy of benevolent but somewhat enervating despotism, which produced marked effects on the Tuscan character. In 1847 Lucca was incorporated in the grand duchy. When the political excitement consequent on the election of Pius IX. spread to Tuscany, Leopold made one concession after another, and in February 1848 granted the constitution. A Tuscan contingent took part in the Piedmontese campaign against Austria, but the increase of revolutionary agitation in Tuscany, culminating in the proclamation of the republic (Feb. 9, 1849), led to Leopold's departure for Gaeta to confer with the pope and the king of Naples. Disorder continuing and a large part of the population being still loyal to him, he was invited to return, and he did so, but accepted the protection of an Austrian army, by which act he forfeited his popularity (July 1849). In 1852 he formally abrogated the constitution, and three years later the Austrians departed. When in 1859 a second war between Piedmont and Austria became imminent, the revolutionary agitation, never completely quelled, broke out once more. There was a division of opinion between the moderates, who favoured a constitutional Tuscany under Leopold, but forming part of an Italian federation, and the popular party, who aimed at the expulsion of the house of Lorraine and the unity of Italy under Victor Emmanuel. At last a compromise was arrived at and the grand duke was requested to abdicate in favour of his son, grant a constitution, and take part in the war against Austria. Leopold having rejected these demands, the Florentines rose as one man and obliged him to quit Tuscany (April 27, 1859). A provisional government, led by Ubaldino Beruzzi and afterwards by Bettino Ricasoli, was established. It declared war against Austria and then handed over its authority to Boncompagni, the Sardinian royal commissioner (May 9). A few weeks later a French force under Prince Napoleon landed in Tuscany to threaten Austria's flank, but in the meanwhile the emperor Napoleon made peace with Austria and agreed to the restoration of Leopold and other Italian princes. Victor Emmanuel was obliged to recall the royal commissioners, but together with Cavour he secretly encouraged the provisional governments to resist the return of the despots, and the constituent assemblies of Tuscany, Romagna and the duchies voted for annexation to Sardinia. A Central Italian military league and a customs union were formed, and Cavour having overcome Napoleon's opposition by ceding Nice and Savoy, the king accepted the annexations and appointed his kinsman, Prince Carignano, viceroy of Central Italy with Ricasoli as governor-general (March 22, 1860).

Union with the Italian Kingdom. The Sardinian parliament which met in April contained deputies from Central Italy, and after the occupation of the Neapolitan provinces and Sicily the kingdom of Italy was proclaimed (Feb. 18, 1861). In 1865, in consequence of the Franco-Italian convention of September 1864, the capital was transferred from Turin to Florence, where it remained until it was removed to Rome in 1871.

Since the union with Italy, Tuscany has ceased to constitute a separate political entity, although the people still preserve definite regional characteristics. It has increased in wealth and education, and owing to a good system of land tenure the peasantry are among the most prosperous in Italy.

TUSCARORA, a tribe of North American Indians of Iroquoian stock. Their former range was on the Neuse river, North Carolina. Here in 1700 they lived in fifteen villages and were estimated at 6000. In 1711, as a protest against the encroachments on their territory, they declared war on the white settlers. After two years they were defeated and fled north to the Iroquois, in whose famous league they became the sixth nation, settling on the territory of the Oneida Indians, in New York state. In the War of American Independence some of the tribe fought for the English and some against them. The remnant of them is divided between reservations in Canada and New York, and numbers about 700.

TUSCULUM, an ancient city of Latium, situated in a commanding position on the north edge of the outer crater ring of the Alban volcano, $1\frac{1}{2}$ m. N.E. of the modern Frascati. The highest point is 2198 ft. above sea-level. It has a very extensive view of the Campagna, with Rome lying 15 m. distant to the north-west. Rome was approached by the Via Latina (from which a branch road ascended to Tusculum, while the main road passed through the valley to the south of it), or by the Via Tusculana (though the antiquity of the latter road is doubtful).

According to tradition, the city was founded by Telegonus, the son of Ulysses and Circe. When Tarquinius Superbus was expelled from Rome his cause was espoused by the chief of Tusculum, Octavius Mamilius, who took a leading part in the formation of the Latin League, composed of the thirty principal cities of Latium, banded together against Rome. Mamilius commanded the Latin army at the battle of Lake Regillus (497 B.C.), but was killed, and the predominance of Rome among the Latin cities was practically established. According to some accounts Tusculum became from that time an ally of Rome, and on that account frequently incurred the hostility of the other Latin cities. In 381 B.C., after an expression of complete submission to Rome, the people of Tusculum received the Roman franchise, but without the vote, and thenceforth the city continued to hold the rank of a *municipium*. Other accounts, however, speak of Tusculum as often allied with Rome's enemies—last of all with the Samnites in 323 B.C. Several of the chief Roman families were of Tusculan origin, *e.g.* the gentes Mamilia, Fulvia, Fonteia, Juventia and Porcia; to the last-named the celebrated Catos belonged. The town council kept the name of senate, but the title of dictator gave place to that of aedile. Notwithstanding this, and the fact that a special college of Roman *equites* was formed to take charge of the cults of the gods at Tusculum, and especially of the Dioscuri, the citizens resident there were neither numerous nor men of distinction. The villas of the neighbourhood had indeed acquired greater importance than the not easily accessible town itself, and by the end of the Republic, and still more during the imperial period, the territory of Tusculum was one of the favourite places of residence of the wealthy Romans. The number and extent of the remains almost defy description, and can only be made clear by a map. Even in the time of Cicero we hear of eighteen owners of villas there. Much of the territory (including Cicero's villa), but not the town itself, which lies far too high, was supplied with water by the Aqua Crabra. On the hill of Tusculum itself are remains of a small theatre (excavated in 1839), with a reservoir behind it, and an amphitheatre. Both belong probably to the imperial period, and so does a very large villa (the substructures of which are preserved), by some attributed, but wrongly, to Cicero, by others to Tiberius, near the latter. Between the amphitheatre and the theatre is the site of the Forum, of which nothing is now visible, and to the south on a projecting spur were tombs of the Roman period. There are also many remains of houses and villas. The citadel—which stood on the highest point an abrupt rock—was approached only on one side, that towards the city, and even here by a steep ascent of 150 ft. Upon it remains of the medieval castle, which stood here until 1191, alone are visible. The city walls, of which some remains still exist below the theatre, are built of blocks of the native "lapis Albanus" or peperino. They probably belong to the republican period. Below them is a well-house, with a roof formed of a pointed arch—generally held to go back to a somewhat remote antiquity, but hardly with sufficient reason.

The most interesting associations of the city are those connected with Cicero, whose favourite residence and retreat for study and literary work was at, or rather near, Tusculum. It was here that he composed his celebrated *Tusculan Disputations* and other philosophical works. Much has been written on the position of his villa, but its true site still remains doubtful. The theory, which places it at or near Grotta Ferrata, some distance farther to the west, has most evidence to support it. Although Cicero (*Pro Sestio*, 43) speaks of his own house as being insignificant in size compared to that of his neighbour Gabinius, yet we gather from other notices in various parts of his works that it was a considerable building. It comprised two gymnasia (*Div.* i. 5), with covered *porticus* for exercise and philosophical discussion (*Tusc. Disp.* ii. 3). One of these, which stood on higher ground, was called "the Lyceum," and contained a library (*Div.* ii. 3); the other, on a lower site, shaded by rows of trees, was called "the Academy." The main building contained a covered *porticus*, or cloister, with apsidal recesses (*exedrae*) containing seats (see *Ad Fam.* vii. 23). It also had bathrooms (*Ad Fam.* xiv. 20), and contained a number of works of art, both pictures and statues in bronze and marble (*Ep. ad Att.* i. 1, 8, 9, 10). The central atrium appears to have been small, as Cicero speaks of it as an *atriolum* (*Ad Quint. Fr.* iii. 1). The cost of this and the other house which he built at Pompeii led to his being burdened with debt (*Ep. ad Att.* ii. 1). Nothing now exists which can be asserted to be part of Cicero's villa with any degree of certainty. During the imperial period little is recorded about Tusculum; but soon after the transference of the seat of empire to Constantinople it became a very important stronghold, and for some centuries its counts occupied a leading position in Rome and were specially influential in the selection of the popes. During the 12th century there were constant struggles between Rome and Tusculum, and towards the close of the century (1191) the Romans, supported by the German emperor, gained the upper hand, and the walls of Tusculum, together with the whole city, were destroyed.

Grossi-Gondi, *Il Tuscolano nell' età classica* (Rome, 1907); T. Ashby in *Papers of the British School at Rome*, iv. 5 (London, 1907, 1909). (T. As.)

TUSKEGEE, a town and county-seat of Macon county, Alabama, U.S.A., in the east part of the state, about 40 m. E. of Montgomery. Pop. (1900) 2170; (1910) 2803. It is served by the Tuskegee railway, which connects it with Chehaw, 5 m. distant, on the Western railway of Alabama. The city manufactures cotton seed. Tuskegee is chiefly known for its educational institutions—the Tuskegee Normal and Industrial Institute and the Alabama Conference Female College (Methodist Episcopal Church, South; opened 1856). The former was founded in 1880 by an act of the state legislature as the Tuskegee State Normal School, and was opened in July 1881 by Booker T. Washington for the purpose of giving an industrial education to negroes; in 1893 it was incorporated under its present name. In 1899 the national Congress granted to the school 25,000 acres of mineral lands, of which 20,000 acres, valued at $200,000, were unsold in 1909. Andrew Carnegie gave $600,000 to the institute in 1903, and the institute has a Carnegie library (1902), with about 15,000 volumes in 1909. In 1909 the endowment was about $1,389,600, and the school property was valued at about $1,117,660. It had in 1909 a property of 2345 acres (of which 1000 were farm lands, 1145 pasture and wood lands, and 200 school campus), and 100 buildings, many of brick, and nearly all designed and constructed, even to the making of the bricks, by the teachers and students. The state of Alabama appropriated $2000 for teachers' salaries in 1880, increased the appropriation to $3000 in 1884, and for many years gave $4500 annually; the school receives $10,000 annually from the John F. Slater Fund, and the same sum from the General Education Board. The institute comprises an academic department (in which all students are enrolled) with a seven years' course, the Phelps Hall bible training school (1892), with a three years' course, and departments of mechanical industries, industries for girls, and agriculture. The department of agriculture has an experiment station, established by the state in 1896, in which important experiments in cotton breeding have been carried on. There are a farm, a large truck garden, an orchard, and a bakery and canning factory. Forty different industries are taught. Cooking schools and night schools are carried on by the institute in the town of Tuskegee. In 1908–1909 the enrolment was 1494 students, of whom about one-quarter were women, and there were 167 teachers, all negroes. Tuition in the institute is free; board and living cost $8.50 a month; day students are allowed to "work-out" $1.50–$3.00 a month of this amount, and night students may thus pay all their expenses. At Tuskegee under the auspices of the institute are held the annual negro conferences (begun in 1891) and monthly farmers' institutes (begun in 1897); and short courses in agriculture (begun in 1904) are conducted. Farmers' institutes are held throughout the South by teachers of the school. In 1905 the institute took up the work of rural school extension. A model negro village (South Greenwood) has been built west of the institute grounds on land bought by the institute in 1901. Affiliated with the institute and having its headquarters in Tuskegee is the National Negro Business League (1900). The success of the institute is due primarily to its founder and principal, Booker T. Washington, and to the efficient board of trustees, which has included such men as Robert C. Ogden and Seth Low. Tuskegee was settled about 1800.

See Booker T. Washington, *Working With the Hands* (New York, 1904); and Thrasher, *Tuskegee, Its Story and Its Work* (Boston, 1900).

TUSSAUD, MARIE (1760–1850), founder of "Madame Tussaud's Exhibition" of wax figures in London, was born in Berne in 1760, the daughter of Joseph Grosholtz (d. 1760), an army officer. Her uncle, a doctor of Berne, John Christopher Curtius, had attracted the attention of the prince de Conti by his beautiful anatomical wax models, and had been induced to move to Paris, abandon his profession, and practise wax modelling as a fine art. His house became the resort of many of the talented men of the day, and here he brought his niece at the age of six, and taught her to model in wax. She became such an adept that she early modelled many of the great people of France, and was finally sent for to stay at the palace at Versailles to instruct the sister of Louis XVI., Mme Elizabeth, in the popular craze. It was from Curtius's exhibition that the mob obtained the busts of Necker and the duke of Orleans that were carried by the procession when on the 12th of July 1789 the first blood of the French Revolution was shed. During the terrible days that followed Marie Grosholtz was called upon to model the heads of many of the prominent leaders and victims of the Revolution, and was herself for three months a prisoner, having fallen under the suspicion of the committee of public safety. In 1794 she married a Frenchman named Tussaud, from whom she was separated in 1800. Her uncle having died in the former year, after some difficulty she secured permission from Napoleon to leave France, and she took with her to London the nucleus of her collection from the *cabinet de cire* in the Palais Royal, and the idea of her " Chamber of Horrors " from Curtius's *Caverne des Grands Voleurs*, in the Boulevard du Temple. Her wax figures were successfully shown in the Strand on the site of the Lyceum theatre, and through the provinces, and finally the exhibition was established in permanent London quarters in Baker Street in 1833. Here Mme Tussaud died on the 16th of April 1850. She was succeeded by her son Francis Tussaud, he by his son Joseph, and he again by his son John Theodore Tussaud (b. 1859). The exhibition was moved in 1884 to a large building in Marylebone Road.

TUSSER, THOMAS (*c.* 1524–1580), English poet, son of William and Isabella Tusser, was born at Rivenhall, Essex, about 1524. At a very early age he became a chorister in the collegiate chapel of the castle of Wallingford, Berkshire. He appears to have been pressed for service in the King's Chapel, the choristers of which were usually afterwards placed by the king in one of the royal foundations at Oxford or Cambridge. But Tusser entered the choir of St Paul's Cathedral, and from there went to Eton College. He has left a quaint account of his privations at Wallingford, and of the severities of Nicholas Udal at Eton. He was elected to King's College, Cambridge, in 1543, a date which has fixed the earliest limit of his birth-year, as he would have been ineligible at nineteen. From King's College he moved to Trinity Hall, and on leaving Cambridge went to court in the service of William, 1st Baron Paget of Beaudesart, as a musician. After ten years of life at court, he married and settled as a farmer at Cattiwade, Suffolk, near the river Stour, where he wrote his *Hundreth Good Pointes of Husbandrie* (1557, 1561, 1562, &c.). He never remained long in one place. For his wife's health he removed to Ipswich. After her death he married again, and farmed for some time at West Dereham. He then became a singing man in Norwich Cathedral, where he found a good patron in the dean, John Salisbury. After another experiment in farming at Fairsted, Essex, he removed to London, whence he was driven by the plague of 1572–1573 to find refuge at Trinity Hall, being matriculated as a servant of the college in 1573. At the time of his death he was in possession of a small estate at Chesterton, Cambridgeshire, and his will proves that he was not, as has sometimes been stated, in poverty of any kind, but had in some measure the thrift he preached. Thomas Fuller says he " traded at large in oxen, sheep, dairies, grain of all kinds, to no profit"; that he " spread his bread with all sorts of butter, yet none would stick thereon." He died on the 3rd of May 1580. An erroneous inscription at Manningtree, Essex, asserts that he was sixty-five years old.

The *Hundreth Good Pointes* was enlarged to *A Hundreth good pointes of husbandry, lately maried unto a hundreth good poyntes of huswifery* . . . the first extant edition of which, " newly corrected and amplified," is dated 1570. In 1573 appeared *Five hundreth pointes of good husbandry* . . . (reprinted 1577, 1580, 1585, 1586, 1590, &c.). The numerous editions of this book, which contained a metrical autobiography, prove that the homely and practical wisdom of Tusser's verse was appreciated. He gives directions of what is to be done in the farm in every month of the year, and minute instructions for the regulation of domestic affairs in general. The later editions include *A dialogue of wyvynge and thryvynge* (1562). Modern editions are by William Mavor (1812), by H. M. W. (1848), and by W. Payne and Sidney J. Herrtage for the English Dialect Society (1878).

TUTBURY, a town in the Burton parliamentary division of Staffordshire, England, 4½ m. N.W. of Burton-upon-Trent, picturesquely situated on the river Dove, a western tributary of the Trent, which forms the county boundary with Derbyshire. Pop. (1901), 1971. The station of the Great Northern and North Staffordshire railways is in Derbyshire. The fine church of St Mary has a nave of rich Norman work with a remarkable western doorway; there are Early English additions, and the apsidal chancel is a modern imitation of that style. There are ruins of a large castle standing high above the valley; these include a gateway of 14th-century work, strengthened in Caroline times, a wall enclosing the broad " Tilt Yard," and portions of dwelling rooms. Glass is the staple manufacture. Alabaster is found in the neighbourhood.

The early history of Tutbury (*Toteberie, Stutesbury, Tuttebiri, Tudbury*) is very obscure. It is said to have been a seat of the Mercian kings. After the Conquest it was granted to Hugh d'Avranches, who appears to have built the first castle there. At the time of the Domesday Survey the castle was held by Henry de Ferrers, and " in the borough round it were 42 men living by their merchandize alone." Tutbury was the centre of an honour in Norman times, but the town remained small and unimportant, the castle and town continuing in the hands of the Ferrers until 1266, when, owing to Robert de Ferrers's participation in the barons' revolt, they were forfeited to the Crown and granted to Edmund Crouchback, earl of Lancaster. They are still part of the duchy of Lancaster. Tutbury Castle was partially rebuilt by John of Gaunt, whose wife, Constance of Castile, kept her court there. Later it was, for a time, the prison of Mary Queen of Scots. During the Civil War it was held for the king but surrendered to the parliamentary forces (1646), and was reduced to ruins by order of parliament (1647). Richard III. granted to the inhabitants of Tutbury two fairs, to be held respectively on St Katharine's day and the feast of the Invention of the Cross; the fair on the 15th of August was famous until the end of the 18th century for its bull coursing, said to have been originally introduced by John of Gaunt.

In 1831 a large treasure of English silver coins of the 13th and 14th centuries was discovered in the bed of the river, and a series was placed in the British Museum. This treasure was believed to have been lost by Thomas, the rebellious earl of Lancaster, who was driven from Tutbury Castle by Edward II. in 1322.

See Mosley, *History of Castle, Priory and Town of Tutbury* (1832); *Victoria County History*: *Stafford.*

TUTICORIN, a seaport of British India in the Tinnevelly district of Madras. Pop. (1901), 28,048. It is the southern terminus of the South Indian railway, 443 m. S.W. of Madras city. In connexion with this railway a daily steamer runs to Colombo, 149 m. distant by sea. Tuticorin is an old town, long in possession of the Dutch, and has a large Roman Catholic population. It used to be famous for its pearl fisheries, which extended from Cape Comorin to the Pamban Channel between India and Ceylon; but owing to the deepening of the Pamban Channel in 1895 these banks no longer produce the pearl oysters in such remunerative quantities, though conch shells are still found and exported to Bengal. As a set-off to this, Tuticorin has advanced greatly as a port since the opening of the railway in 1875, though it has only an open roadstead, where vessels must anchor two and a half miles from the shore; it is the second port in Madras and the sixth in all India. The exports are chiefly rice and livestock to Ceylon, cotton, tea, coffee and spices. There are factories for ginning and pressing cotton and a cotton mill.

TUTOR (Lat. *tutor*, guardian, *tueri*, to watch over, protect), properly a legal term, borrowed from Roman law, for a guardian of an infant (see Roman Law and Infant). Apart from this usage, which survives particularly in Scots law, the word is chiefly current in an educational sense of a teacher or instructor. It is thus specifically applied to a fellow of a college at a university with particular functions, connected especially with the supervision of the undergraduate members of the college. These functions differ in various universities. Thus, at Oxford, a fellow, who is also a tutor, besides lecturing, or taking his share of the general teaching of the college, has the supervision and responsibility for a certain number of the undergraduates during their period of residence; at Cambridge the tutor has not necessarily any teaching functions to perform, but is more concerned with the economic and social welfare of the pupils assigned to his care. In American universities the term is applied to a teacher who is subordinate to a professor, his appointment being for a year or a term of years.

TUTTLINGEN, a town of Germany, in the kingdom of Württemberg, on the left bank of the Danube, which is here crossed by a bridge, 37 m. by rail N.E. of Schaffhausen, and at the junction of lines to Stuttgart and Ulm. Pop. (1905), 14,627. The town is overlooked by the ruins of the castle of Honberg, which was destroyed during the Thirty Years' War, and has an Evangelical and a Roman Catholic church, several schools, and a monument to Max Schneckenburger (1819–1849), the author of *Die Wacht am Rhein*. Its chief manufactures are shoes, cutlery, surgical instruments and woollen goods, and it has a trade in fruit and grain.

Tuttlingen is a very ancient place, and is chiefly memorable for the victory gained here on the 24th of November 1643 by the Austrians and Bavarians over the French. It was almost totally destroyed by fire in 1803. It has belonged to Württemberg since 1404.

TUXEDO, a town of Orange county, New York, U.S.A., about 40 m. N.N.W. of New York City, near the New Jersey state line. Pop. (1890), 1678; (1900), 2277; (1905), 2865; (1910), 2858. Tuxedo is served by the Erie railway. About 1½ m. west of the railway station is Tuxedo Lake, which with 13,000 acres of surrounding country was taken for debt in 1814 by the elder Pierre Lorillard, who built a shooting-box here and sold wood from the land. The second Pierre Lorillard (1833–1901) formed the Tuxedo Park Association for the development of the tract, and on the 1st of June 1886 the Tuxedo Club and Tuxedo Park were opened; here there has grown up a remarkable collection of private establishments for the enjoyment of country life by certain wealthy families, who form a social club to whom the privileges are restricted. The area covers a variety of wild and cultivated scenery, and is beautifully laid out and utilized; there are golf links, a tennis and racket club, and game preserves, with excellent trout and bass fishing in the lake.

TUY, a city of north-western Spain, in the province of Pontevedra, on the right bank of the river Miño (Portuguese *Minho*), opposite Valença do Minho, which stands on the left bank in Portuguese territory. Pop. (1900), 11,113. Tuy is the southern terminus of the railways to Santiago de Compostela and Corunna; Valença do Minho is the northern terminus of the Portuguese railway to Oporto. Near Tuy rises the Monte San Cristobal, whose far-spreading spurs constitute the fertile and picturesque Vega del Oro. To the east is the river Louro, a right-hand tributary of the Miño abounding in salmon, trout, lamprey, eels and other fishes; and beyond the Louro, on the railway to Corunna, are the hot mineral springs of San Martin de Caldelas. Tuy is a clean and pleasant city with well-built houses, regular streets and many gardens. The cathedral, founded in the 12th century, but largely restored between the 15th and 19th, is of a massive and fortress-like architecture. Its half-ruined cloister and noble eastern façade date from the 14th century. There are several large convents and ancient parish churches, an old episcopal palace, hospitals, good schools, a theatre, and a very handsome bridge over the Miño built in 1885. The industries of Tuy include tanning, brewing, the distillation of spirits and the manufacture of soap. The city has also a brisk agricultural trade.

During part of the 7th century Tuy was the Visigothic capital. It was taken from the Moors by Alphonso VII. in the 12th century. As a frontier fortress it played an important part in the wars between Portugal and Castile.

TVER, a government of central Russia, on the upper Volga, bounded by the governments of Pskov and Novgorod on the W. and N. respectively, Yaroslavl and Vladimir on the E. and Moscow and Smolensk on the S. It has an area of 24,967 sq. m. Lying on the southern slope of the Valdai plateau, and intersected by deep valleys, it has the aspect of a hilly region, but is in reality a plateau 800 to 1000 ft. in altitude. Its highest parts are in the west, where the Volga, Southern Dvina and Msta rise in marshes and lakes. The plateau is built up chiefly of Carboniferous limestones, Lower and Upper, underlain by Devonian and Silurian deposits, which crop out only in the denudations of the lower valleys. The whole is covered by a thick sheet of boulder-clay, the bottom-moraine of the Scandinavo-Russian ice-sheet, and by subsequent Lacustrine deposits. A number of *åsar* or eskers occur on the slopes of the plateau. Ochre, brick, and pottery clays, as also limestone for building, are obtained, and there are chalybeate springs. The soil, which is clayey for the most part, is not fertile as a rule.

Nearly the whole of Tver is drained by the upper Volga and its tributaries, several of which (Vazuza, Dubna, Sestra, Tvertsa and the tributaries of the Mologa) are navigable. The Vyshnevolotsk system of canals connects the Volga (navigable some 60 m. from its source) with the Baltic, and the Tikhvin system connects the Mologa with Lake Ladoga. The Msta, which flows into Lake Ilmeñ, and its tributary the Tsna drain Tver in the north-west, and the Southern Dvina rises in Ostashkov. This network of rivers highly favours navigation: corn, linseed, spirits, flax, hemp, timber, metals and manufactured wares to the annual value of £1,500,000 are shipped from, or brought to, the river ports of the government. Lakes, ponds and marshes are numerous in the west and north-west, Lake Seliger—near the source of the Volga—and Lake Mztino being the most important. The forests—coniferous in the north and deciduous in the south—are rapidly disappearing, but still cover 32% of the surface. The climate is continental; the average yearly temperature at Tver (41°·5 F.) is the same as that of Orel and Tambov (Jan. 11°, July 67°).

The population was estimated in 1906 as 2,053,000, almost entirely Great Russian, but including about 117,700 Karelians. The government is divided into twelve districts, the chief towns of which are Tver, Byezhetsk, Kalyazin, Kashin, Korsheva, Ostashkov, Rzhev, Staritsa, Torzhok, Vesyegonsk, Vyshniy Volochok and Zubtsov. Nearly 2,000,000 acres are under cereals. The principal crops are rye, wheat, oats, barley and potatoes. The sowing of grass is spreading, owing to the efforts of the *zemstvos* or local councils, and improved machinery is being introduced. Livestock breeding is also important, and dairy produce is exported. Manufactures have grown rapidly. Cotton-mills, flour-mills, tanneries, sugar-refineries, iron-foundries and distilleries are the chief establishments. The government of Tver is also the seat of important village industries, of which a remarkable variety is carried on, nearly every district and even every village having its own speciality. The principal of these are weaving, lace-making, boat-building, and the making of boots, saddlery, coarse pottery, sacks, nets, wooden wares, nails, locks, other hardware and agricultural implements and felt goods.

TVER, a town of Russia, capital of the government of the same name, 104 m. by rail N.W. of Moscow, on both banks of the Volga (here crossed by a floating bridge) at its confluence with the Tvertsa. The low right bank is protected from inundations by a dam. Pop. (1885), 39,280; (1900), 45,644. Tver is an archiepiscopal see of the Orthodox Greek Church. The oldest church dates from 1564, and the cathedral from 1689. A public garden occupies the site of the former fortress. The city possesses a good archaeological museum, housed in a former imperial palace. The industries have developed greatly, especially those in cotton, the chief works being cotton and flour mills, but there are also machinery works, glass works, sawmills, tanneries, railway carriage works and a steamer-building wharf. Among the domestic industries are nail-making and the manufacture of hosiery for export to Moscow and St Petersburg. The traffic of the town is considerable, Tver being an intermediate place for the trade of both capitals with the governments of the upper Volga.

Tver dates its origin from 1180, when a fort was erected at the mouth of the Tvertsa to protect the Suzdal principality against Novgorod. In the 13th century it became the capital of an independent principality, and remained so until the end of the 15th century. Michael, prince of Tver, was killed (1318) fighting against the Tatars, as also was Alexander his son. It long remained an open question whether Moscow or Tver would ultimately gain the supremacy in Great Russia, and it was only with the help of the Tatars that the princes of the former eventually succeeded in breaking down the independence of Tver. In 1486, when the city was almost entirely burned down by the Muscovites, the son of Ivan III. became prince of Tver; the final annexation to Moscow followed four years later. In 1570 Tver had to endure, for some reason now difficult to understand, the vengeance of Ivan the Terrible, who ordered the massacre of 90,000 inhabitants of the principality. In 1609–1612 the city was plundered both by the followers of the second false Demetrius and by the Poles.

TWAIN, MARK, the *nom de plume* of Samuel Langhorne Clemens (1835–1910), American author, who was born on the 30th of November 1835, at Florida, Missouri. His father was a country merchant from Tennessee, who moved soon after his son's birth to Hannibal, Missouri, a little town on the Mississippi. When the boy was only twelve his father died, and thereafter he had to get his education as best he could. Of actual schooling he had little. He learned how to set type, and as a journeyman printer he wandered widely, going even as far east as New York. At seventeen he went back to the Mississippi, determined to become a pilot on a river-steamboat. In his *Life on the Mississippi* he has recorded graphically his experiences while "learning the river." But in 1861 the war broke out, and the pilot's occupation was gone. After a brief period of uncertainty the young man started West with his brother, who had been appointed lieutenant-governor of Nevada. He went to the mines for a season, and there he began to write in the local newspapers, adopting the pen name of "Mark Twain," from a call used in taking soundings on the Mississippi steamboats. He drifted in time to San Francisco, and it was a newspaper of that city which in 1867 supplied the money for him to join a party going on a chartered steamboat to the Mediterranean ports. The letters which he wrote during this voyage were gathered in 1869 into a volume, *The Innocents Abroad*, and the book immediately won a wide and enduring popularity. This popularity was of service to him when he appeared on the platform with a lecture—or rather with an apparently informal talk, rich in admirably delivered anecdote. He edited a daily newspaper in Buffalo for a few months, and in 1870 he married Miss Olivia L. Langdon (d. 1904), removing a year later to Hartford, where he established his home. *Roughing It* was published in 1872, and in 1874 he collaborated with Charles Dudley Warner in *The Gilded Age*, from which he made a play, acted many hundred times with John T. Raymond as "Colonel Sellers." In 1875 he published *The Adventures of Tom Sawyer*, the sequel to which, *Huckleberry Finn*, did not appear until 1884. The result of a second visit to Europe was humorously recorded in *A Tramp Abroad* (1880), followed in 1882 by a more or less historical romance, *The Prince and the Pauper*; and a year later came *Life on the Mississippi*. *The Adventures of Huckleberry Finn*, the next of his books, was published (in 1884) by a New York firm in which the author was chief partner. This firm prospered for a while, and issued in 1889 Mark Twain's own comic romance, *A Connecticut Yankee at King Arthur's Court*, and in 1892 a less successful novel, *The American Claimant*. But after a severe struggle the publishing house failed, leaving the author charged with its very heavy debts. After this disaster he issued a third Mississippi Valley novel, *The Tragedy of Pudd'nhead Wilson*, in 1894, and in 1896 another historical romance, *Personal Recollections of Joan of Arc*, wherein the maid is treated with the utmost sympathy and reverence. He went on a tour round the world, partly to make money by lecturing and partly to get material for another book of travels, published in 1897, and called in America *Following the Equator*, and in England *More Tramps Abroad*. From time to time he had collected into volumes his scattered sketches; of these the first, *The Celebrated Jumping Frog of Calaveras County*, appeared in 1867, and the latest, *The Man that Corrupted Hadleyburg*, in 1900. To be recorded also is a volume of essays and literary criticisms, *How to Tell a Story* (1897). A complete edition of his works was published in twenty-two volumes in 1899–1900 by the American Publishing Company of Hartford. And in this last year, having paid off all the debts of his old firm, he returned to America. By the time he died his books had brought him a considerable fortune. In later years he published a few minor volumes of fiction, and a series of severe and also amusing criticisms of Christian Science (published as a book in 1907), and in 1906 he began an autobiography in the *North American Review*. He had a great reception in England in 1907, when he went over to receive from Oxford the degree of Doctor of Literature. He died at Redding, Connecticut, on the 21st of April 1910. Of his four daughters only one, who married the Russian pianist Gabrilowitch, survived him. Mark Twain was an outstanding figure for many years as a popular American personality in the world of letters. He is commonly considered as a humorist, and no doubt he is a humorist of a remarkable comic force and of a refreshing fertility. But the books in which his humour is broadly displayed, the travels and the sketches, are not really so significant of his power as the three novels of the Mississippi, *Tom Sawyer*, *Huckleberry Finn* and *Pudd'nhead Wilson*, wherein we have preserved a vanished civilization, peopled with typical figures, and presented with inexorable veracity. There is no lack of humour in them, and there is never a hint of affectation in the writing; indeed, the author, doing spontaneously the work nearest to his hand, was very likely unconscious that he was making a contribution to history. But such *Huckleberry Finn* is, beyond all question; it is a story of very varied interest, now comic, now almost tragic, frequently poetic, unfailingly truthful, although not always sustained at its highest level. And in these three works of fiction there are not only humour and pathos, character and truth, there is also the largeness of outlook on life such as we find only in the works of the masters. Beneath his fun-making we can discern a man who is fundamentally serious, and whose ethical standards are ever lofty. Like Cervantes at times, Mark Twain reveals a depth of melancholy beneath his playful humour, and like Molière always, he has a deep scorn and a burning detestation of all sorts of sham and pretence, a scorching hatred of humbug and hypocrisy. Like Cervantes and like Molière, he is always sincere and direct.

After Mark Twain's death, his intimate friend, W. D. Howells, published in 1910 a series of personal recollections in *Harper's Magazine*. (B. M.)

TWEED, a river in the south of Scotland. It rises in the south-west corner of Peeblesshire, not far from the Devil's Beef Tub (in Dumfriesshire) in the hill country in which the Clyde and Annan also rise. The stream flowing from Tweed's Wall, about 1500 ft. above the sea, is generally regarded as its source, though its origin has been traced to other streams at a still higher elevation. For the first 36 m. of its course the stream intersects the shire of Peebles in a north-easterly direction, and, shortly before the county town is reached, receives Lyne Water on the left and Manor Water on the right. The valley now widens, and the river, bending towards the south-east, passes Innerleithen, where it receives the Leithen (left) and the Quair (right). It then crosses Selkirkshire and, having received the Ettrick (reinforced by the Yarrow) on the right, flows northward past Abbotsford, forming for about 2 m. the boundary between the counties of Selkirk and Roxburgh. After receiving the Gala on the left, the Tweed crosses the north-western corner of Roxburghshire past Melrose and, after being joined by the Leader on the left, winds past Dryburgh Abbey round the south-western corner of Berwickshire. The remainder of its course is in a north-easterly direction through Roxburghshire past Kelso, where it receives the Teviot on the right, and then between the counties of Berwick and Northumberland, past Coldstream, to the town of Berwick, where it enters the North Sea. On the left it receives Eden Water at Edenmouth and Leet Water at Coldstream, and the Till from Northumberland between Coldstream and Norham Castle. The last 2 m. of its course before reaching Berwick are in England. The Tweed is 97 m. long and drains an area of 1870 sq. m. Its bed is pebbly and sandy, and notwithstanding discolorations from manufactures, the stream, owing to its clear and sparkling appearance, still merits the epithet of the "silver Tweed." The river, however, has no estuary, and traffic is chiefly confined to Berwick, though for a short distance above the town some navigation is carried on by barges. The Tweed is one of the best salmon streams in Scotland. From the time of Kenneth the Grim (d. 1005) to that of James VI. (1600) the Tweed uplands were the favourite hunting ground of the Scots monarchs, and, at a later date, the Covenanters found refuge in the recesses of the hills and on the banks of Talla Water, an early right-hand affluent. Close to Stobo Castle is Stobo Kirk, the mother-church of the district, founded by St Kentigern and probably the oldest ecclesiastical building in Tweeddale, a mixture of Saxon, Norman and modern Gothic.

See Sir Thomas Dick Lauder, *Scottish Rivers* (1874); Professor John Veitch, *The River Tweed* (1884); Rev. W. S. Crockett, *The Scott Country* (1892).

TWEEDDALE, MARQUESSES OF. JOHN HAY, 2ND EARL and 1ST MARQUESS OF TWEEDDALE (1626–1697), was the eldest son of John, 8th Lord Hay of Yester (*c.* 1599–1654), created earl of Tweeddale in 1646, who was the grandson of William Lord Hay of Yester (d. 1576), one of the partisans of Mary Queen of Scots, and thus a descendant of John Hay of Yester (Haddingtonshire) who was created a lord of the Scottish parliament in 1488 and died about 1500. Before succeeding to the peerage in 1654 the second earl fought for Charles I. during the Civil War, but he soon transferred his allegiance, and was in the Scottish ranks at Marston Moor. Changing sides again, he was with the royalists at Preston; but he was a member of Cromwell's parliament in 1656, and was imprisoned just after the restoration of Charles II. He was soon, however, in the king's favour, and in 1663 was appointed president of the Scottish council, and in 1664 an extraordinary lord of session. In Scotland he sought to mitigate the harshness shown by the English government to the Covenanters, and for this attitude he was dismissed from his offices in 1674; but he regained an official position in 1680 and held it during the reign of James II. A supporter of William of Orange, he was made lord high chancellor of Scotland in 1692, and two years later was created marquess of Tweeddale and earl of Gifford. He favoured the scheme for the expedition to Darien, and as lord high commissioner during William's absence he formally assented to the act establishing the trading company in 1695; for this action he was dismissed from office when the king returned to England in 1696. He died on the 11th of August 1697.

His son JOHN, 2ND MARQUESS OF TWEEDDALE (1645–1713), was prominent in Scottish politics during the stormy period which preceded the union with England. After acting for a time with the national party he became the leader of the *squadrone volante*, a band of men who at first took up an independent attitude on the question, but afterwards supported the union. For a very short time he was lord chancellor of Scotland, and he was one of the first of the Scottish representative peers. He died on the 20th of April 1713. His eldest son, CHARLES (*c.* 1670–1715), became 3rd marquess; a younger son, Lord JOHN HAY (d. 1706), commanded the famous regiment of dragoons, afterwards called the Scots Greys, at the battle of Ramillies and elsewhere.

JOHN, 4TH MARQUESS OF TWEEDDALE (*c.* 1695–1762), eldest son of the 3rd marquess, was chief secretary of state for Scotland from 1742 to 1746 and extraordinary lord of session from 1721 until his death. In six parliaments he was a representative peer for Scotland; he was for a time keeper of the king's signet, and in 1761 he was made lord-justice-general. He died on the 9th of December 1762. His brother, Lord CHARLES HAY (d. 1760), was the soldier who displayed great coolness when suddenly brought face to face with some French troops at Fontenoy, requesting the enemy, so Voltaire's account runs, to fire first.

The family of the 4th marquess became extinct when GEORGE, the 5th marquess, died on the 4th of October 1770; and GEORGE, a son of the 3rd marquess, succeeded to the title. When he died unmarried on the 16th of November 1787 the marquessate passed to a kinsman, GEORGE (1733–1804), a descendant of the 2nd marquess, who became 7th marquess.

GEORGE, 8TH MARQUESS OF TWEEDDALE (1787–1876), son of the preceding, succeeded in August 1804. He fought in the Peninsular War, being wounded at the battles of Busaco and Vittoria, and then in America; and he attained the rank of a field marshal in 1875. From 1842 to 1848 he was governor and commander-in-chief of Madras, but his later life was mainly spent at Yester, where he showed a very practical interest in agriculture. He died on the 10th of October 1876. His son, ARTHUR (1824–1878), who became 9th marquess, was an ornithologist of repute and a soldier who served in India and the Crimea. His ornithological works were published privately in 1881 by his nephew, Captain R. E. W. Ramsay, with a memoir by Dr W. H. Russell. His successor was his brother, WILLIAM MONTAGU (b. 1826), who, after sitting in the House of Commons for thirteen years, was made a peer of the United Kingdom as Baron Tweeddale in 1881.

TWEEZERS, a small instrument like a pair of tongs, used for picking up minute objects, extracting thorns or splinters from the flesh, &c. Etymologically a "tweezer" is an instrument contained in a "tweeze" or a small case containing several instruments, "tweeze" being a plural form of "twee," an adaptation of French *étui*, a sheath-case or box to put things in. Why one particular instrument out of the case should be called "tweezers" is not certain; Skeat suggests a possible connexion of ideas with the obsolete "twich," "twitch" (Ger. *zwicken*, to nip, fasten, Eng. "tweak"), or reference may be made to the M. Eng. *twisel* or *twissel*, a pair of objects (*twi-*, two).

The derivation of the French *étui* (O. Fr. *estuy*) is doubtful. Cognate forms are Span. *estuche*, Port. *estojo*, Ital. *astuccio*, formerly *stuccio* or *stucchio*, all with the same meaning of a small case for instruments such as scissors, knife, &c. Skeat supports Diez in his connexion with the modern German dialect *Stauche*, cuff, that part of the sleeve where such small objects were carried. Others connect the word with Lat. *studium*, a place where one studies, hence a place where objects of study are carried, a somewhat far-fetched sense development.

TWELVE TABLES, the tables of wood on which was engraved or painted the earliest codification of the Roman law. Originally ten in number, two others were afterwards added, containing supplemental matter, and the whole code was termed the *Lex XII. Tabularum* (Law of the Twelve Tables). (See ROMAN LAW and ROME.)

TWENTY-FOUR PARGANAS, THE, a district of British India, in the presidency division of Bengal, with an area of 4844 sq. m. It occupies part of the Gangetic delta, east of the Hugli, surrounding (but not including) the city of Calcutta. It also includes the greater part of the almost uninhabited Sundarbans (*q.v.*). The administrative headquarters are at Alipur, a southern suburb of Calcutta. The country consists for the most part of a vast alluvial plain, and is everywhere watered by numerous branches of the Ganges. In 1901 the population was 2,078,359, showing an increase of 10 % in the decade. Rice is the staple crop, followed by jute, pulses and sugar-cane. The district is traversed by three railways, two of which terminate at the ports of Diamond Harbour and Port Canning, but numerous river channels are still the chief means of communication. Apart from the suburbs of Calcutta, there is hardly a single real town. But round Calcutta all the manufactures of a great city are to be found, principally jute mills and jute presses, cotton mills and paper mills, and also government factories for rifles and ammunition.

The Twenty-four Parganas form the tract of which the *zamindari* or landlord rights were granted to the East India Company after the battle of Plassey, while the revenue arising therefrom was conferred upon Clive, upon whose death it reverted to the company.

TWICKENHAM, an urban district in the Brentford parliamentary division of Middlesex, England, 12 m. W.S.W. of St Paul's Cathedral, London, on the river Thames. Pop. (1891), 16,027; (1901), 20,991. Its situation is pleasant, and it has grown into an extensive residential district. The body of the church of St Mary was rebuilt in brick after its collapse in 1713, but the Perpendicular tower remains. Among men of eminence buried here are Alexander Pope and Sir Godfrey Kneller. The Thames in this neighbourhood forms a long deep reach in favour with fishermen, and Eel Pie Island is a resort of boating parties. There are many fine houses in the vicinity, more than one possessing historical associations. Strawberry Hill, the residence of Horace Walpole, was built to his taste in a medley of Gothic styles. Marble Hill was erected by George II. for the countess of Suffolk, and Pope, Swift and Gay took part in its equipment. Orleans House was the residence in 1800 of Louis Philippe, then duke of Orleans, and this family again acquired it in 1852, when it was occupied by the duke of Aumale. Several eminent French refugees resided at this period in the neighbourhood. In 1700 the young duke of Gloucester, son of Queen Anne, died here. York House was given to Lord Clarendon by Charles II., was probably the occasional residence of James II. when duke of York, and in 1864 was occupied by the comte de Paris, nephew of the duke of Aumale. Twickenham House was the residence of Sir John Hawkins, author of the *History of Music*, and Twickenham Park House, no longer standing, that of Lord Chancellor Bacon. Pope's Villa was replaced by another building after his death, but the tunnel which connected his garden and house beneath a road, and was ornamented by him as a grotto, remains. Other eminent residents were Turner, who occupied Sandycombe Lodge, and painted many of his famous works here, Henry Fielding the novelist, and Tennyson. Kneller Hall, the house built by Kneller (1711), was converted into a training college for masters of workhouse schools in 1847, and in 1856 became the Royal Military School of Music.

Twickenham at the Domesday survey was included in Isleworth. Anciently it was called Twittenham or Twicanham, and the first form, or a variation of it, is used by both Pope and Walpole. The manor was given in 941 by King Edmund to the monks of Christ Church, Canterbury, from whom it had been previously taken, but it was again alienated, for it was restored to the same monks by Edred in 948. In the reign of Henry VIII. it came into the possession of the Crown, and by Charles I. was assigned to Henrietta Maria as part of her jointure. It was sold during the Protectorate, but after the Restoration the queen mother resumed possession of it. In 1670 it was settled for life on Catherine of Braganza, queen of Charles II. It remains in possession of the Crown, but since the death of Catherine has been let on leases. The old manor house, now demolished, was Catherine's residence; and had been, according to tradition, the place of the retirement of Catherine of Aragon after her divorce from Henry VIII.

TWILIGHT, formerly known as Crepusculum (a Latin word meaning dusky or obscure), properly the interval during which the atmosphere is illuminated after the setting of the sun. The analogous phenomenon in the morning, *i.e.* the interval between the first appearance of light and the rising of the sun, is known as the *dawn*. These phenomena are due to the light of the sun after refraction by the atmosphere being reflected to the observer by the clouds, dust, and other adventitious matter present in the atmosphere. Even in the early infancy of astronomy, the duration of twilight was associated with the position of the sun below the horizon, and measurements were made to determine the maximum vertical depression of the sun which admitted the phenomena. This was found by Alhazen, Tycho Brahe and others, to be about 18°, and although other observers obtained somewhat different values, yet this value is now generally admitted. The duration of twilight is therefore measured by the time in which the sun traverses an arc of 18° of vertical depression, and primarily depends on the latitude of the observer and the declination of the sun. It is subject to several minor variations, occasioned by the variable amount of dust, clouds, &c. suspended in the air; and also on the temperature, which alters the altitude of the reflecting particles; thus at the same place and on the same day, the morning twilight or dawn is generally shorter than the evening twilight.

The duration and possibility of twilight may be geometrically exhibited as follows: Let O be the position of the observer (fig. 1); Z, the zenith; P, the pole of the heavens; ADB, the plane of the horizon; EDF, the path of the sun. Let the circles ADB and FDE intersect in the points D and D_1; then these points correspond to the rising and setting of the sun. Now twilight prevails from sunrise or sunset until the sun is depressed through 18°; hence if we draw arcs ZC and ZC_1 equal to 108°, and terminating on the circle FDE at C and C_1, then the arcs DC and D_1C_1 represent the distance traversed by the sun during the twilight. Also it may be observed that C_1EC represents the path of the sun during the night, and DFD_1 during the day. The arc CD is readily determined by spherical trigonometry. For, join CP by an arc of a great circle; then in the triangle ZPC we know ZP (the colatitude of O); PC (the sun's polar distance) and ZC (=108° by construction). Hence the angle ZPC, the sun's hour angle, may be found; this gives the time before or after noon when the sun passes C. The times of sunrise and sunset being known, then the arcs DC and D_1C_1 (and the duration of dawn and twilight) are determined.

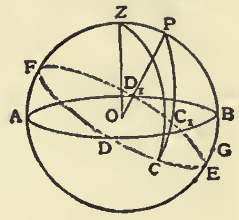

Fig. 1.

So far we have considered the case when the sun does attain a depression of 18°, but it is equally possible for this depression not to be attained. To investigate this, take ZG equal to 108°. Now if G lies beyond B and E (the maximum depression of the sun), E being also below B, then the sun will rise and set, but never descend so low as to occasion true night, and the entire interval between sunrise and sunset will be twilight.

If E be not below B but above it, the sun will never descend below the horizon, and will neither rise nor set, and we are presented with the phenomenon known as the *midnight sun*. Since PE = 90° − sun's declination, and PG = latitude of observer + 18°, then it follows that for there to be no night the latitude of the observer together with the declination of the sun must lie between 90° and 72°.

The maximum declination of the sun is about 23° 30′, and hence in latitude 48° 30′ there will be one day without a true night; in higher latitudes there will be an increasing number of such days; and in lower latitudes none. In England there is no real night from about the 22nd of May till the 22nd of July.

The phenomenon known as the *after-glow*, or second twilight, has been referred to a second reflection of the solar rays in the atmosphere.

TWILL (connected with "two"), a woven cloth in which the passage of the weft is arranged, not in regular succession as in plain weaving, but over one thread and under two or more according to the kind of twill. This gives a succession of diagonal lines to the cloth, and though in the normal type of twill this diagonal traverses from selvage to selvage at an angle of 45°, considerable variations may be made. Twills may be stout and serviceable cloths, though, theoretically, it would seem that the strain of wear on the threads that compose the cloth is necessarily irregular. The twill or diagonal may run either from left to right or vice versa. Twills are made in most kinds of cloths—silk, woollen, cotton, &c.

TWINING, THOMAS (1735–1804), English classical scholar, was born at Twickenham on the 8th of January 1734–1735. The son of Daniel Twining, tea merchant of London, he was originally intended for a commercial life, but his distaste for it and his fondness for study decided his father to send him to the university. He entered Sidney Sussex College, Cambridge (fellow, 1760), took orders, and after his marriage in 1764 spent the remainder of his life at Fordham (Essex) and Colchester, where he died on the 6th of August 1804. His reputation as a classical scholar was established by his translation, with notes, of Aristotle's *Poetics* (1789). Twining was also an accomplished musician, and assisted Charles Burney in his *History of Music*.

Selections from his correspondence will be found in *Recreations and Studies of a Country Clergyman of the Eighteenth Century* (1882) and *Selections from Papers of the Twining Family* (1887), edited by his grand-nephew (Richard Twining); see also *Gentleman's Magazine*, lxxiv. 490, and J. E. Sandys, *History of Classical Scholarship*, vol. iii. (1908).

TWISS, HORACE (1787–1849), English writer and politician, was born at Bath, being the son of Francis Twiss (1760–1827), a Shakespearian scholar who married Mrs Siddons's sister, Fanny Kemble, and whose brother Richard (1747–1821) made a name as a writer of travels. Horace Twiss had a pretty wit, and as a young man wrote light articles for the papers; and, going to the bar, he obtained a considerable practice and became a K.C. in 1827. In 1820 he was elected to parliament, where, with some interruptions, he sat till 1841, holding the office of under-secretary for war and the colonies in 1828–1830. In 1844 he was appointed vice-chancellor of the duchy of Lancaster, a well-paid post which enabled him to enjoy his popularity in London society. For some years he wrote for *The Times*, in which he first compiled the parliamentary summary, and his daughter married first Francis Bacon (d. 1840) and then J. T. Delane, both of them editors of that paper. He was the author of the *Life* (1844) of Lord Eldon, and other volumes. He died suddenly in London on the 4th of May 1849.

TWISS, SIR TRAVERS (1809–1897), English jurist, eldest son of the Rev. Robert Twiss, was born in London on the 19th of March 1809. At University College, Oxford, he obtained a first-class in mathematics and a second in classics in 1830, and was elected a fellow of his college, of which he was afterwards successively bursar, dean and tutor. During his connexion with Oxford he was, *inter alia*, a public examiner in classics and mathematics, Drummond professor of political economy (1842), and regius professor of civil law (1855). After he had forfeited his fellowship by marriage, he was elected to an honorary fellowship of University College. He published while at Oxford an epitome of Niebuhr's *History of Rome*, an annotated edition of Livy and other works, but his studies mainly lay in the direction of political economy, law, chiefly international law, and international politics. In 1840 he was called to the bar at Lincoln's Inn, and became an advocate at Doctors' Commons. In the ecclesiastical courts he enjoyed a large practice, and filled many of the appointments incidental thereto, such as commissary-general of the city and diocese of Canterbury (1849), vicar-general to the archbishop (1852) and chancellor of the diocese of London (1858). He was professor of international law at King's College, London (1852–1855). In 1858, when the Probate and Divorce Acts of 1857 came into force, and the ecclesiastical jurisdiction of Doctors' Commons had passed away, Twiss, like many other leading advocates of Doctors' Commons, became a Q.C., and in the same year he was also elected a bencher of his Inn. His successful career continued in the civil courts, and in addition to his large practice he was appointed in 1862 advocate-general to the admiralty, and in 1867 queen's advocate-general. In 1867 he was also knighted. He served during his legal career upon a great number of royal commissions, such as the Maynooth commission in 1854, and others dealing with marriage law, neutrality, naturalization and allegiance. His reputation abroad led to his being invited by the king of the Belgians in 1884 to draw up the constitution of the Congo Free State. In 1871 Twiss became involved in an unpleasant scandal, occasioned by allegations against the ante-nuptial conduct of his wife, whom he had married in 1862; and he threw up all his appointments and lived in retirement in London until his death on the 14th of January 1897, devoting himself to the study of international law and kindred topics. Among his more notable publications of this period were *The Law of Nations in Peace* and *The Law of Nations in War*, two works by which his reputation as a jurist will chiefly endure.

TWYSDEN, SIR ROGER (1597–1672), English antiquary and royalist pamphleteer, belonging to an ancient Kentish family. His mother, Anne, was the daughter of Sir Moule Finch, and his father, Sir William Twysden, was a courtier and scholar who shared in some of the voyages against the Spaniards in the reign of Queen Elizabeth and was well known at the court of King James I. He was one of the first baronets. Roger Twysden was educated at St Paul's School, London, and then at Emmanuel College, Cambridge. He entered Gray's Inn on the 2nd of February 1623. He succeeded to the baronetcy on his father's death in 1629. For some years he remained on his estate at Roydon, East Peckham, largely engaged in building and planting, but also in studying antiquities and the law of the constitution. The king's attempts to govern without a parliament, and the vexatious interference of his lawyers and clergy with the freedom of all classes of men, offended Sir Roger as they did most other country gentlemen. He showed his determination to stand on his rights by refusing to pay ship money, but, probably because the advisers of the Crown were frightened by the unpopularity of the impost, was not molested. He was chosen member of parliament for Kent in the Short Parliament of 1640, but was not elected to the Long Parliament. In common with most men of his class Sir Roger applauded the early measures of the parliament to restrict the king's prerogative, and then became alarmed when it went on to assail the Church. The attainder of Lord Strafford frightened him as a tyrannical use of power. He became in fact a very typical example of the men who formed the strength of the king's party when the sword was at last drawn. He considered himself too old to serve in the field, and therefore he did not join the king at Oxford. But he took the most prominent part in preparing the Kentish petition of March 1642 and in subsequent demonstrations on behalf of Charles. He incurred the wrath of the parliament, was arrested on the 1st of April 1642, but was soon let out on bail, and on his promise to keep quiet. But his respect for legality would not let him rest, and he was soon in trouble again for another demonstration known as "The Instruction to Mr Augustine Skinner." For this he was again arrested and for a time confined in a public-house, called "The Two Tobacco Pipes," near Charing Cross, London. He was released with a distinct intimation that he would be well advised not to go back to Roydon Hall, but to keep out of temptation in London. He took the advice and applied himself to reading. One plan for going abroad was given up, but at last he endeavoured to escape in disguise, was detected, and brought back to London. He was now subjected to all the vexations inflicted on Royalist partisans of good property, sequestrations of his rents, fines for "malignancy," and confinement in the Tower, where he consoled himself with his books. At last he compounded in 1650 and went home, where he lived quietly till the Restoration, when he resumed his position as magistrate. He died on the 27th of June 1672. He published *The Commons' Liberty* (London, 1648), demonstrating that finings and imprisonings by parliament were illegal; *Historiae anglicanae scriptores decem* (London, 1652), a work encouraged by Cromwell; and *Historical Vindication of the Church of England* (London, 1657).

TYBURN, a small left-bank tributary of the river Thames, England, now having its course entirely within London and below ground. The name, which also occurs as Aye-bourne, is of obscure derivation, though sometimes stated to signify Twy-burn, *i.e.* (the junction of) two burns or streams. The Tyburn rose at Hampstead and ran south, crossing Regent's Park, striking the head of the modern ornamental water there. Its course is marked by the windings of Marylebone Lane, the dip in Piccadilly where that thoroughfare borders the Green Park and at times by a line of mist across the park itself. It joined the Thames at Westminster (*q.v.*). But the name is more famous in its application to the Middlesex gallows, also called Tyburn Tree and Deadly Never Green, and also at an early period, the Elms, through confusion with the place of execution of that name at Smithfield. The Tyburn gallows stood not far from the modern Marble Arch. Connaught Square is said by several authorities to have been the exact site, but it appears that so long as the gallows was a permanent structure it stood at the junction of the present Edgware and Bayswater roads. The site, however, may have varied, for Tyburn was a place of execution as early as the end of the 12th century. In 1759, moreover, a movable gallows superseded the permanent erection. On some occasions its two uprights and cross-beam are said to have actually spanned Edgware Road. Round the gibbet were erected open galleries, the seats in which were let at high prices. Among those executed here were Perkin Warbeck (1449), the Holy Maid of Kent and confederates (1535), Haughton, last prior to the Charterhouse (1535), John Felton, murderer of Villiers, duke of Buckingham (1628), Jack Sheppard (1724), Earl Ferrers (1760).

In 1661 the skeletons of Cromwell, Ireton and other regicides were hung upon the gallows. The last execution took place in 1783, the scene being thereafter transferred to Newgate. The Tyburn Ticket was a certificate given to a prosecutor of a felon on conviction, the first assignee of which was exempted by a statute of William III. from all parish and ward duties within the district. The hangman's halter was colloquially known in the 16th century as the Tyburn Tippet.

See A. Marks, *Tyburn Tree, its History and Annals* (London, 1908).

TYDEUS, in Greek legend, son of Oeneus, king of Calydon, and Periboea. Having slain his uncle (or other relatives) he fled for refuge to Argos, where Adrastus received him hospitably and purified him from the guilt of blood. Tydeus took part in the expedition of the "Seven against Thebes," in which, although small of stature, he greatly distinguished himself. In the desperate battle under the walls of the city, he was severely wounded by Melanippus, but managed to slay his adversary. Athena, who held Tydeus in special favour, hastened to the field of battle, to heal him of his wound and bestow immortality upon him. But the sight of Tydeus, cleaving open the skull of his dead enemy and sucking out his brains, so disgusted her that she left him to his fate. Tydeus married Deïpylē, the daughter of Adrastus, by whom he had a son, the famous Diomedes, frequently called Tydides.

Homer, *Iliad*, xiv. 114–132; Apollodorus iii. 6, 8; Schol. on Pindar, *Nemea*, x. 12.

TYLDESLEY with **SHAKERLEY,** an urban district in the Leigh parliamentary division of Lancashire, England, 11 m. W.N.W. from Manchester by the London & North Western railway. Pop. (1901), 14,843. The town is of modern growth and depends upon its cotton mills and the large collieries in the neighbourhood.

TYLER, JOHN (1790–1862), tenth president of the United States, was born at Greenway, Charles City county, Virginia, on the 29th of March 1790. He was the second son of John Tyler (1747–1813), governor of Virginia in 1808–1811 and United States district judge in 1812–1813. The family was of English descent, but the claim of relationship to the famous Wat Tyler, though always stoutly maintained by President Tyler, cannot be substantiated. John Tyler the younger entered the grammar-school of the College of William and Mary, at Williamsburg, in 1802, and graduated in 1807. Two years later he was admitted to the bar. His public life began in 1811, when he was elected a member of the Virginia House of Delegates. Here he served for five years, being chosen also in 1815 a member of the council of state. In 1813 he raised a company for the defence of Richmond against the British, serving subsequently in minor operations elsewhere. From December 1816 to March 1821 he was a member of the national House of Representatives. A Republican in politics, and a firm believer in the doctrines of strict construction and state sovereignty which Thomas Jefferson had been principally instrumental in formulating, he opposed consistently the demand for internal improvements and increased tariff duties, and declined to follow Henry Clay in the proposed recognition of the independence of the Spanish colonies in South America and in the Missouri Compromise legislation. For the conduct of Jackson in Florida, in the summary execution of Arbuthnot and Ambrister, he had only strong condemnation. He declined a re-election to the House in 1821. In 1823–1825 he was again a member of the Virginia House of Delegates, and in 1825–1827 was governor of the state. In 1827 he was elected to the United States Senate to succeed John Randolph. In 1829–1830 he also served as a member of the Virginia constitutional convention. His career as senator was marked by a degree of independence which at times made his party position uncertain, notwithstanding the fact that his political ideas continued to be those of a thoroughgoing strict constructionist. Believing protective tariff duties to be unconstitutional, he voted against the "tariff of abominations" in 1828, and also against the tariff of 1832, since the latter measure, though reducing duties, showed no abandonment of the protective principle. The compromise tariff of 1833, made necessary by the hostile attitude of South Carolina, owed its inception largely to him, but he voted against the "force bill," an act for enforcing the collection of duties, being the only senator whose vote was so recorded. His hostility to a high tariff policy, however, did not prevent him from condemning the South Carolina ordinance of nullification; and in the presidential election of 1832 he supported Andrew Jackson, to whose political principles and methods, as to those of his advisers, he was invincibly opposed, as the "least objectionable" of the various candidates. The vigorous course of the president towards South Carolina, however, led him, after 1833, to act more and more with the opposition which presently became the Whig party; but he was never at heart a Whig, at least as Whig principles came later to be defined, and his place is with the Democrats of the Calhoun school. He sought to incorporate in a new code for the District of Columbia, in 1832, a prohibition of the slave trade in the district, at the same time opposing the abolition of slavery there without the consent of Maryland and Virginia, which had originally ceded the district to the United States. In the controversy over the removal of the government deposits from the Bank of the United States he sided with the bank, and voted for Clay's resolution censuring Jackson for his course in the matter. In 1833 he was again elected to the Senate, notwithstanding the criticism of his independent attitude and the wide approval of Jackson's policy in regard to the bank. In the election of 1836 he was supported as a candidate for the vice-presidency by the friends of Hugh L. White of Tennessee, the Democratic candidate opposed to Martin Van Buren, and received 47 votes, none of them from Virginia. When the legislature of Virginia voted instructions to its senators to support Senator Thomas H. Benton's resolution expunging from the journal of the Senate the resolution of censure, Tyler, though admitting the right of instruction, could not conscientiously obey the mandate, and on the 29th of February 1836 he resigned his seat. He was by this time reckoned a Whig, and his refusal to favour the Van Buren administration lent colour to that view. In 1838 he became once more a member of the Virginia House of Delegates, and in the same year was chosen president of the Virginia Colonization Society, of which he had long been a vice-president. In 1839 he made an unsuccessful contest for the United States senatorship. In December of that year the Whigs, relying upon his record in Congress as a sufficient declaration of political faith, nominated him for vice-president on the ticket with William Henry Harrison, expecting that the nomination would win support for the party in the South. Harrison and Tyler each received 234 electoral votes and were elected. On the 4th of April 1841, one month after the inauguration, Harrison died, and Tyler became president. The detailed discussion of the events of his administration, 1841–1845, belongs to the history of the United States (see UNITED STATES: *History*). He retained Harrison's cabinet until his veto of the bill for a "fiscal corporation" led to the resignation of all the members except Daniel Webster, who was bringing to a close the negotiations with Lord Ashburton for the settlement of the north-eastern boundary dispute; and he not only opposed the recognition of the spoils system in appointments and removals, but kept at their posts some of the ablest of the ministers abroad. He stood, however, as it were, midway between the two great parties, without the leadership or support of either; Van Buren, whose influence in the practical working of politics was still great, refused to recognize him as a Democrat, and the Whigs repudiated him as a Whig; while with Clay leading the majority in Congress, harmony between that body and the executive was from the first impossible. The annexation of Texas, achieved just before the close of his administration, seemed to commend him for a second term on that issue, and in May 1844 he was renominated by a convention of Democrats, irregularly chosen, at Baltimore. The majority of the annexationists, however, would not support him, and he had further to meet the opposition of Van Buren, who had failed to secure the nomination in the regular Democratic convention, and of James K. Polk, the regular Democratic nominee. Tyler accepted the Baltimore nomination, but on the 20th of August withdrew from the contest. From this time until the eve of the Civil War he held no public office, but his opinions on political questions continued to be sought, and he was much in demand as a speaker on public occasions. In December 1860, when South Carolina adopted its ordinance of secession, Tyler, though sympathizing with the state, took firm ground against disunion and exerted himself in behalf of peace. The legislature of Virginia appointed him a commissioner to confer with President Buchanan and arrange, if possible, for the maintenance of the *status quo* in the matter of Fort Sumter, in Charleston harbour; but his efforts were unavailing. He did not abate his activity, however, and the Peace Congress which assembled at Washington on the 4th of February 1861, pursuant to a resolution of the Virginia legislature, and over which he presided, was largely the result of his labours. The constitutional amendment proposed by the conference, however, did not meet with his approbation, and his action in signing and transmitting the resolution to Congress was merely formal. On the 13th of February, while absent in Washington on this mission, he was elected to the Virginia convention at Richmond, and took his seat on the 1st of March. In the convention he advocated immediate secession as the only proper course under the circumstances. He continued to serve as a member of the convention until it adjourned in December, in the meantime acting as one of the commissioners to negotiate a temporary union between Virginia and the Confederate States of America. He was also a member of the provisional Confederate Congress from May 1861, when the capital of the Confederacy was removed from Montgomery, Alabama, to Richmond. He was elected a member of the House of Representatives of the permanent Congress, but died on the 18th of January 1862, in Richmond, before that body assembled.

President Tyler was twice married, first in 1813 to Miss Letitia Christian (1790–1842), and second in 1844 to Miss Julia Gardiner (1820–1889). His son, LYON GARDINER TYLER (b. 1853), graduated at the university of Virginia in 1875, and practised law at Richmond, Virginia, from 1882 to 1888, when he became president of the College of William and Mary. Among his publications, besides *Letters and Times of the Tylers*, are *Parties and Patronage in the United States* (1890); *Cradle of the Republic* (1900); *England in America* (1906) in the "American Nation" series, and *Williamsburg, the Old Colonial Capital* (1908).

The principal authority for the life of Tyler, aside from speeches, messages and other documents, is Lyon G. Tyler, *Letters and Times of the Tylers* (3 vols., Richmond, Va., 1884–1896). (W. MAC D.*)

TYLER, MOSES COIT (1835–1900), American author, was born in Griswold, Connecticut, on the 2nd of August 1835. At an early age he removed with his parents to Detroit, Michigan. He entered the university of Michigan in 1853, but in the next year went to Yale College, from which he graduated A.B. in 1857, and received the degree of A.M. in 1863. He studied for the Congregational ministry at the Yale Divinity School (1857–1858) and at the Andover Theological Seminary (1858–1859), and held a pastorate at Owego, New York, in 1859–1860 and at Poughkeepsie in 1860–1862. Owing to ill-health, however, and a change in his theological beliefs, he left the ministry. He became interested in physical training, and for some time (partly in England) wrote and lectured on the subject, besides other journalistic work. He became professor of English language and literature in the university of Michigan in 1867, and held that position until 1881, except in 1873–1874 when he was literary editor of the *Christian Union*; from 1881 until his death on the 28th of December 1900 at Ithaca, New York, he was professor of American history at Cornell University. In 1881 he was ordained deacon in the Protestant Episcopal Church and in 1883 priest, but he never undertook parochial work. Most important among his works are his valuable and original *History of American Literature during the Colonial Time, 1607–1765* (2 vols., 1878; revised in 1897), and *Literary History of the American Revolution, 1763–1783* (2 vols., 1897). Supplementary to these two is his *Three Men of Letters* (1895), containing biographical and critical chapters on George Berkeley, Timothy Dwight and Joel Barlow. In addition he published *The Brawnville Papers* (1869), a series of essays on physical culture; a revision of Henry Morley's *Manual of English Literature* (1879); *In Memoriam: Edgar Kelsey Apgar* (1886), privately printed; *Patrick Henry* (1887), an excellent biography, in the "American Statesmen" series; and *Glimpses of England: Social, Political, Literary* (1898), a selection from his sketches written while abroad.

See "Moses Coit Tyler," by Professor William P. Trent, in *The Forum* (Aug. 1901), and an article by Professor George L. Burr, in the *Annual Report of the American Historical Association* for 1901 (vol. i.).

TYLER, WAT [or WALTER] (d. 1381), English rebel, a man of obscure origin, was a native either of Kent or of Essex. Nothing definite is known of him previous to the outbreak of the peasant revolt in 1381, but Froissart says he had served as a soldier in the French War, and a Kentishman in the retinue of Richard II. professed to identify him as a notorious rogue and robber of Kent. The name Tyler, or Teghler, is a trade designation and not a surname. The discontent of the rural labourers and of the poorer class of craftsmen in the towns, caused by the economic distress that followed the Black Death and the enactment of the Statute of Labourers in 1351, was brought to a head by the imposition of a poll tax in 1379 and again in 1381, and at the end of May in the latter year riots broke out at Brentwood in Essex; on the 4th of June similar violence occurred at Dartford; and on the 6th a mob several thousands strong seized the castle of Rochester and marched up the Medway to Maidstone. Here they chose Wat Tyler to be their leader, and in the next few days the rising spread over Kent, where much pillage and damage to property occurred. On the 10th Tyler seized Canterbury, sacked the palace of Archbishop Sudbury, the chancellor, and beheaded three citizens as "traitors." Next day he led his followers, strengthened by many Kentish recruits, on the road to London, being joined at Maidstone by John Ball (*q.v.*), whom the mob had liberated from the archbishop's prison. Reaching Blackheath on the 12th, the insurgents burnt the prisons in Southwark and pillaged the archbishop's palace at Lambeth, while another body of rebels from Essex encamped at Mile End. King Richard II. was at the Tower, but neither the king's councillors nor the municipal authorities had taken any measures to cope with the rising. The drawbridge of London Bridge having been lowered by treachery, Tyler and his followers crossed the Thames; and being joined by thousands of London apprentices, artisans and criminals, they sacked and burnt John of Gaunt's splendid palace of the Savoy, the official residence of the treasurer, Sir Robert Hales, and the prisons of Newgate and the Fleet. On the 14th Richard II., a boy of fourteen, undertook the perilous enterprise of riding out to confer with the rebels beyond the city wall. At Mile End the king met Wat Tyler; a lengthy and tumultuous conference, during which several persons were slain, took place, in which Tyler demanded the immediate abolition of serfdom and all feudal services, and the removal of all restrictions on freedom of labour and trade, as well as a general amnesty for the insurgents. Richard had no choice but to concede these demands, and charters were immediately drawn up to give effect to them. While this was in progress Tyler with a small band of followers returned to the Tower, which they entered, and dragged forth Archbishop Sudbury and Sir Robert Hales from the chapel and murdered them on Tower Hill. During the following night and day London was given over to plunder and slaughter, the victims being chiefly Flemish merchants, lawyers and personal adherents of John of Gaunt, duke of Lancaster. Meantime the people of property began to organize themselves for the restoration of order. On the 15th of June, Richard, after confession and receiving the Sacrament, rode to Smithfield for a further conference with the rebels. Close to St Bartholomew's Church he met Wat Tyler, who advanced from the ranks of the insurgents and shook the king's hand, bidding him be of good cheer. Tyler then formulated a number of fresh demands, including the confiscation of ecclesiastical estates and the institution of social equality. Richard replied that the popular desire should be satisfied "saving the regalities of the Crown." Tyler thereupon grew insolent, and in the altercation that ensued the rebel leader was killed by the mayor, Sir William Walworth (*q.v.*), and John Standwick, one of the king's squires. The rebels now handled their bows in a menacing fashion, but at the critical moment the young king with great presence of mind and courage spurred his horse into the open, crying, "Sirs, will you shoot your king? I will be your chief and captain, you shall have from me all that you seek." Richard then led the mob to a neighbouring meadow, where he kept them in parley till Walworth, who had returned within the city to summon the loyal citizens to the king's aid, returned with a sufficient following to overawe and disperse the rebels. With the death of Wat Tyler the rising in London and the home counties quickly subsided, though in East Anglia it flickered a short time longer under the leadership of John Wraw and Geoffrey Litster until suppressed by the energy of Henry Despenser, bishop of Norwich. About 110 persons were executed for the rebellion in Kent and Essex, including John Ball, and Jack Straw, Tyler's chief lieutenant.[1] The enfranchisement of villeins granted by Richard at the Mile End conference was revoked by parliament in 1382, and no permanent results were obtained for the peasants by Wat Tyler's revolt.

BIBLIOGRAPHY.—The best original account of the rebellion of Wat Tyler is the "Anonimal Chronicle of St Mary's, York," printed by G. M. Trevelyan in the *Eng. Hist. Rev.* (1898). See also Thomas Walsingham, *Chronicon Angliae* (Rolls series, 1874); Froissart, *Chronicles* (edited by G. C. Macaulay, London, 1895); André Réville, *Le Soulèvement des travaillers d'Angleterre en 1381* (Paris, 1898); C. TYLER, a city and the county-seat of Smith county, Texas, U.S.A., about 115 m. E. by S. of Dallas. Pop. (1890), 6908; (1900), 8069, of whom 2693 were negroes; (1910 census), 10,400. Tyler is served by the International & Great Northern and the St Louis South-Western railways. It is the seat of the Tyler Commercial College, of the East Texas Conservatory of Music and of two institutions for negroes—Texas College (1895; Colored Methodist Episcopal) and the East Texas Normal and Industrial Academy (Baptist, 1905). The principal public buildings include the city hall, the county court-house, a Carnegie library and the post office and Federal Courts building. Sessions of the United States Circuit and District Courts, and of a state district court, as well as of the county court, are held in Tyler. Tyler is situated in a prosperous agricultural region, and has various manufactures. The St Louis South-Western railway maintains general offices and machine-shops here. Tyler, named in honour of President John Tyler, was settled in 1847, was incorporated as a town in 1870 and was chartered as a city in 1907.

TYLOPODA (Gr. for boss-footed, in reference to the cushion-like pads forming the soles of the feet), the scientific name of the section of ruminating artiodactyle ungulate mammals (see ARTIODACTYLA) now represented by the Old World camels (see CAMEL) and the South American Llamas (see LLAMA)

Characters.—In the skull there is a sagittal crest; the tympanic bulla is filled with cancellous tissue; the condyle of the lower jaw is rounded; and the premaxillae, or anterior bones of the upper jaw, have the full number of incisor teeth in the young state, the outermost of these being persistent through life as an isolated tooth. The tusk-like canines are present in both jaws, those of the lower jaw being differentiated from the long, horizontal and spatulate incisors; in form they are sub-erect and pointed. The crowns of the molars belong to the crescentic or selenodont type, and are tall-crowned or hypsodont; but one or more of the anterior premolars is usually detached from the series, and of simple pointed form. The hinder part of the body is much contracted, and the femur long and vertically placed, so that the knee-joint is lower in position, and the thigh altogether more detached from the abdomen than in most mammals. The limbs are long, but with only two digits (the third and fourth) developed on each, no traces of any of the others being present. The trapezoid and magnum of the carpus, and the cuboid and navicular of the tarsus are distinct. The two cannon-bones of each limb are confluent for the greater part of their length, though separated for a considerable distance at the lower end. Their lower articular surfaces, instead of being pulley-like, with deep ridges and grooves, as in other Artiodactyla, are simple, rounded and smooth. The first phalanges are expanded at their lower ends, and the wide, depressed middle phalanges embedded in a broad cutaneous pad, forming the sole of the foot, on which the animal rests in walking instead of on the hoofs. The terminal phalanges are small and nodular, not flattened on their inner or opposed surfaces, and not completely encased in hoofs, but bearing nails on their upper surface only. The neck is long and curved, and its vertebrae are remarkable for the position of the canal for the transmission of the vertebral artery, which does not perforate the transverse process, but passes obliquely through the anterior part of the pedicle of the arch. There are no horns or antlers. Though these animals ruminate, the stomach differs considerably in the details of its construction from that of the Pecora. The interior of the rumen or paunch has no tags or villi on its surface, and there is no distinct psalterium or manyplies. Both first and second compartments are remarkable for the presence of a number of pouches or cells in their walls, with muscular partitions, and a sphincter-like arrangement of their orifices, by which they can be shut off from the rest of the cavity, and into which the fluid portion only of the contents of the stomach is allowed to enter. The placenta is diffuse, not cotyledonary. Finally, the Tylopoda differ not only from other ungulates, but from all other mammals, in the fact that the red corpuscles of the blood, instead of being circular in outline, are oval as in the inferior vertebrate classes.

Camels.—Of the two existing generic representatives of the Camelidae (as the family in which they are both included is named), the Old World camels (*Camelus*) are characterized by their great bodily size, and the presence of one or two fleshy humps, which diminish or increase in size according to the physical condition of the animals themselves. There is a total of 34 teeth, arranged as $i.\ \frac{1}{3}$, $c.\ \frac{1}{1}$, $p.\ \frac{3}{2}$, $m.\ \frac{3}{3}$. Of these the first upper premolar is a simple tooth placed close behind the premaxilla and separated by a long gap from the two other teeth of the same series; while the lower incisors, of which the outermost is the largest, are directed partially forwards. The skull is elongated, with an overhanging occiput, complete bony rims to the orbits, and the premaxillae separated from the arched and rather long nasals. The vertebrae are C. 7. D. 12. L. 7. S. 4 and Ca. 13 to 15. The ears are short and rounded; the toes of the broad feet very imperfectly separated; the tail is well developed, with a terminal tuft; and the straight hair is not woolly.

Llamas.—Although the name llama properly applies only to one of the domesticated breeds, zoologically it is taken to include all the South American representatives of the Camelidae, which form the genus *Lama*. In this sense, llamas are characterized as follows. The dentition in the adult is $i.\ \frac{1}{3}$, $c.\ \frac{1}{1}$, $p.\ \frac{2}{2}$, $m.\ \frac{3}{3}$; total 32. In the upper jaw there is a compressed, sharp-pointed, tusk-like incisor near the hind edge of the premaxilla, followed in the male at least by a moderate-sized, pointed, curved canine in the anterior part of the maxilla. The isolated canine-like premolar which follows in the camels is not present. The teeth of the cheek-series which are in contact with each other consist of two small premolars (the first almost rudimentary) and three broad molars, constructed generally like those of *Camelus*. In the lower jaw the three incisors are long, spatulate and horizontal, with the outer one the smallest. Next to the latter is a curved, sub-erect canine, followed after an interval by an isolated minute and often deciduous simple conical premolar; then a contiguous series of one premolar and three molars, which differ from those of recent species of *Camelus* in having a small accessory column at the anterior outer edge. The skull generally resembles that of *Camelus*, the relatively larger brain-cavity and orbits and less developed cranial ridges being due to its smaller size. The nasal bones are shorter and broader, and are joined by the premaxillae. Vertebrae: C. 7, D. 12, L. 7, S. 4, Ca. 15 to 20. Ears rather long and pointed. No hump. Feet narrow, the toes being more separated than in the camels, and each with a distinct plantar pad. Tail short. Hairy covering long and woolly. Size smaller and general form lighter than in the camels. Llamas are now confined to the western and southernmost parts of South America, though fossil remains have been found in the caves of Brazil, and in the pampas of the Argentine Republic. (See also ALPACA; GUANACO; LLAMA and VICUGNA.)

Fossil History.—As regards the past history of the group, remains of fossil species of *Camelus* have been obtained from the superficial

[1] Mr F. W. D. Brie (*English Historical Review*, 1906) vol. xxi. advances the theory that Tyler and Straw are one and the same person.

deposits of various parts of Russia, Rumania, and Siberia, and others from the Lower Pliocene of northern India; the molar teeth of these latter presenting the additional column referred to above as distinguishing those of the llamas from those of modern camels. In addition to these Dr M. Schlosser has described remains of a large camel-like animal from China, with apparently generalized affinities, for which the name of *Paracamelus* is proposed. Mme Pavlow, of Moscow, has brought to notice a fossil camel-skull of great interest, which was collected in the district Alexandrie, of the government of Kherson, Russia. Unfortunately, the precise age of the formation from which it was obtained is unknown, but it is considered probable that it dates from the later Tertiary. Although it has the deciduous dentition, Mme Pavlow considers herself justified in referring the Kherson skull to the genus *Procamelus* previously known only from the Lower Pliocene or Upper Miocene strata of North America, and differing from modern camels, among other features, by the retention of a fuller series of premolar teeth. Part of the cannon-bone of a camel from another district in Russia is provisionally assigned to the same species. Possibly this Russian camel (*Procamelus khersonensis*), as it is called, may form the connecting link between the typical *Procamelus* of North America and the fossil camel (*Camelus sivalensis*) of the Siwalik Hills of India. Be this as it may, the identification of a North American type of camel from the Tertiary strata of eastern Europe forms another connecting link between the extinct faunas of the northern half of the Old World and North America, and thus tends to show that the claim of America to be the exclusive birthplace of many Old World types may have to be reconsidered.

Remains of camels (*C. thomasi*) have also been found in the Pleistocene strata of Oran and Ouen Seguen, in Algeria; and certain remains from the Isle of Samos have been assigned to the same genus, although the reference requires confirmation. The Algerian Pleistocene camel was doubtless the direct ancestor of the living African species, which it serves to connect with the extinct *C. sivalensis*.

In North America, apart from certain still older and more primitive mammals, with teeth of the tubercular type, the earliest known form which can definitely be included in the camel-series is *Protylopus*, of the Uinta or Upper Eocene. In this creature, which was not larger than a European hare, there was the full number of 44 teeth, which formed a regular series, without any long gaps, and with the canines but little taller than the incisors, while the hinder cheek-teeth, although of the crescentic type, were low-crowned. In both jaws the anterior front-teeth were of a cutting and compressed type. Unfortunately, the skull is incomplete, and the rest of the skeleton very imperfectly known; but sufficient of the former remains to show that the socket of the eye was open behind, and of the latter to indicate that in the hind-foot, at any rate, the upper bones of the two functional toes had not coalesced into a cannon-bone. The lateral hind-toes (that is to say the second and fifth of the typical series) had, however, become rudimentary; although it is probable that the corresponding digits of the fore-limb were functional, so that this foot was four-toed. In old individuals the bones of the forearm (radius and ulna) became welded together about half-way down, although they remained free above. On the other hand it appears that the smaller bone of the leg (fibula) was welded to the larger one (tibia), and that its upper portion had disappeared. Nothing is known of the neck vertebrae. It is, of course, evident that there must have been an earlier form in which all the feet were four-toed, and the bones of the forearm and lower part of the leg separate.

A stage higher in the series, viz. in the Oligocene, we meet with *Pöebrotherium*, in which a distinct increase in bodily size is noticeable, as also in the relative length of the two bones which unite in the higher types to form the cannon-bone. Moreover, the crowns of the hinder cheek-teeth are taller, and more distinctly crescentic, both feet are two-toed, the ulna and radius are fused, and the fibula is represented only by its lower part. In the vertebrae of the neck the distinctive cameloid characters had already made their appearance. On the other hand, the skull was short and rabbit-like, showing none of the characteristic features of modern camels.

In the Lower Miocene occurs *Protomeryx* or *Gomphotherium*, in which there is a considerable increase in the matter of bodily size, the two metacarpal and metatarsal bones (or those which unite in the latter forms to constitute the cannon-bones) being double the length of the corresponding elements in *Protylopus*. These bones, although separate, have their adjacent surfaces more closely applied than is the case in the latter; while in this and the earlier genera the terminal toe-bones indicate that the foot was of the normal hoofed type. In the skull the socket of the eye is surrounded by bone; while the dentition begins to approximate to the camel type—notably by the circumstance that the lower canine is either separated by a gap from the outermost incisors, or that its crown assumes a backwardly curved shape. In *Protolabis* of the Middle Miocene, while no cannon-bone is formed, the first and second pairs of incisor teeth are retained, and the limbs and feet are short and disproportionately small. In the Upper Miocene we come to a distinct type—*Procamelus*—which is entitled to be regarded as a camel, and approximates in size to a small llama. Here the metacarpals and metatarsals have partially united to form cannon-bones, the skull has assumed the elongated form characteristic of modern camels, with the loss of the first and second pairs of upper incisors, and the development of gaps in front of and behind each of the next three teeth, that is to say, the third incisor, the canine and the first cheek-tooth. The approximately contemporaneous *Pliauchenia* makes another step by the loss of the second lower cheek-tooth. Both these genera have the toe-bones of the irregular nodular form distinctive of modern camels, so that we may safely infer that the feet themselves had assumed the cushion-type.

In one species of *Procamelus* the metacarpals and metatarsals coalesced into canon-bones late in life; but when we come to the Pleistocene *Camelops* such union took place at an early stage of existence, and was thoroughly complete. In the living members of the group it occurs before birth. The species of *Camelops* were probably fully as large as llamas, and some, at any rate, resembled these animals as regards the number of teeth, the incisors being reduced to one upper and three lower pairs, and the cheek-teeth to four or five in the upper and four in the lower jaw; the total number of teeth thus being 28 or 30 in place of the 44 of *Pöebrotherium*. The sole difference between *Camelops* and *Llama* seems to consist in certain structural details of the lower cheek-teeth. An allied extinct genus (*Eschatius*) is also distinguished by certain features in the dentition.

Apart from *Procamelus* the foregoing genera are exclusively North American. A lower jaw from the Pleistocene deposits of that continent has, however, been referred to the Old World *Camelus*.

In addition to the above there is an extraordinary North American Miocene giraffe-necked camel (*Alticamelus*), a creature of the size of a giraffe, with similarly elongated neck and limbs, and evidently adapted for browsing on trees. The feet and number of teeth were generally similar to those of *Procamelus*. Unlike the giraffe, the length of the limbs is due to the elongation of their upper segments, and that of the neck to the lengthening of only the hinder vertebrae.

In caverns and superficial deposits of South America occur remains of extinct species more or less closely related to modern llamas; but previous to the Upper Pliocene the group is unknown in South America, which it reached from the north.

All the foregoing genera are included in the sub-family Camelidae. Parallel to this is, however, the North American family Leptomerychidae (Hypertragulidae), as represented by *Leptomeryx*, *Camelomeryx* and *Leptoreodon*, which presents remarkable resemblances, especially in the type genus, to the Tragulina (see CHEVROTAIN); camel-like features being, however, apparent in the two genera last mentioned. Generalized features are also displayed by the Oligocene *Hypisodus*, which in its short skull and large orbits presents a curious approximation to the African dik-dik antelopes of the genus *Madoqua* (see ANTELOPE). Again, the remarkable horned North American Oligocene genus *Protoceras*, while displaying resemblances to *Leptomeryx* and *Leptoreodon*, presents also points of similarity to the Tragulina and Pecora (*q.v.*).

The North American genus *Oreodon* typifies a second family included by Professor W. B. Scott in the Tylopoda and generally known as the Oreodontidae. As *Oreodon* is, however, antedated by *Merycoidodon*, the latter name is properly entitled to stand, in which case the family should be called Agriochoeridae. It is not easy to point out the characters in which the family approximates to the Camelidae, and only its general characteristics can be indicated. The family ranges in North America from the Upper Eocene to the Lower Miocene, but *Oreodon* (or *Merycoidodon*), which is typified by an animal of the size of a sheep, is Oligocene. In the Oreodontinae or typical section of the family, which includes several genera nearly allied to *Oreodon*, the skull is shorter and higher than in the camels, with a swollen brain-case, a preorbital gland-pit, the condyle of the lower jaw transversely elongated, the tympanic bulla hollow, and the orbit surrounded by bone. The dentition comprises the typical 44 teeth, of which the molars are short-crowned, with four crescentic cusps on those of the upper jaw (selenodont type). The most characteristic dental feature is, however, the assumption of the form and function of a canine by the first lower premolar; the lower canine being incisor-like. The tail is very long; and the feet have five functional toes, with complete but short metacarpals or metatarsals. In the Miocene *Agriochoerus*, which typifies a second sub-family (Agriochoerinae), there is no gland-pit in the skull, of which the orbit is open behind; while the upper incisors are wanting in the adult and the terminal toe-bones are claw-like rather than of the hoofed type. The molars are less completely selenodont than in the type genus. It is noteworthy that a molar from the Tertiary of India has been referred to *Agriochoerus*, a determination which if correct probably indicates the occurrence of Oreodonts in the unknown Tertiary deposits of Central Asia. It may be added that in the Oreodontidae the vertebral artery pierces the transverse processes of the cervical vertebrae in the normal manner.

The earliest representatives of the Tylopoda according to Professor Scott is the Middle Eocene genus *Homacodon*, typifying the family Homacodontidae, which is regarded as the common ancestor of both

Camelidae and Oreodontidae, with resemblances to the European Oligocene genus *Dichobune* (see ARTIODACTYLA). *Homacodon* was an animal of the size of a rabbit, with five toes (of which only five were functional to each foot) and 44 teeth, of which the molars are tuberculated (*bunodont*), with six columns on those of the upper jaw; the premolars being of a cutting type. It should be added that this generalized animal is not unfrequently classed among the ancestral pigs, but its cameline affinities are strongly emphasized by Professor Scott.

TYLOR, EDWARD BURNETT (1832–), English anthropologist, was born at Camberwell, London, on the 2nd of October 1832, the son of Joseph Tylor, a brassfounder. Alfred Tylor, the geologist, was an elder brother. His parents were members of the Society of Friends, at one of whose schools, at Grove House, Tottenham, he was educated. In 1848 he entered his father's manufactory in London, but at about the age of twenty he was threatened with consumption and forced to abandon business. During 1855–1856 he travelled in the United States of America to recruit his health. Proceeding in 1856 to Cuba, he met Henry Christy the ethnologist, with whom he visited Mexico. Tylor's association with Christy greatly stimulated his awakening interest in anthropology, and his visit to Mexico, with its rich prehistoric remains, led him to make a systematic study of the science. While on a visit to Cannes he wrote a record of his observations, entitled *Anahuac; or, Mexico and the Mexicans, Ancient and Modern*, which was published in 1861. In 1865 appeared *Researches into the Early History of Mankind*, which made Tylor's reputation. It showed great research, original insight, and much constructive power in the formation of systematic views. The chapters on early myths and their geographical distribution are especially valuable. The work reached a third edition in 1878. This book was followed in 1871 by the more elaborate *Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Language, Art and Custom*, which at once became the standard general treatise on anthropology. Tylor's treatment of animism (chs.xi.–xvii.) was particularly elaborate, and he first determined the limits of that province of anthropology intending it to include "the general doctrine of souls, and other spiritual beings." In 1881 Tylor published a smaller and more popular handbook on *Anthropology*. His work had already met with recognition. In 1871 he was elected F.R.S., and in 1875 received the honorary degree of D.C.L. from the university of Oxford. He was appointed keeper of the University Museum at Oxford in 1883, and reader in anthropology in 1884. In 1888 he was appointed first Gifford lecturer at Aberdeen University, and delivered a two years' course on "Natural Religion." In 1896 he became first professor of anthropology at Oxford. At the end of 1907 the Clarendon Press published a volume of *Anthropological Essays*, to which various representative scholars of a younger generation in the same field had contributed, the essays being dedicated and presented to Tylor as a mark of honour; and this collection includes not only a bibliography of his publications by Miss Freire-Marreco, but also an appreciation of Tylor's life-work by Andrew Lang.

TYMPANON, or TYMPANUM (Gr. *τύμπανον*, from *τύπτειν*, to strike), a name applied by the Romans to both kettledrum and tambourine, in the case of the latter sometimes qualified by *leve*. The *tympanum leve*, generally included among the *tympana*, described as being like a sieve, was the tambourine used in the rites of Bacchus and Cybele. Pliny doubtless described half pearls having one side round and the other flat, as *tympania*, on account of their resemblance to the tympanum or kettledrum, which, in its primitive form, innocent of screws or mechanism for tightening the head, exactly resembled the half pearl. During the middle ages the tympanum was generally a tambourine, the kettledrum being known as *nacaire*.

In architecture the term tympanum is given to the triangular space enclosed between the horizontal cornice of the entablature and the sloping cornice of the pediment. Though sometimes left plain, in the most celebrated Greek temples it was filled with sculpture of the highest standard ever attained. In Romanesque and Gothic work the term is applied to the space above the lintel or architrave of a door and the discharging arch over it, which was also enriched either with geometrical patterns or in later work with groups of figures; those in continental work are usually arranged in tiers. The upper portion of a gable when enclosed with a horizontal string-course, is also termed a tympanum.

TYNDALE (or TINDALE), **WILLIAM** (*c.* 1492–1536), translator of the New Testament and Pentateuch (see BIBLE, ENGLISH), was born on the Welsh border, probably in Gloucestershire, some time between 1490 and 1495. In Easter term 1510 he went to Oxford, where Foxe says he was entered of Magdalen Hall. He took his M.A. degree in 1515 and removed to Cambridge, where Erasmus had helped to establish a reputation for Greek and theology. Ordained to the priesthood, probably towards the close of 1521, he entered the household of Sir John Walsh, Old Sodbury, Gloucestershire, as chaplain and domestic tutor. Here he lived for two years, using his leisure in preaching in the villages and at Bristol, conduct which brought him into collision with the backward clergy of the district, and led to his being summoned before the chancellor of Worcester (William of Malvern) as a suspected heretic; but he was allowed to depart without receiving censure or giving any undertaking. But the persecution of the clergy led him to seek an antidote for what he regarded as the corruption of the Church, and he resolved to translate the New Testament into the vernacular. In this he hoped to get help from Cuthbert Tunstall, bishop of London, and so "with the good will of his master" he left Gloucester in the summer of 1523. Tunstall disappointed him, so he got employment as a preacher at St Dunstan's-in-the-West, and worked at his translation, living as chaplain in the house of Humphrey Monmouth, an alderman, and forming a firm friendship with John Frith; but finding publication impossible in England, he sailed for Hamburg in May 1524. After visiting Luther at Wittenberg, he settled with his amanuensis William Roy in Cologne, where he had made some progress in printing a 4to edition of his New Testament, when the work was discovered by John Cochlaeus, dean at Frankfurt, who not only got the senate of Cologne to interdict further printing, but warned Henry VIII. and Wolsey to watch the English ports. Tyndale and Roy escaped with their sheets to Worms, where the 8vo edition was completed in 1526. Copies were smuggled into England but were suppressed by the bishops, and William Warham, archbishop of Canterbury, even bought up copies on the Continent to destroy them. Attempts were made to seize Tyndale at Worms, but he found refuge at Marburg with Philip, landgrave of Hesse. There he probably met Patrick Hamilton, and was joined by John Frith. About this time he changed his views on the Eucharist and swung clean over from transubstantiation to the advanced Zwinglian position. His *Parable of the Wicked Mammon* (1528), *Obedience of a Christen Man* (1528), in which the two great principles of the English Reformation are set out, viz. the authority of Scripture in the Church and the supremacy of the king in the state, and *Practyse of Prelates* (1530), a strong indictment of the Roman Church and also of Henry VIII.'s divorce proceedings, were all printed at Marburg. In 1529 on his way to Hamburg he was wrecked on the Dutch coast, and lost his newly completed translation of Deuteronomy. Later in the year he went to Antwerp where he conducted his share of the classic controversy with Sir Thomas More. After Henry VIII.'s change of attitude towards Rome, Stephen Vaughan, the English envoy to the Netherlands, suggested Tyndale's return, but the reformer feared ecclesiastical hostility and declined. Henry then demanded his surrender from the emperor as one who was spreading sedition in England, and Tyndale left Antwerp for two years, returning in 1533 and busying himself with revising his translations. In May 1535 he was betrayed by Henry Phillips, to whom he had shown much kindness, as a professing student of the new faith. The imperial officers imprisoned him at Vilvorde Castle, the state prison, 6 m. from Brussels, where in spite of the great efforts of the English merchants and the appeal of Thomas Cromwell to Archbishop Carandolet, president of the council, and to the governor of the castle, he was tried for heresy and condemned. On the 6th of October 1536 he was strangled at the stake and his body afterwards burnt. Though long an exile from his native land, Tyndale was one of the greatest forces of the English Reformation. His writings show sound scholarship and high literary power, while they helped to shape the thought of the Puritan party in England. His translation of the Bible was so sure and happy that it formed the basis of subsequent renderings, especially that of the authorized version of 1611. Besides the New Testament, the Pentateuch and Jonah, it is believed that he finished in prison the section of the Old Testament extending from Joshua to Chronicles.

Beside the works already named Tyndale wrote *A Prologue on the Epistle to the Romans* (1526), *An Exposition of the 1st Epistle of John* (1531), *An Exposition of Matthew v.–vii.* (1532), a treatise on the sacraments (1533), and possibly another (no longer extant) on matrimony (1529).

The works of Tyndale were first published along with those of John Frith (*q.v.*) and Robert Barnes, "three worthy martyrs and principal teachers of the Church of England," by John Day, in 1573 (folio). A new edition of the works of Tyndale and Frith, by T. Russell, was published at London (1828–1831). *His Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* were published by the Parker Society in 1848. For biography, see Foxe's *Acts and Monuments*; R. Demaus, *William Tyndale* (London, 1871); also the Introduction to Mombert's critical reprint of Tyndale's Pentateuch (New York, 1884), where a bibliography is given.

TYNDALL, JOHN (1820–1893), British natural philosopher, was born in Co. Carlow, Ireland, on the 2nd of August 1820, his father being the son of a small landowner in poor circumstances, but a man of more than ordinary ability. With Darwin and Huxley his name is inseparably connected with the battle which began in the middle of the 19th century for making the new standpoint of modern science part of the accepted philosophy in general life. For many years, indeed, he came to represent to ordinary Englishmen the typical or ideal professor of physics. His strong, picturesque mode of seizing and expressing things gave him an immense living influence both in speech and writing, and disseminated a popular knowledge of physical science such as had not previously existed. But besides being a true educator, and perhaps the greatest popular teacher of natural philosophy in his generation, he was an earnest and original observer and explorer of nature.

Tyndall was to a large extent a self-made man; he had no early advantages, but with indomitable earnestness devoted himself to study, to which he was stimulated by the writings of Carlyle. He passed from a national school in Co. Carlow to a minor post (1839) in the Irish ordnance survey, thence (1842) to the English survey, attending mechanics' institute lectures at Preston in Lancashire. He then became for a time (1844) a railway engineer, and in 1847 a teacher at Queenwood College, Hants. Thence with much spirit, and in face of many difficulties, he betook himself, with his colleague Edward Frankland, to the university of Marburg (1848–1851), where, by intense application, he obtained his doctorate in two years. His inaugural dissertation was an essay on screw-surfaces.

Tyndall's first original work in physical science was in his experiments with regard to magnetism and diamagnetic polarity, on which he was chiefly occupied from 1850 to 1855. While he was still lecturing on natural philosophy at Queenwood College, his magnetic investigations made him known in the higher circles of the scientific world, and through the initiative of Sir E. Sabine, treasurer of the Royal Society, he was elected F.R.S. in June 1852. In 1850 he had made Faraday's acquaintance, and shortly before the Ipswich meeting of the British Association in 1851 he began a lasting friendship with T. H. Huxley. The two young men stood for chairs of physics and natural history respectively, first at Toronto, next at Sydney, but they were in each case unsuccessful. On the 11th of February 1853, however, Tyndall gave, by invitation, a Friday evening lecture (on "The Influence of Material Aggregation upon the Manifestations of Force") at the Royal Institution, and his public reputation was at once established. In the following May he was chosen professor of natural philosophy at the Royal Institution, a post which exactly suited his striking gifts and made him a colleague of Faraday, whom in 1866 he succeeded as scientific adviser to the Trinity House and Board of Trade, and in 1867 as superintendent of the Royal Institution. His reverent attachment to Faraday is beautifully manifested in his memorial volume called *Faraday as a Discoverer* (1868).

The more original contributions which Tyndall made to science are dealt with elsewhere, in the articles concerned with the various subjects (see HEAT, &c.). But his inquiries into glacier motion were notable alike for his association with Switzerland and for prolonged controversy with other men of science on the subject. In 1854, after the meeting of the British Association in Liverpool, a memorable visit occurred to the Penrhyn slate quarries, where the question of slaty cleavage arose in his mind, and ultimately led him, with Huxley, to Switzerland to study the phenomena of glaciers. Here the mountains seized him, and he became a constant visitor and one of the most intrepid and most resolute of explorers; among other feats of climbing he was the first to ascend the Weisshorn (1861). The strong, vigorous, healthfulness and enjoyment which permeate the record of his Alpine work are magnificent, and traces of his influence remain in Switzerland to this day. The problem of the flow of glaciers occupied his attention for years, and his views brought him into acute conflict with others, particularly J. D. Forbes and James Thomson. Every one knew that glaciers moved, but the questions were how they moved, for what reason and by what mechanism. Some thought they slid like solids; others that they flowed like liquids; others that they crawled by alternate expansion and contraction, or by alternate freezing and melting; others, again, that they broke and mended. Thus there arose a chaos of controversy, illuminated by definite measurements and observations. Tyndall's own summary of the course of research on the subject was as follows:—

> The *idea* of semi-fluid motion belongs entirely to Rendu; the *proof* of the quicker central flow belongs in part to Rendu, but almost wholly to Agassiz and Forbes; the proof of the retardation of the bed belongs to Forbes alone; while the discovery of the locus of the point of maximum motion belongs, I suppose, to me.

But while Forbes asserted that ice was viscous, Tyndall denied it, and insisted, as the result of his observations, on the flow being due to fracture and regelation. All agreed that ice flowed *as if* it were a viscous fluid; and of this apparent viscosity James Thomson offered an independent explanation by the application of pure thermodynamical theory, which Tyndall considered inefficient to account for the facts he observed. It is unnecessary here to rake among the ashes of this prolonged dispute, but it may be noted that Helmholtz, who, in his lecture on "Ice and Glaciers," adopted Thomson's theory, afterwards added in an appendix that he had come to the conclusion that Tyndall had "assigned the essential and principal cause of glacier motion in referring it to fracture and regelation" (1865).

Tyndall's investigations of the transparency and opacity of gases and vapours for radiant heat, which occupied him during many years (1859–1871), are frequently considered his chief scientific work. But his activities were essentially many-sided. He definitely established the absorptive power of clear aqueous vapour—a point of great meteorological significance. He made brilliant experiments elucidating the blue of the sky, and discovered the precipitation of organic vapours by means of light. He called attention to curious phenomena occurring in the track of a luminous beam. He examined the opacity of the air for sound in connexion with lighthouse and siren work, and he finally clinched the proof of what had been already substantially demonstrated by several others, viz. that germ-free air did not initiate putrefaction, and that accordingly "spontaneous generation" as ordinarily understood was a chimera (1875–1876). One practical outcome of these researches is the method now always adopted of sterilizing by a succession of gentle warmings, sufficient to kill the developed micro-organisms, instead of by one fierce heating attempting to attack the more refractory undeveloped germs of the same. This method of intermittent sterilization originated with Tyndall, and it was an important contribution to biological science and industrial practice.

For the substantial publication of these researches reference must be made to the *Transactions of the Royal Society*; but an account of many of them was incorporated in his best-known books, namely, the famous *Heat as a Mode of Motion* (1863; and later editions to 1880), the first popular exposition of the mechanical theory of heat, which in 1862 had not reached the textbooks; *The Forms of Water*, &c. (1872); *Lectures on Light* (1873); *Floating Matter in the Air* (1881); *On Sound* (1867; revised 1875, 1883, 1893). The original memoirs themselves on radiant heat and on magnetism were collected and issued as two large volumes under the following titles: *Diamagnetism and Magne-crystallic Action* (1870); *Contributions to Molecular Physics in the Domain of Radiant Heat* (1872).

It was on the whole the personality, however, rather than the discoverer, that was greatest in Tyndall. In the pursuit of pure science for its own sake, undisturbed by sordid considerations, he shone as a beacon light to younger men—an exemplar of simple tastes, robust nature and lofty aspirations. His elevation above the common run of men was conspicuous in his treatment of the money which came to him in connexion with his successful lecturing tour in America (1872–1873). It amounted to several thousands of pounds, but he would touch none of it; he placed it in the hands of trustees for the benefit of American science—an act of lavishness which bespeaks a noble nature. Though not so prominent as Huxley in detailed controversy over theological problems, he played an important part in educating the public mind in the attitude which the development of natural philosophy entailed towards dogma and religious authority. His famous Belfast address (1874), delivered as president of the British Association, made a great stir among those who were then busy with the supposed conflict between science and religion; and in his occasional writings—*Fragments of Science*, as he called them, "for unscientific people"—he touched on current conceptions of prayer, miracles, &c., with characteristic straightforwardness and vigour.

As a public speaker he had an inborn Irish readiness and vehemence of expression; and, though a thorough Liberal, he split from Mr Gladstone on Irish home rule, and took an active part in politics in opposing it.

In 1876 Tyndall married Louisa, daughter of Lord Claud Hamilton. He built in 1877 a cottage on Bel Alp above the Rhône valley, and in 1885 a house on Hindhead, near Haslemere. At the latter place he spent most of his later years; his health was, however, no longer as vigorous as his brain, and he suffered frequently from sleeplessness. On the 4th of December 1893, having been accidentally given an overdose of chloral, he died at Hindhead.

TYNDARIS, an ancient city on the northern coast of Sicily, about 13 m. W.S.W. of Mylae (mod. Milazzo) and 5 m. E. of the modern town of Patti. It was founded by Dionysius the Elder in 395 B.C., who settled there 600 Peloponnesian Messenians on a site cut out of the territory of Abacaenum (1 m. north of the modern Tripi). It was thus almost the last Greek city founded in Sicily. It was one of the earliest allies of Timoleon. In the First Punic War it was dependent on Carthage, but expelled the garrison in 254 B.C. and joined the Romans, under whom it seems to have flourished. Cicero calls it "nobilissima civitas," though it seems to have suffered especially under Verres. It was one of the points occupied by Sextus Pompeius, but was later on taken by Agrippa, who used it as a base of operations. Augustus probably made it a *colonia*. Pliny mentions that half of it was swallowed up by the sea, though he does not give the date of this event (*Hist. nat.* ii. 206). It was probably, however, due to a fault in the limestone rock of which it is composed, and the action of the sea. The site is a remarkably fine one, and it is surprising that it was not occupied sooner. It is an isolated hill (920 ft.) with projecting spurs, rising abruptly on the seaward side, and connected by a comparatively narrow isthmus with the lower ground inland. It thus commands a magnificent view, including even the summit of Etna, while opposite to it on the north are the Lipari Islands. Considerable remains of the city walls, built of rectangular blocks of stone, exist on the south side; on the west their foundations are traceable. Remains of several towers may be seen, and the site of the main gate, which was in a recess on the south (the land) side, is clearly traceable, the walls defending it on each side being well preserved. Outside it are several tombs of the Roman period. The walls follow the upper edge of the plateau, and do not seem to have included the spurs to seaward. Their remains indicate that it was the north and north-east portion of the city that fell. This fact renders it doubtful whether the church of the Madonna di Tindari, at the east extremity, marks the site of the acropolis. Along parts of the north side, where the line of the wall should run, is a line of débris, which may belong to a reconstruction after the catastrophe described by Pliny. Within the walls are considerable remains of a building generally known (though not correctly) as the gymnasium, constructed of masonry, with three narrow halls, each about 90 ft. long, the central hall being 21 ft. wide, the other two 14 ft. Below it to the north are remains of a building with several mosaic pavements, and to the west is a small theatre, the internal diameter of which is 212 ft., and the length of the stage 80 ft. There are traces of many other buildings within the city area, including a considerable number of underground cisterns An important collection of objects found on the site is preserved in the Villa della Scala ($1\frac{1}{2}$ m. to the west), belonging to Baron Sciacca, the owner of the site itself.

See R. V. Scaffidi, *Tyndaris* (Palermo, 1895). (T. As.)

TYNE, a river in the north-east of England, flowing eastward to the North Sea, formed of two main branches, the North Tyne and South Tyne. The North Tyne rises in the Cheviot Hills, at their south-western extremity, near the Scottish border. The valley soon becomes beautifully wooded. At Bellingham it receives the Rede, whose wild valley, Redesdale, was one of the chief localities of border warfare, and contains the site of the battle of Otterburn (1388). The South Tyne rises in the south-eastern extremity of Cumberland, below Cross Fell in the Pennine Chain, and flows north past Alston as far as the small town of Haltwhistle, where it turns east. The valley receives from the south the picturesque Allendale, in which the lead mines were formerly important. The two branches of the Tyne join at Warden, a little above the town of Hexham, with its great abbey, and the united stream continues past Corbridge, where a Roman road crossed it, in a beautiful sylvan valley. The united course from the junction to the sea is about 30 m. The length from the source of the North Tyne is 80 m., and the drainage area is 1130 sq. m. In its last 15 m. the Tyne, here the boundary between Northumberland and Durham, is one of the most important commercial waterways in England. Sea-going vessels can navigate up to Blaydon, and collieries and large manufacturing towns line the banks—Newburn, Newcastle-upon-Tyne, Wallsend and North Shields on the Northumberland side; Gateshead, Jarrow and South Shields on the Durham side, with many lesser centres, forming continuous lines of factories and shipbuilding yards. The growth of the great shipbuilding and engineering companies, now amalgamated, of which the Armstrong firm at Elswick is the most famous, necessitated the dredging of the river so as to form a deep waterway. At high-water spring tides there are 40 ft. of water at Shields Harbour at the mouth, and 31 at Newcastle, 8 m. up river. Dangerous rocks outside the mouth have been partially removed and the remainder protected, and the Tyne forms a very safe harbour of refuge.

TYNEMOUTH, a municipal, county and parliamentary borough of Northumberland, England, including the townships of Chirton, Cullercoats, North Shields, Preston and Tynemouth. Pop. (1891), 46,588; (1901), 51,366. North Shields, Tynemouth and Cullercoats are successive stations on a branch of the North-Eastern railway. Tynemouth lies on the north bank of the Tyne, on a picturesque promontory, 8½ m. E. of Newcastle. North Shields (*q.v.*) adjoins it on the W.; Chirton is to the W. again, and Preston to the N. of North Shields, while Cullercoats is on the coast 1¼ m. N.N.W. of Tynemouth. Tynemouth is the principal watering-place on this part of the coast, and here and at Cullercoats are numerous private residences. On the point of the promontory there is a small battery called the Spanish battery, and near it is a monument to Lord Collingwood. Within the grounds, to which the gateway of the old castle gives entrance, are the ruins of the ancient priory of St Mary and St Oswin—the principal remains being those of the church, which was a magnificent example of Early English work engrafted upon Norman. The priory and castle serve as the headquarters of the Tyne Submarine Engineers. The municipal buildings are in North Shields, which is also an important seaport. The coast is rocky and dangerous, but a fine pier protects the harbour (see NORTH SHIELDS). The municipal borough is under a mayor, 6 aldermen and 18 councillors. Area, 4372 acres.

Tynemouth is supposed to have been a Roman station, from the discovery of Roman remains there, but its early history centres round the priory, supposed to have been founded by Edwin, king of Northumbria, between 617 and 633, and rebuilt by king Oswald in 634. In 651 it became famous as the burial-place of Oswin, king of Deira, afterwards patron saint of the priory. After the conquest Malcolm, king of Scotland, and Edward his son, who had been defeated and killed at Alnwick, were buried there. Earl Waltheof gave Tynemouth to the monks of Jarrow, and it became a cell to the church of Durham, but later, owing to a quarrel with the bishop, Robert de Mowbray granted it to the abbey of St Albans in Hertfordshire. The priory was probably fortified in Saxon times, and was strengthened by Robert de Mowbray so that it was able to sustain a siege of two months by William Rufus. After the Dissolution the fortifications were repaired by Henry VIII. In 1642 it was garrisoned for the king by the earl of Newcastle, but surrendered to parliament in 1644. It was converted into barracks at the end of the 18th century. Owing to their close proximity to Newcastle and to the ascendancy which the burgesses of that town had gained over the river Tyne, Tynemouth and North Shields did not become important until the 19th century; the privileges which they held before that time are contained in charters to the prior and convent, and include freedom from toll, &c., granted by King John in 1203–1204. In 1292 there were disputes between the citizens of Newcastle and the prior, who had built a quay at North Shields, but was obliged by act of parliament to destroy it. Edward IV. in 1463 confirmed the previous charters of the monks, and at the same time gave them and their tenants licence to buy necessaries from ships in the "port and river of Tyne," and to load ships with coal and salt "without hindrance from the men of Newcastle." After the Napoleonic wars the trade of North Shields rapidly increased. The borough was incorporated in 1849, and has returned one member to parliament since 1832. In 1279 the prior claimed a market at Tynemouth, but was not allowed to hold it; and in 1304 a fair, which had been granted to him in the preceding year, was withdrawn on the petition of the burgesses of Newcastle. A market and two fairs on the last Friday in April and the first Friday in November were established in 1802 by the duke of Northumberland. In the 17th century the chief industries were the salt and coal trades. The former, which has entirely disappeared, was the more important, and in 1635 the salt-makers of North and South Shields received an incorporation charter.

TYPEWRITER, a writing machine which produces characters resembling those of ordinary letterpress; the term is also applied to the operator who works such machines.

In 1714 a British patent was granted to Henry Mill, who claimed that he had brought his invention to perfection at great pains and expense, for "An Artificial Machine or Method for the Impressing or Transcribing Letters, Singly or Progressively one after another as in Writing, whereby all Writing whatever may be Engrossed in Paper or Parchment so Neat and Exact as not to be distinguished from Print"; but beyond the title the patent gives no indication of the nature or construction of the machine. In America a patent for a "typographer" was obtained by William A. Burt in 1829, but the records of it were destroyed by a fire at Washington in 1836. The "typographic machine or pen" patented by X. Progrin, of Marseilles, in 1833, was on the type-bar principle, and at the York meeting of the British Association in 1844 a Mr Littledale showed an apparatus for the use of the blind, by which the impression of a type selected from a series contained in a slide could be embossed on a sheet of paper. In the "chirographer," for which American patents were granted to Charles Thurber in 1843 and 1845, a horizontal wheel carried in its periphery a series of rods each bearing a letter, the wheel being rotated till the required type was over the printing point. The Great Exhibition of 1851 contained a machine patented by Pierre Foucault, of Paris, in 1849, in which a series of rods with type at their ends could be pushed down to emboss paper at the printing point to which they were arranged radially; and there was in addition the "typograph" of William Hughes, which was also intended for embossing, though it was subsequently modified to give an impression through carbon paper. Between 1847 and 1856 Alfred E. Beach in America, and between 1855 and 1860 Sir Charles Wheatstone in England, constructed several typewriters, and in 1857 Dr S. W. Francis, of New York, made one with a pianoforte keyboard and type bars arranged in a circle. In 1866 John Pratt, an American living in London, patented a machine having 36 types mounted in three rows on a type wheel, the rotation of which brought the required character opposite the printing point, when the paper with a carbon sheet intervening was pressed against it by a hammer worked by the keys. Two years later an American patent was taken out by C. L. Sholes and C. Glidden, and in 1875, after effecting various improvements, they finally placed the manufacture of their machines in the hands of Messrs E. Remington & Sons, gunmakers, of Ilion, New York. The Remington machines worked on the type-bar principle, but at first each of the 44 bars carried only a single character, so that the writing was in capitals only. But in 1878 type-bars with two types were introduced, so that a machine with 40 keys, two being change-case keys, could print 76 characters, with both capital and small letters.

The great majority of modern typewriters are worked from a keyboard; the few that are not, known as index machines, will be disregarded here, for although they are much less expensive in first cost than the others, they scarcely come into competition as practical instruments, on account of their slowness. Keyboard machines fall into two classes, according as the types which make the impressions are (*a*) carried at the end of levers or type-bars which strike the paper when the keys are depressed, or (*b*) are arranged round the circumference of a wheel, or segment, which is rotated by the action of the keys until the corresponding type is brought opposite the printing point. The former of these arrangements is the more common. Another point of difference is in the inking device; in some cases, the type is inked by means of an ink-pad before being brought down on the paper to make the impression, but more frequently an inked ribbon is drawn along by the action of the machine between the type-face and the paper. Sometimes this ribbon is inked in two colours, enabling the operator, by bringing the appropriate portion opposite the type-face, to write, say, in black and red at will. A third basis of classification may be found in the arrangement of the keyboard. In some machines there is one key for each character, in others each key does duty for two or more characters. For example, in the former class there is one key for the capital A and another for the small a, the keys being arranged in two banks corresponding to the upper and lower cases of a printer's type-case; in the latter, one key is capable of striking both the small and the capital letter, and it does one or other according as a subsidiary key is or is not brought into simultaneous use with it. In type-bar machines designed on this plan, each bar carries two or more letters (cf. fig. 1). This form of keyboard is also applied to type-wheel machines.

Though there are numberless differences in detail, all typewriters, apart from the index machines, bear a general resemblance to each other in their mechanical arrangements. The really essential operations may be reduced to two; the machine must print a letter when a key is struck, and it must have a device by which the paper may be moved a short distance to the left with each stroke in order that the letters may be printed separately, not one on top of the other. Of the many subsidiary appliances that are fitted—a bell to warn the operator that he is approaching the end of a line, a lock to prevent the machine from working after the end of the line has been passed, attachments for facilitating insertion of fresh paper, corrections, and tabulation, &c.—some are certainly of advantage, but others are more useful to the manufacturer in drawing up his advertisements than to the expert operator, whose first care often is to disconnect them from the machine. Similarly with the "visible writing," which is sometimes put forward as a recommendation of extraordinary importance; doubtless the novice who is learning the keyboard finds a natural satisfaction in being able to see at a glance that he has struck the key he was aiming at, but to the practised operator it is not a matter of great moment whether the writing is always in view or whether it is only to be seen by moving the carriage, for he should as little need to test the accuracy of his performance by constant inspection as the piano-player needs to look at the notes to discover whether he has struck the right ones. The one important desideratum, without which no typewriter can produce work of satisfactory appearance, is accuracy of alignment. For the attainment of this the use of type-bars has given wide scope to the ingenuity of inventors, who have been confronted with the problem of making a system of levers at once strong, rigid and light, and of supporting them on bearings which are steady and adjustable for wear in conditions where space is much restricted.

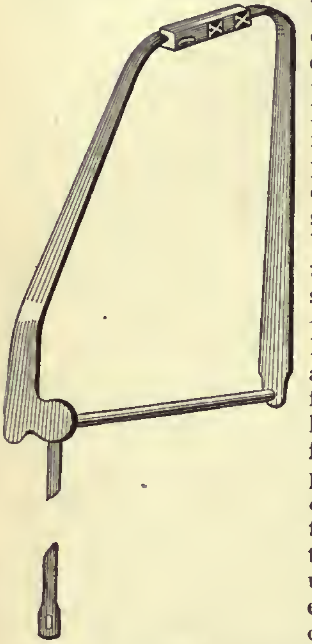

FIG. 1.—Type-bar of Oliver Machine.

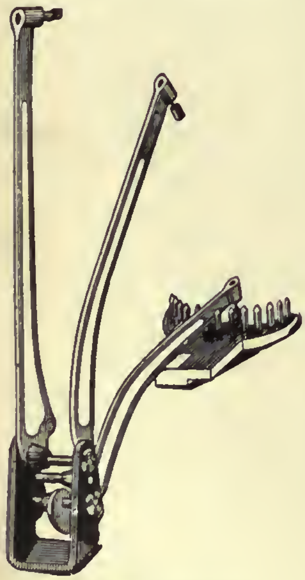

FIG. 2.—Type-bars of Bar-Lock Machine.

In the Oliver machine the type-bar is of the form shown in fig. 1, to secure stiffness and a double bearing. In the Bar-Lock, the type-bars are arranged three in one hanger, so that each has a bearing three times as wide as would be possible in the same space if each had a hanger to itself (fig. 2); in addition the wear of the pivots can be taken up by the screws seen on the right of the bearings, and as a further precaution each type-bar is locked at the printing point by falling between a pair of conical pins, which centre it exactly in the required place. In the Yost and the Empire the type-bars pass through guides. The centre guide of the former is shown at G in fig. 3, the type being just about to strike the paper. Pressure on one of the keys works the lever and pushes up the connecting-rod C, when the type leaves the ink-pad P and passes through the guide, which is slightly bevelled so as to guide it exactly to the printing point. In the Smith Premier the shafts upon which the type-bars swing are mounted tangentially on the ring (fig. 4), so that long supporting bearings are obtained, while the shortness of the type-bars themselves renders it possible to make them very stiff.

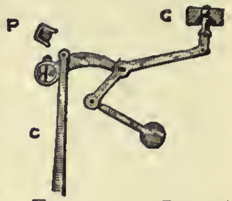

FIG. 3. — Central Guide and Type-bar of Yost Machine.

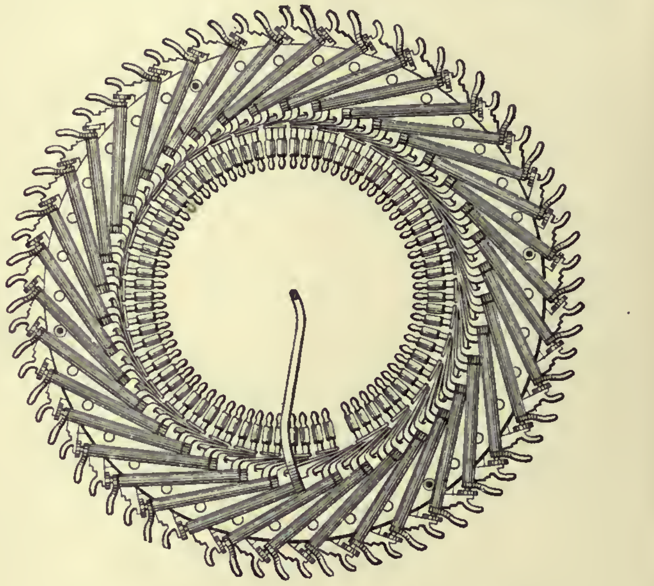

FIG. 4.—Type-bar Bearings, Smith Premier.

The rocking-shaft mechanism (fig. 5), by which the power is transmitted from the keys to the type-bars, admits of each key having the same leverage and tends to uniformity of touch. This last quality is also aimed at by interposing an intermediate parallel bar between the key levers and the type-bar, as in the New Century Caligraph. In the Densmore the friction of the movements is minimized by the employment of ball bearings for the type-bar pivots. Electrical typewriters, in which the depression of a key does not work a type-bar directly, but merely closes a circuit that energizes an electromagnet, have been suggested as a means of obtaining uniformity of touch combined with ease and rapidity, but have not as yet displaced the ordinary machines to any extent.

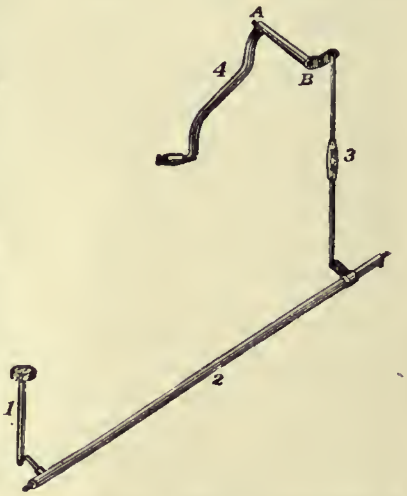

FIG. 5.—Rocking-shaft Mechanism of Smith Premier.

1, Key with stem. 2, Rocking shaft.
3, Connecting-rod. 4, Type-bar.
A and B, Conical bearings, $1\frac{5}{8}$ in. apart.

One special form of typewriter, the Elliott-Fisher, is designed to write in a book such as a ledger. One leaf is clamped between the platen and an open frame which holds the paper smoothly. The operative parts slide on this frame, and move up and down the page so as to space the lines properly, the keyboard, with the type-bars, ribbon, &c., travelling step by step across the page. An adding device may be combined with this machine.

TYPHOID FEVER. Typhoid or enteric[1] (Gr. ἔντερον, the intestine) is a specific infectious fever characterized mainly by its insidious onset, by a peculiar course of the temperature, by marked abdominal symptoms occurring in connexion with a specific lesion of the bowels, by an eruption upon the skin, by its uncertain duration, and by a liability to relapses. This fever has received various names, such as gastric fever, abdominal typhus, infantile remittent fever, slow fever, nervous fever, "pythogenic fever," &c. The name of "typhoid" was given by Louis in 1829, as a derivative from typhus. Until a comparatively recent period typhoid was not distinguished from typhus. For, although it had been noticed that the course of the disease and its morbid anatomy were different from those of ordinary cases of typhus, it was believed that they merely represented a variety of that malady. The distinction between the two diseases appears to have been first accurately made in 1836 by Messrs Gerhard and Pennock, of Philadelphia, and valuable work was done by other American doctors, particularly Elisha Bartlett (1842). The difference between typhus and typhoid was still more fully demonstrated by Dr A. P. Stewart, of Glasgow (afterwards of London). Finally, all doubt upon the subject was removed by the careful clinical and pathological observations made by Sir William Jenner at the London fever hospital (1849-1851).

The more important phenomena of typhoid fever will be better understood by a brief reference to the principal pathological changes which take place during the disease. These relate for the most part to the intestines, in which the morbid processes are highly characteristic, both as to their nature and their locality. The changes (to be presently specified) are evidently the result of the action of the contagium on the system, and they begin to show themselves from the very commencement of the fever, passing through various stages during its continuance. The portion of the bowels in which they occur most abundantly is the lower part of the small intestine (ileum), where the "solitary glands" and "Peyer's patches" on the mucous surface of the canal become affected by diseased action of a definite and progressive character, which stands in distinct relation to the symptoms exhibited by the patient in the course of the fever. (1) These glands, which in health are comparatively indistinct, become in the commencement of the fever enlarged and prominent by infiltration due to inflammatory action in their substance, and consequent cell proliferation. This change usually affects a large extent of the ileum, but is more marked in the lower portion near the ileo-caecal valve. It is generally held that this is the condition of the parts during the first eight or ten days of the fever. (2) These enlarged glands next undergo a process of sloughing, the inflammatory products being cast off either in fragments or *en masse*. This usually takes place in the second week of the fever. (3) Ulcers are thus formed varying in size according to the gland masses which have sloughed away. They may be few or many in number, and they exhibit certain characteristic appearances. They are frequently, but not always, oblong in shape, with their long axis in that of the bowel, and they have somewhat thin and ragged edges. They may extend through the thickness of the intestine to the peritoneal coat and in their progress erode blood-vessels or perforate the bowel. This stage of ulceration exists from the second week onwards during the remaining period of the fever, and even into the stage of convalescence. (4) In most instances these ulcers heal by cicatrization, leaving, however, no contraction of the calibre of the bowel. This stage of healing occupies a considerable time, since the process does not advance at an equal rate in the case of all the ulcers, some of which have been later in forming than others. Even when convalescence has been apparently completed, some unhealed ulcers may yet remain and prove, particularly in connexion with errors in diet, a cause of relapse of some of the symptoms, and even of still more serious or fatal consequences. The mesenteric glands external to, but in functional relation with, the intestine, become enlarged during the progress of the fever, but usually subside after recovery.

Besides these changes, which are well recognized, others more or less important are often present. Among these may be mentioned marked atrophy, thinning and softness of the coats of the intestines, even after the ulcers have healed—a condition which may not improbably be the cause of that long-continued impairment of the function of the bowels so often complained of by persons who have passed through an attack of typhoid fever. Other changes common to most fevers are also to be observed, such as softening of the muscular tissues generally, and particularly of the heart, and evidences of complications affecting chest or other organs, which not infrequently arise. The swelled leg of fever sometimes follows typhoid, as does also periosteal inflammation.

The symptoms characterizing the onset of typhoid fever are very much less marked than those of most other fevers. The most marked of the early symptoms are headache, lassitude and discomfort, together with sleeplessness and feverishness, particularly at night; this last symptom is that by which the disease is most readily detected in its early stages. The peculiar course of the temperature is also one of the most important diagnostic evidences of this fever. During the first week it has a morning range of moderate febrile rise, but in the evening there is a marked ascent, with a fall again towards morning, each morning and evening, however, showing respectively a higher point than that of the previous day, until about the eighth day, when in an average case the highest point is attained. This varies according to the severity of the attack; but it is no unusual thing to register 104° or 105° F. in the evening and 103° or 104° in the morning. During the second week the daily range of temperature is comparatively small, a slight morning remission being all that is observed. In the third week the same condition continues more or less; but frequently a slight tendency to lowering may be discerned, particularly in the morning temperature, and the febrile action gradually dies down as a rule between the twenty-first and the twenty-eighth days, although it is liable to recur in the form of a relapse. Although the patient may, during the earlier days of the fever, be able to move about, he feels languid and uneasy; and usually before the first week is over he has to take to bed. He is restless, hot and uncomfortable, particularly as the day advances, and his cheeks show a red flush, especially in the evening or after taking food. The aspect, however, is different from the oppressed, stupid look which is present in typhus. The pulse in an ordinary case, although more rapid than normal, is not accelerated to an extent corresponding to the height of the temperature, and is, at least in the earlier stages of the fever, rarely above 100. In severe and protracted cases, where there is evidence of extensive intestinal ulceration, the pulse becomes rapid and weak, with a dicrotic character indicative of cardiac feebleness. The tongue has at first a thin, whitish fur and is red at the tip, edges and central line. It tends, however, to become dry, brown or glazed looking, and fissured transversely, while sordes may be present about the lips and teeth. There is much thirst and in some cases vomiting. Splenic and hepatic enlargement may be made out. From an early period in the disease abdominal symptoms show themselves and are frequently of highly diagnostic significance. The abdomen is somewhat distended or tumid, and pain accompanying some gurgling sounds may be elicited on light pressure about the lower part of the right side close to the groin—the region corresponding to that portion of the intestine in which the morbid changes already referred to are progressing. Diarrhoea is a frequent but by no means constant symptom. When present it may be slight in amount, or, on the other hand, extremely profuse, and it corresponds, as a rule, to the severity of the intestinal ulceration. The discharges are highly characteristic, being of light yellow colour resembling pea soup in appearance. Should intestinal haemorrhage occur, as is not infrequently the case during some stage of the fever, they may be dark brown or composed entirely of blood. The urine is scanty and high-coloured. About the beginning, or during the course of the second week of the fever, an eruption frequently makes its appearance on the skin. It consists of isolated spots, oval or round in shape, of a pale pink or rose colour, and of about one to one and a half lines in diameter. They are seen chiefly upon the abdomen, chest and back, and they come out in crops, which continue for four or five days and then fade away. At first they are slightly elevated, and disappear on pressure. In some cases they are very few in number, and their presence is made out with difficulty; but in others they are numerous and sometimes show themselves upon the limbs as well as upon the body. They do not appear to have any relation to the severity of the attack, and in a very considerable proportion of cases (particularly in children) they are entirely absent. Besides this eruption there are not infrequently numerous very faint bluish patches or blotches about half an inch in diameter, chiefly upon the body and thighs. When present the rose-coloured spots continue to come out in crops till nearly the end of the fever, and they may reappear should a relapse

[1] The word "enteric" has been substituted for "typhoid" by the Royal College of Physicians in the nomenclature of diseases authorized by them, and the change was officially adopted by all departments of the British government. Its advantages are doubtful, and it has been generally ignored by those foreign countries which used the word "typhoid." "Enteric" is preferable in that it cannot be confounded with "typhus" and bears some relation to the nature of the affection, the characteristic feature of which is a specific inflammation of the small intestine; but it is not sufficiently distinctive. There are, in truth, several enteric fevers, and the appropriation of a term having a general meaning to one of them is inconvenient. Thus it is found necessary to revert to the discarded "typhoid," which has no real meaning in itself, but is convenient as a distinctive label, when speaking of the cause of the disease or some of its symptoms. We have the "typhoid bacillus," "typhoid stools," "typhoid spots", "typhoid ulcers," &c. The word "enteric" cannot well be applied to these things, because of its general meaning. Consequently both words have to be used, which is awkward and confusing.

subsequently occur. These various symptoms persist throughout the third week, usually, however, increasing in intensity. The patient becomes prostrate and emaciated; the tongue is dry and brown, the pulse quickened and feeble, and the abdominal symptoms more marked; while nervous disturbance is exhibited in delirium, in tremors and jerkings of the muscles (*subsultus tendinum*), in drowsiness, and occasionally in "coma vigil." In severe cases the exhaustion reaches an extreme degree, although even in such instances the condition is not to be regarded as hopeless In favourable cases a change for the better may be anticipated between the twenty-first and twenty-eighth days, more usually the latter. It does not, however, take place as in typhus by a well-marked crisis, but rather by what is termed a "lysis" or gradual subsidence of the febrile symptoms, especially noticeable in the daily decline of both morning and evening temperature, the lessening of diarrhoea, and improvement in pulse, tongue, &c. Convalescence proceeds slowly and is apt to be interrupted by relapses. Should such relapses repeat themselves, the case may be protracted for two or three months, but this is comparatively rare.

Death in typhoid fever usually takes place from one or other of the following causes. (1) Exhaustion, in the second or third weeks, or later. Sometimes sinking is sudden, partaking of some of the characters of a collapse. (2) Haemorrhage from the intestines. The evidence of this is exhibited not only in the evacuations, but in the sudden fall of temperature and rise in pulse-rate, together with great pallor, faintness and rapid sinking. Sometimes haemorrhage, to a dangerous and even fatal extent, takes place from the nose. (3) Perforation of an intestinal ulcer. This gives rise, as a rule, to sudden and intense abdominal pain, together with vomiting and signs of collapse, viz. a rapid flickering pulse, cold clammy skin, and the marked fall of temperature. Symptoms of peritonitis quickly supervene and add to the patient's distress. Death usually takes place within 24 hours. Occasionally peritonitis, apart from perforation, is the cause of death. (4) Occasionally, but rarely, hyperpyrexia (excessive fever). (5) Complications, such as pulmonary or cerebral inflammation, bedsores, &c.

Certain sequelae are sometimes observed, the most important being the swelled leg, periostitis affecting long bones, general ill-health and anaemia, with digestive difficulties, often lasting for a long time, and sometimes issuing in pulmonary tuberculosis. Occasionally, after severe cases, mental weakness is noticed, but it is usually of comparatively short duration.

No disease has been more thoroughly studied in recent years than typhoid fever. The chief points requiring notice are (1) causation and spread, (2) prevalence, (3) treatment, (4) prevention.

Causation.—The cause is the *bacillus typhosus*, discovered by Eberth in 1880 (see PARASITIC DISEASES). This organism multiplies in the body of a person suffering from the disease, and is thrown off in the discharges. It enters by being swallowed and is conveyed into the intestine, where sets up the characteristic inflammation. It is found in the spleen, the mesenteric glands, the bile and the liver, not infrequently also in the bone marrow, and sometimes in the heart, lungs and kidneys, as well as in the faeces and the urine. It has also, though more rarely, been found in the blood. The illness is therefore regarded as a general toxaemia with special local lesions. The relation of the bacillus to the other numerous bacteria infesting the intestinal canal, some of which are undoubtedly capable of assuming a pathogenic character, has not been determined; but its natural history, outside the body, has been investigated with more positive results than that of any other micro-organism, though much still remains obscure. Certain conclusions may be stated on good evidence, but it is to be understood that they are all more or less tentative. (1) In crude sewage the bacillus does not multiply, but dies out in a few days. (2) In partly sterilized sewage (*i.e.* heated to 65° C.) it does not multiply, but dies out with a rapidity which varies directly with the number of other organisms present—the more organisms the quicker it dies. (3) It is said not to be found in sewer air, though Sir Charles Cameron, from a series of recent experiments, claims to have proved the contrary. (4) In ordinary water containing other organisms it dies in about a fortnight. (5) In sterilized water it lives for about a month. (6) In ordinary soil moistened by rain it has lived for 67 days, in sewage-polluted soil for at least 53 days, in soil completely dried to dust for 25 days, and in sterilized soil for upwards of 400 days. (7) Exposed to direct sunlight it dies in from four to eight hours. (8) It is killed by a temperature of 58 °C., but not by freezing or drying. (9) It multiplies at any temperature between 10° C. and 46° C., but most rapidly between 35° C and 42° C. These conclusions, which are derived from experiment, are to a considerable extent in agreement with certain observations on the behaviour of the disease on a large scale.

The susceptibility of individuals to the typhoid bacillus varies greatly. Some persons appear to be quite immune. The most susceptible age is adolescence and early adult life; the greatest incidence, both among males and females, is between the ages of 15 and 35. The aged rarely contract it. Men suffer considerably more than women, and they carry the period of marked susceptibility to a later age. Predisposing causes are believed to be debility, depression, the inhalation of sewer air by those unaccustomed to it, and anything tending to "lower the vitality," whatever that convenient phrase may mean. According to the latest theories, it probably means in this connexion a chemical change in the blood which diminishes its bactericidal power. The lower animals appear to be free from typhoid in nature; but it has been imparted to rabbits and other laboratory animals. There is no evidence that it is infectious in the sense in which small-pox and scarlet fever are infectious; and persons in attendance on the sick do not often contract it when sufficient care is taken. The recognition of these facts has led to a general tendency to underrate contagion, direct and indirect, from the sick to the healthy as a factor in the dissemination of typhoid fever; but it must be remembered that the sick, from whose persons the germs of the disease are discharged, are always an immediate source of danger to those about them. Such personal infection may become a very important means of dissemination. There is evidence that this is the case with armies in the field, *e.g.* the conclusions of the commission appointed to inquire into the origin and spread of enteric fever in the military encampments of the United States in the Cuban campaign of 1898. Out of 1608 cases most thoroughly investigated, more than half were found to be due to direct and indirect infection in and from the tents (Childs: Sanitary Congress, Manchester, 1902). A similar but perhaps less direct mode of infection was shown to account for a large number of cases under more ordinary conditions of life in the remarkable outbreak at Maidstone in 1897, which was also subjected to very thorough investigation. It was undoubtedly caused in the first instance by contaminated water, but 280 cases occurred after this cause had ceased to operate, and these were attributed to secondary infection, either direct or indirect, from the sick. A good deal of evidence to the same effect by medical officers of health in England has been collected by Dr Goodall, who has also pointed out that the attendants on typhoid patients in hospital are much more frequently attacked than is commonly supposed (*Trans. Epidem. Soc.* vol. xix.).

Recent discoveries as to the part played in the dissemination of typhoid fever by what are termed "typhoid carriers" have thrown light upon the subject of personal infection. The subject was first investigated by German hygienists in 1907, and it was found that a considerable number of persons who have recovered from typhoid fever continue to excrete typhoid bacilli in their faeces and urine (typhoid bacilluria). They found that after six weeks 4% to 5% of typhoid patients were still excreting bacilli; 23% of 65 typhoid patients at Boston City Hospital showed typhoid bacilli in their excretions ten days before their discharge. The liability of a patient to continue this excretion bears a direct relation to the severity of his illness, and it is probable that the bacilli multiply in the gall bladder, from which they are discharged into the intestine with the bile. The condition in a small number of persons may persist indefinitely. In 101 cases investigated, Kayser found three still excreting bacilli two years after the illness, and George Deane has recorded a case in which bacilli continued to be excreted 29 years afterwards.

Many outbreaks have in recent times been traced to typhoid carriers, one of the first being the Strassburg outbreak. The owner of a bakehouse had had typhoid fever ten years previously, and it was noticed that every fresh employé entering her service developed the disease. She prepared the meals of the men. On her exclusion from the kitchen the cases ceased. In Brentry reformatory, near Bristol, an outbreak numbering 28 cases was traced to a woman employed as cook and dairymaid who had had typhoid fever six years previously. Before entering the reformatory she had been cook to an institution for boarded-out girls, and during her year's residence there 25 cases had occurred. A case is reported by Huggenberger of Zürich (*Lancet*, October 1908) in which a woman carrier is said to have infected a series of cases lasting over 31 years, including her husband, son, daughter-in-law, and no less than nine different servants. Numerous cases of contamination of milk supplies by a "carrier" have been investigated, and in outbreaks traced to dairies it is wise to submit the blood of all employés to the agglutination test. A persistently high opsonic index to typhoid bacilli is notable among "carriers." Not only do persons who have had tyhpoid fever harbour bacilli, but also persons who come in contact with cases of the disease and who have no definite history of illness themselves.

The other means of dissemination are polluted soil, food and drink, particularly milk and water. The precise mode in which polluted soil acts is not understood. The result of experiments mentioned above shows that the bacillus lives and multiplies in such soil, and epidemiological investigation has repeatedly proved that typhoid persists in localities where the ground is polluted by the leakage of sewage or by the failure to get rid of excrementitious matter. In some instances, no doubt, drinking water thus becomes contaminated and conveys the germs, but there appears to be some other factor at work, for the disease occurs under the conditions mentioned where the drinking water is free from suspicion. Exhalation is not regarded as a channel of communication. The researches of Majors Firth and Horrocks prove that dust, flies and clothing may convey the germs. Another way in which food becomes the medium of conveyance is by the contamination of oysters and other shellfish with sewage containing typhoid bacilli. This has been abundantly proved by investigations in Great Britain, America and France. Uncooked vegetables, such as lettuces and celery, may convey the disease in a similar way. The most familiar and important medium, however, is water. It may operate directly as drinking water or indirectly by contaminating vessels used for holding other liquids, such as milk cans. Typhoid caused by milk or cream has generally been traced to the use of polluted water for washing out the cans, or possibly adulterating their contents. There is obviously no reason why this chain of causation should not hold good of other articles of food and drink. Outbreaks have been traced to ginger-beer and ice-creams. Water sources become contaminated directly by the inflow of drains or the deposit of excretal matter; indirectly, and more frequently, by the leakage of sewage into wells or by heavy rains which wash sewage matter and night-soil from ditches and the surface of the land into springs and watercourses. Water may further be contaminated in the mains by leakage, in domestic cisterns, and in supply pipes by suction. There is some reason to believe that the bacilli may multiply rapidly in water containing suitable nourishment in the absence of large numbers of their natural foes.

Prevalence.—Typhoid fever is more or less endemic and liable to epidemic outbreaks all over the world. It is more prevalent in temperate than in tropical climates. The following comparative death-rates show its relative prevalence in certain countries in 1890: Italy, 658; Austria, 470; U.S.A. 462; Prussia, 204; England, 179. It has undergone marked and progressive diminution in many countries coincidently with improved sanitation, particularly in regard to drainage and water-supply. Table I. gives annual death-rates in England and Wales after 1869, when typhoid was registered separately from typhus and "simple" fever.

London shows less improvement than Great Britain as a whole, but it started with superior sanitary conditions, and though the reduction has not been maintained in the last recorded quinquennium, the mortality is still much below the mean. The disease is more prevalent in Paris, but the diminution effected has been far greater in the time, the average annual mortality per million having fallen from 1430 in 1882 and 581 in 1883–1888 to 293 in 1889–1894 and 172 in 1895–1900. Other recorded instances of diminution are Berlin, Hamburg, Munich, Copenhagen, the Netherlands, Buenos Aires (from 1060 per million in 1890 to 140 in 1899). In all these and other cases the improvement is attributed either to drainage or water-supply, or both. The case of Munich is so instructive that it deserves special mention. For many years typhoid was excessively prevalent in that city. The prevalence was continuous, but aggravated by large epidemic waves, extending over several years. These gradually decreased in magnitude, and ceased towards the end of 1880. Since then the prevalence has still further diminished, the average annual mortality per million having fallen from 2024 in 1851–1860, 1478 in 1861–1870 and 1167 in 1871–1880 to 160 in 1881–1890 and 52 in 1891–1900.

TABLE I.—*Annual Mortality from Enteric Fever per Million Persons living—England and Wales.*

Year.	Mortality.	Year.	Mortality.
1869	390	1889	176
1870	388	1890	179
1871	371	1891	168
1872	377	1892	137
1873	376	1893	229
1874	374	1894	159
1875	371	1895	175
1876	309	1896	166
1877	279	1897	156
1878	306	1898	182
1879	231	1899	199
1880	261	1900	160
1881	212	1901	173
1882	229	1902	126
1883	228	1903	100
1884	236	1904	93
1885	175	1905	89
1886	184	1906	92
1887	185	1907	67
1888	172	1908	75

The diminution is more clearly shown if quinquennial periods are taken, as in Table II.

TABLE II.—*Average Annual Mortality per Million in England and Wales, and in London.*

	1871–75.	1876–80.	1881–85.	1886–90.	1891–95.	1896–1900.	1901–05.

London	256	234	226	150	136	148	—

It has been forcibly argued by Dr Childs (*Trans. Epidem. Soc.* vol. xvi.) that drinking water had little, if anything, to do with the prevalence of the disease, and that its gradual reduction was due to purification of the soil by improved drainage systems and the abolition of slaughter-houses. The epidemic waves were found by von Pettenkofer to be associated with the rise and fall of the subsoil water; when the water fell the fever rose, and vice versa. He did not, however, consider that the subsoil water exercised any influence itself; he merely regarded it as an index to certain conditions of moisture which exercised a favourable or unfavourable influence on the development of the disease. His theory, which has been much misunderstood, is to some extent corroborated by some facts observed in Great Britain. One is the seasonal prevalence of typhoid, which in England is an autumnal disease. The minimum occurs in May or June; in August a marked rise begins, which continues throughout the autumn and reaches a maximum in November, after which an abrupt fall sets in. These facts are in keeping with Pettenkofer's theory, for the subsoil water reaches its maximum height at the end of spring and falls throughout the summer and a great part of the autumn. The coincidence is further emphasized by the fact that in dry years, when the subsoil water sinks lower than usual, typhoid is more prevalent, and in wet years the contrary. A glance at the mortality table for England given above will show that the progressive improvement recorded down to 1892 was suddenly interrupted in 1893, when the rate rose abruptly from 137 to 229. That was an extraordinarily dry and hot year, and it was followed by a succession of dry and hot years, culminating in 1899, with two exceptions—1894 and 1897. In both the typhoid rate fell again, but in all the others it rose. One explanation has been suggested by Mr Matthew Adams of Maidstone. He points out that organic matter deposited on or in the ground passes in normal years gradually through several layers of soil, and undergoes a process of destruction or purification before reaching the underground water; but in hot summers the ground becomes baked and cracked, and there is no such percolation; when rain comes everything is swept suddenly away without any purification, and finds its way into the sources of drinking water.

Whether this be so or not, there is no doubt that dangerous material does collect during the summer and is swept into watercourses by the autumnal rains. Perhaps this is sufficient to account for the seasonal prevalence and the annual variations noted. There is, however, a great deal of typhoid which has no connexion with water-supply. Numerous cases of persistent prevalence have been investigated by the medical officers of the local government board, in which drinking water has been exonerated and the mischief attributed to standing pollution of the soil—for instance, Mold, Middlesbrough, Southend, Swinton and Pendlebury, &c. In such places the chronic prevalence is apt to swell at times to more epidemic proportions, as at Munich; and possibly the condition of the ground may be the cause. An examination of the relative incidence of typhoid in the counties of England and Wales (Bulstrode) goes to show that its prevalence, broadly regarded, is not capricious. The areas of maximum and minimum incidence remained practically the same throughout the twenty years 1871–1890, though there was everywhere a large diminution. This fact suggests the reflection that standing conditions are more important factors than those accidental occurrences which attract public attention by causing sudden and explosive outbreaks. When these are on a small scale they may be due to milk; on a large scale they are always water-borne and caused by sudden contamination of a public supply. The classical example is Maidstone. That outbreak began towards the end of August 1897, and within six weeks some 1500 persons were attacked. The total number of cases was 1847, with 132 deaths, in a population of about 34,000. With the exception of 280 cases of secondary infection, which lingered on till the following January, they all occurred before the 18th of October, and the disease subsided almost as rapidly as it arose. A mass of evidence of different kinds left no possibility of doubt that accidental contamination of a water-supply was the cause. Perhaps the most striking point was that Maidstone is supplied with water from three different sources, known as Cossington, Boarley and Farleigh, and out of 1681 cases the respective incidence in these areas was—Cossington 29, Boarley 69, Farleigh 1583. Another great example of water-borne typhoid is furnished by Philadelphia, where 14,082 cases occurred in 1898–1899.

Treatment.—Improved knowledge of the nature and causation of typhoid fever has not led to the successful introduction of a specific treatment; nor have means been found to cut short the illness, though its fatality has been reduced. It still goes through the classical stages, which broadly coincide with first, second and third weeks. Attempts have been made to deal directly with the toxins produced by the bacilli, on the hypothesis that they are formed in the intestinal canal, by the use of internal disinfectants, such as mercury, iodine, carbolic acid, salol, &c., and these agents are sometimes beneficial; but the treatment remains essentially symptomatic, and follows the principles that were recognized before the discovery of the *bacillus typhosus*. One of the most important improvements is the regular use of sponging or bathing for the reduction of temperature. It has even been developed into a continuous bath, in which the patient is kept in water throughout the illness. Since the recent development of serum-therapy various serums have been tried in the treatment of typhoid fever, and successful reports are given of the anti-endotoxic serum devised by Dr Allen Macfadyen, while Professor Chantemesse, in the statistics of serum treatment at the Bastion Hospital, Paris, states that from July 1901 to July 1907 he so treated 1000 cases, 43 proving fatal, a mortality of 4·3%. During the same period, 5621 cases were treated in fourteen other Paris hospitals, with 960 deaths, a mortality of 17%. Chantemesse's serum was employed by Professor Brunon at Rouen in 100 cases with three deaths, and Dr Josias of Paris in 200 cases with eight deaths in typhoid fever occurring in young children. The serum is taken from a horse which has received over a long period injections of an emulsion of the *bacillus typhosus* or a soluble toxin. Sir Almroth Wright has suggested the use of an autogenous vaccine in this as in other parasitic diseases, opsonic control being exercised.

The fatality of typhoid fever varies greatly. Age exercises a marked influence, the fatality rising steadily after the period 5 to 10 years. The importance of careful and intelligent nursing is undoubtedly great, but there is a tendency, encouraged by some nurses, on the part of the public to overestimate that factor and to think that nothing more is needed. This is a grave mistake. No disease requires more vigilant attention or greater medical experience. The following table shows quinquennial figures for the London Metropolitan Asylums Board hospitals.

	Metropolitan Asylums Board Hospitals.			County of London.
	Admissions.	Deaths.	Ratio per cent. of deaths to admissions.	Mean annual mortality per 1000 living.
1874–1878	1878	379	20	0·25
1879–1883	2049	381	19	0·23
1884–1888	1937	314	16	0·17
1889–1893	2517	415	16	0·13
1894–1898	3328	578	17	0·13
1899–1903	6779	1023	15	0·13
1904–1908	3084	457	15	0·05

Prevention.—If house drainage were always perfectly carried out, sewage satisfactorily disposed of, water-supply efficiently protected or treated, patients segregated, and the typhoid material excreted by them and typhoid "carriers" effectually annihilated—if, in short, scientific cleanliness were completely attained, the disease would disappear, or be at least excessively rare. In some communities much has been done in the directions indicated; but in many others the lessons of experience are ignored, and even in the best practice lags behind theory. This is mainly due to apathy and reluctance to spend money, but there are certain real difficulties which stand in the way. To discuss them fully would involve a lengthy consideration of drainage, water-supply and other matters, which would be out of place here; but some points must be noted. The most important is undoubtedly water-supply. The substitution of public water-supplies for shallow wells and small streams liable to pollution is one of the greatest factors in the diminution of typhoid and other water-borne diseases; but it may give rise to danger on a far larger scale, for a whole community may be poisoned at one blow when such a supply becomes contaminated. Unfortunately, it is extremely difficult to prevent contamination with certainty in a populous country. Theoretically, water may be pure at its source, and may be distributed in that condition. Such is water derived from deep wells and springs, or gathered from uncultivated and uninhabited uplands. In the one case it has undergone natural filtration in the ground; in the other, it escapes all risk of pollution. These waters are generally pure, but the condition cannot be relied on. A tramp or a shepherd may pollute the most remote gathering-ground unless it be fenced in; deep wells may be similarly fouled by workmen, and sewage may find its way into them from the surface or through fissures. In an outbreak of enteritis and typhoid fever at Leavesden Asylum, investigated by Dr A. Shadwell in 1899, the source of mischief was traced to contamination of the well, which was 250 ft. deep in the chalk. The contamination did not take place from the surface, but from some underground source, and there were grounds—corroborated by subsequent observation—for believing that it occurred at irregular intervals, and was probably connected with the level of the deep underground water. At the same time the similar well of a neighbouring poor-law school was found to be dangerously polluted, and it was ascertained that two others in the same locality had been condemned and closed in the past. The deep chalk in that neighbourhood was clearly unsafe, and this was thought to be due to the practice of digging holes called "dumb wells," but in reality cess-pits, as much as 40 ft. deep, in the chalk for the reception of sewage. The same practice is common in all inhabited localities on a chalk formation, as it is an extremely convenient way of disposing of sewage, which percolates away and renders it unnecessary to empty the cess-pit. Several similar cases of deep well pollution have been recorded, notably those of Houghton-le-Spring in 1889 and Worthing in 1893. To secure purity, therefore, and prevent liability to outbreaks of typhoid and other intestinal diseases, all gathering-grounds should be fenced in, and water, even from deep wells, should be regularly examined, both chemically and bacterioscopically, in order that any change in composition may be detected. In the water-supplies of great populations such examination should be made daily. Further, all supplies which are not above suspicion should be filtered through sand or sterilized by boiling. The latter can be carried out by simple means in the case of individual domestic water, and attempts have been made to apply it by means of mechanical apparatus to supplies on a larger scale. It is not, however, applicable to the water-supply of large towns, because of the liability of such apparatus to get out of order. Sand filtration is at present the best mode of dealing with these supplies. There is no purer water than that which has been properly treated by subsidence and sand filtration, even when it is taken from an impure source. So far as the prevention of typhoid and other water-borne disease is concerned, it is certainly safer than the unfiltered water which is taken from so-called pure sources. It cannot be a mere coincidence that London, Hamburg, Berlin and other towns using well-filtered but originally impure river water should be generally freer from water-borne disease than many large towns drawing their supply from purer sources but neglecting to filter it, such as Manchester, Glasgow and the American cities. Table III., prepared by Mr Caink, engineer to the city of Worcester, illustrates this fact, which has also been noted by Professor Saltet of Amsterdam as holding good of the Netherlands.

type and severity of the illness. Bacteriological science has here come to the assistance of the clinical physician with what is called the Widal or serum reaction, which has a great diagnostic value when carefully performed. Professor Chantemesse has also introduced a cutaneous reaction similar to von Pirquet's reaction in tuberculosis. But obviously these remedies can only be applied to persons in the position of patients; it is of no use in the case of those who do not proclaim themselves ill, but go about their business when suffering from the disease. Such "ambulatory" cases have long been recognized as an important factor in spreading the disease. Many of the most memorable epidemics have probably been caused by them, and it is difficult to see how they can be guarded against. The "typhoid-carrier," however, when discovered should be interdicted from the preparation of food and should undergo a course of treatment with a view to lessening their excretion of typhoid bacilli.

The prevention of typhoid among armies in the field is a problem of special difficulty, not in principle but because of the conditions. The water is generally polluted, and soldiers are too thirsty to wait while it is boiled or filtered, even if the means are at hand. The sanitary arrangements are such as to ensure the saturation of the ground with excreta; flies and dust abound; personal cleanliness is impossible, and men feed and sleep together in the closest proximity. No doubt a great deal might be done by efficient sanitary organization, which has hitherto been lacking, and by educating the men. Dr Leigh Canney in 1901 suggested a scheme for dealing systematically with the water-supply of an army. Extraordinary results were obtained by the Japanese army medical department in the Russo-Japanese War of 1904–5 in the prevention of typhoid fever, which up to that period was responsible for the largest mortality of any disease affecting armies in the field. Handbooks on the avoidance of cholera, plague and typhoid fever were issued to the troops. Boiled water in quantities was provided for the soldiers, each battalion having its boiling outfit. Even foreign attachés and correspondents were requested to observe the regulations on this point. With this there was a systematic advance testing of wells, the wells being labelled "fit for drinking" or "for washing purposes only." It being impossible to suppress the presence of flies on food, care was taken to cover all latrines and cover and disinfect excreta, so that infection from flies was reduced to a minimum. Food was transferred from sterilized caldrons into sterilized lacquer boxes and served on sterilized plates. A crematory was attached to base hospitals, where all nightsoil, garbage and waste was burnt daily. Owing to these precautions the incidence of infectious disease, notably typhoid fever, was reduced to a figure unparalleled in any previous war, only 3·51% of the total sickness being due to infectious disease. Taking the number of men at the front in April 1905 to have been 599,617, the entire deaths from infectious and contagious diseases amounted to 1·24% of the entire army in the field.

TABLE III.—*Occurrences of Typhoid according to Sources of Water-Supply.*

Source of Water.	Town.	Annual Typhoid Case-rate per 100,000.								
		1892.	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.

Average of 219 towns		88	142	103	115	102	100	115	127	116

The amount of typhoid is dependent on other factors besides the water-supply, but the close connexion between the two and the influence of filtration are well attested by the experience of Worcester, where the great reduction recorded since 1894 coincided with new and improved filtration. The weak point about sand filtration is that it is apt to be imperfectly performed when the filters are frozen or newly cleaned, or when the process is too rapid. Filtration through porcelain is an efficient purifier, but it is not applicable to supplies on a large scale, and is liable to break down through clogging of the filters. Other portable filters are regarded as useless or worse. The best emergency treatment for suspected drinking water is boiling. Contamination of water in the mains is due to bad laying, and ought never to occur; that of supply pipes can be prevented by a constant service, and of domestic filters by providing them with covers.

Next to water-supply, and hardly less important, is drainage. The drying and cleansing of the soil by good household drainage and sewerage is essential to the prevention of typhoid. Cess-pits, leaking drains and privies, especially when there is only one to several houses, as in many industrial towns, are powerful allies of this disease. The drainage of all old houses is defective and dangerous. The ground about them is commonly honeycombed with cess-pits and saturated with sewage. The only way to discover and remedy such defects is to lay them bare with the pickaxe and shovel. Soil-pipes should always be trapped and ventilated. In short, no disease requires for its prevention more careful attention to house sanitation. The paving of yards and other spaces is also desirable in towns, on account of the liability of the unprotected soil to harbour moisture and filth.

Other modes by which the disease is spread—such as shellfish, milk and uncooked vegetables—suggest their own remedy. The dissemination by dust and flies is less easily prevented. All that can be done is to segregate the sick and promptly destroy all dangerous matters proceeding from them. It should be remembered that the urine may be an even greater source of danger than the faeces. The same observation applies to the prevention of infection from person to person. There is no doubt that sufficient care is often wanting, even in hospitals, in handling patients' soiled linen and clothes, and in dealing promptly and effectually with their excreta. For the effectual segregation and treatment of persons suffering from typhoid prompt recognition is necessary; and this, unfortunately, is a matter of much difficulty on account of variation in the

In a table furnished by the Japanese war office at a still later date we note the small percentage of typhoid fever.

Percentage of patients in entire Army Corps at a certain date:—

Wounds received in action	45·53
Other wounds and injuries	3·71
Typhoid fever	1·61
Dysentery	1·95
All other diseases	47·20

In the statistics of General Oku's army, calculated to be at least 75,000 strong, Major-General Mori, chief medical officer, reports the typhoid cases to be 66 only between the dates of October 1904 and April 1905. Of this army 2142 were invalided home or died; 133 only being cases of typhoid fever.

The sickness incidence in the First Army under General Kuroki was as follows during the first six months of the campaign:—

Months.	Sickness: all Diseases.	Typhoid Fever.
March	3829	3
April	3545	1
May	3154	9
June	4824	9
July	5565	4
August	6006	9

The figures are interesting when we consider that during the South African War of 1899–1902 no fewer than 31,000 men were invalided home to England on account of typhoid fever.

One other point requires mention in connexion with prevention, namely, protective inoculation. This is performed with an anti-toxic substance prepared from dead cultures of bacilli, and has been tried on a fairly large scale, particularly on the British army in India and South Africa. Sir W. B. Leishman, writing on the results of anti-typhoid inoculations in the army (*Journ. of R.A.M.C.*, February 1909), gives the total number of men inoculated up to the 1st of June 1908 as 5473, amongst whom 21 cases (3·8 per 1000) with 2 deaths occurred. The number non-inoculated, 6610 men, had an incidence of 187 cases (28·3 per 1000) with 26 deaths. The case mortality of the inoculated was 9·5%, of the non-inoculated 13·8%. Several regiments however were not exposed to enteric fever. If these be excluded the incidence in the inoculated is 6·6 per 1000 against 39·5 per 1000 in the non-inoculated. Lord Kitchener, speaking at Middlesex Hospital in October 1910, bore emphatic testimony to the value of inoculation coupled with improved sanitary methods on the health of the army in India, declaring his belief that enteric would before long join cholera in total banishment from the barracks.

TYPHON (Typhaon, Typhoeus), in Greek mythology, youngest son of Gaea and Tartarus. He is described as a grisly monster with a hundred dragons' heads, who was conquered and cast into Tartarus by Zeus. In other accounts, he is confined in the land of the Arimi in Cilicia (*Iliad*, ii. 783) or under Etna (Aeschylus, *P.V.* 370) or in other volcanic regions, where he is the cause of eruptions. Typhon is thus the personification of volcanic forces. Amongst his children by Echidna are Cerberus, the Lernaean hydra, and the Chimaera. He is also the father of dangerous winds (typhoons), and by later writers is identified with the Egyptian Seth.

See Eduard Meyer, *Set-Typhon* (1875), and M. Mayer, *Die Giganten und Titanen* (1887); Preller-Robert, *Griechische Mythologie* (1894), pp. 63–66; O. Gruppe, *Griechische Mythologie*, ii. 845, 1333, according to whom Typhon, the "snake-footed" earth-spirit, is the god of the destructive wind, perhaps originally of the sirocco, but early taken by the Phoenicians to denote the north wind, in which sense it was probably used by the Greeks of the 5th century in nautical language; and also in *Philologus*, ii. n.f. (1889), where he endeavours to prove the identity of Typhon with the Phoenician Zephon (Baal-Zephon, translated in Gesenius's *Thesaurus* by "locus Typhonis" or "Typhoni saar"), signifying "darkness," "the north wind," and perhaps "snake"; A. von Mess, "Der Typhonmythus bei Pindar und Aeschylus," in *Rhein. Mus.* lvi. (1901), 167.

TYPHOON (probably from the Arabic and Hindustani *tufān*, a tempest, which is perhaps derived from Typhon, *q.v.*: the Chinese *t'ai fung*, strong wind, is not used in application to typhoons), the name given to a heavy cyclonic storm in the seas fringing the eastern coast of Asia from Japan to the Philippine Islands. Typhoons generally occur in a series during the months of August, September and October, the season when the belt of equatorial calms in the Pacific Ocean reaches its most northerly extension.

TYPHUS FEVER (from Gr. τῦφος, smoke or mist, in allusion to the stupor of the disease), an acute infectious disease of highly contagious nature, lasting for about fourteen days, and characterized mainly by great prostration of strength, severe nervous symptoms, and a peculiar eruption on the skin. It has received numerous other names, such as pestilential, putrid, jail, hospital fever, exanthematic typhus, &c. It appears to have been known for many centuries as a destructive malady, frequently appearing in epidemic form, in all countries in Europe, under the conditions to be afterwards referred to. The best accounts of the disease are those given by old English writers, who narrate its ravages in towns and describe many "black assizes," in which it was communicated by prisoners brought into court to the judges, jurymen, court officials, &c., with fatal effect. Typhus fever would seem to have been observed in almost all parts of the world; but it has most frequently prevailed in temperate or cold climates.

The conditions concerned in its production include both the predisposing and the exciting. Of the former the most powerful are those influences which lower the health of a community, especially overcrowding and poverty. Hence this fever is most frequently found to affect the poor of large cities and towns, or to appear where large numbers of persons are living crowded together in unfavourable hygienic conditions, as has often been seen in prisons, workhouses, &c. Armies in the field are also liable to suffer from this disease; for instance, during the Crimean War it caused an enormous mortality among the French troops. Recently, however, an important change of view of the connexion of typhus fever has arisen. Professor Matthew Hay (*Journal of Public Health*, September 1907) attributes the spread of typhus fever to fleas. His observations are based on the epidemic in Aberdeen. He sums up his conclusions in the following manner: (1) Every case in hospital examined by Professor Hay and his assistants was flea bitten, and those of the staff who complained of flea bites were attacked. Care was exercised to distinguish between flea bites and petechiae. (2) Where a patient was apparently free from bites it was found he had been in contact with verminous families. (3) The disease did not spread in clean houses with clean inhabitants, even when a typhus patient remained in the dwelling during his entire illness. (4) All nurses or wards-maids who were attacked were in contact with the patients when they were first admitted. No nurse, wards-maid or doctor who had been in close contact with the cases when cleaned contracted the disease. (5) An ambulance driver who complained of being pestered by fleas contracted typhus fever, but when the ambulance staff were adequately protected from fleas no other cases developed.

Typhus is now regarded as certainly due to the action of some specific micro-organism (see Parasitic Diseases), but the bacteriology is still imperfect. In 1891 Jaroslav Hlava, of Prague, found in the blood of 20 out of 33 cases of typhus a well-defined organism which he termed the strepto-bacillus. Lewaschew in 1892 found in the blood and spleen of typhus patients small round highly refractive actively-moving bodies lying between the corpuscles. Sometimes these bodies were flagellate. Dubieff and Bruhl also found a diplococcus in the blood which they named the diplococcus exanthematicus.

The course of typhus fever is characterized by certain well-marked stages. 1. The stage of *incubation*, or the period elapsing between the reception of the fever poison into the system and the manifestation of the special evidence of the disease, is believed to vary from a week to ten days. During this time, beyond feelings of languor, no particular symptoms are exhibited.

2. The *invasion* of the fever is in general well marked and severe, in the form of a distinct rigor, or of feelings of chilliness lasting for hours, and a sense of illness and prostration, together with headache of a distressing character and sleeplessness. Feverish symptoms soon appear and the temperature of the body rises to a considerable height (103°–105° F.), at which it continues with little daily variation until about the period of the crisis. It is, however, of importance to observe certain points connected with the temperature during the progress of this fever. Thus about the seventh day the acme of the fever heat has been reached, and a slight subsidence (1° or less) of the temperature takes place in favourable cases, and no further subsequent rise beyond this lowered level occurs. When it is otherwise, the case often proves a severe one. Again, when the fever has advanced towards the end of the second week, slight falls of temperature are often observed, prior to the extensive descent which marks the attainment of the crisis. The pulse in

typhus fever is rapid (100–120 or more) and at first full, but later on feeble. Its condition as indicating the strength of the heart's action is watched with anxiety. The tongue, at first coated with a white fur, soon becomes brown and dry, while sordes (dried mucus, &c.) accumulate upon the teeth; the appetite is gone; and intense thirst prevails. The bowels are as a rule constipated, and the urine is diminished in amount and high coloured. The physician may make out distinct enlargement of the spleen.

3. The third stage is characterized by the appearance of the *eruption*, which generally shows itself about the fourth or fifth day or later, and consists of dark red (mulberry-coloured) spots or blotches varying in size from mere points to three or four lines in diameter, very slightly elevated above the skin, at first disappearing on pressure, but tending to become both darker in hue and more permanent. They appear chiefly on the abdomen, sides, back and limbs, and occasionally on the face. Besides this characteristic typhus rash, there is usually a general faint mottling all over the surface. The typhus rash is rarely absent and is a very important diagnostic of the disease. In the more severe and fatal forms of the fever the rash has all through a very dark colour, and slight subcutaneous haemorrhages (petechiae) are to be seen in abundance. After the appearance of the eruption the patient's condition seems to be easier, so far as regards the headache and discomfort which marked the outset of the symptoms; but this is also to be ascribed to the tendency to pass into the typhous stupor which supervenes about this time, and becomes more marked throughout the course of the second week. On the examination of the blood a marked leucocytosis is present. This is considered to be diagnostic in doubtful cases when the rash is badly marked. The patient now lies on his back, with a dull dusky countenance, an apathetic or stupid expression, and contracted pupils. All the febrile symptoms already mentioned are fully developed, and delirium, usually of a low muttering kind, but sometimes wild and maniacal (*delirium ferox*), is present both by night and day. The peculiar condition to which the term "coma vigil" is applied, in which the patient, though quite unconscious, lies with eyes widely open, is regarded, especially if persisting for any length of time, as an unfavourable omen. Throughout the second week the symptoms continue unabated; but there is in addition great weakness, the pulse becoming very feeble, the breathing shallow and rapid, and often accompanied with bronchial sounds.

4. A *crisis* or favourable change takes place about the end of the second or beginning of the third week (on an average the 14th day), and is marked by a more or less abrupt fall of the temperature and of the pulse, together with slight perspiration, a discharge of loaded urine, the return of moisture to the tongue, and by a change in the patient's look, which shows signs of returning intelligence. Although the sense of weakness is extreme, convalescence is in general steady and comparatively rapid.

Typhus fever may, however, prove fatal during any stage of its progress and in the early convalescence, either from sudden failure of the heart's action—a condition which is specially apt to arise—from the supervention of some nervous symptoms, such as meningitis or of deepening coma, or from some other complication, such as bronchitis. Further, a fatal result sometimes takes place before the crisis from sheer exhaustion, particularly in the case of those whose physical or nervous energies have been lowered by hard work, inadequate nourishment and sleep, or intemperance.

Occasionally troublesome sequelae remain for a greater or less length of time. Among these may be mentioned mental weakness or irritability, occasionally some form of paralysis, an inflamed condition of the lymphatic vessels of one leg (the swelled leg of fever), prolonged weakness and ill health, &c. Gradual improvement, however, may be confidently anticipated and even ultimately recovery.

The mortality from typhus fever is estimated by Charles Murchison (1830–1879) and others as averaging about 18% of the cases, but it varies much according to the severity of type (particularly in epidemics), the previous health and habits of the individual, and very specially the age—the proportion of deaths being in striking relation to the advance of life. Thus, while in children under fifteen the death-rate is only 5%, in persons over fifty it is about 46%.

The treatment of typhus fever includes the prophylactic measures of attention to the sanitation of the more densely populated portions of towns. Where typhus has broken out in a crowded district the prompt removal of the patients to a fever hospital and the thorough disinfection and cleansing of the infected houses are to be recommended. Where, however, a single case of accidentally caught typhus occurs in a member of a family inhabiting a well-aired house, the chance of it being communicated to others in the dwelling is small; nevertheless every precaution in the way of isolation and disinfection should be taken.

Treatment.

The treatment of a typhus patient is conducted upon the same general principles as in typhoid. Complete isolation should be maintained throughout the illness, and due attention given to the ventilation and cleansing of the sick chamber. Open-air treatment when practicable greatly reduces the temperature. The main element in the treatment of this fever is good nursing, and especially the regular administration of nutriment, of which the best form is milk, although light plain soup may also be given. The food should be administered at stated intervals, not, as a rule, oftener than once in one and a half or two hours, and it will frequently be necessary to rouse the patient from his stupor for this purpose. Sometimes it is impossible to administer food by the mouth, in which case recourse must be had to nutrient enemata. Alcoholic stimulants are not often required, except in the case of elderly and weakly persons who have become greatly exhausted by the attack and are threatening to collapse. When the pulse shows unsteadiness and undue rapidity, and the first sound of the heart is but indistinctly heard by the stethoscope, the prompt administration of stimulants (of which the best form is pure spirit) will often succeed in averting danger. Should their use appear to increase the restlessness or delirium they should be discontinued and the diffusible (ammoniacal or ethereal) forms tried instead.

Many other symptoms demand special treatment. The headache may be mitigated by removing the hair and applying cold to the head. The sleeplessness, with or without delirium, may be combated by quietness, by a moderately darkened room (although a distinction between day and night should be made as regards the amount of admitted light), and by soothing and gentle dealing on the part of the nurse. Opiate and sedative medicines in any form, although recommended by many high authorities, must be given with great caution, as their use is often attended with danger in this fever, where coma is apt to supervene. When resorted to, probably the safest form is a combination of the bromide of potassium or ammonium with a guarded amount of chloral. Alarming effects sometimes follow the administration of opium. Occasionally the deep stupor calls for remedies to rouse the patient, and these may be employed in the form of mustard or cantharides to the surface (calves of legs, nape of neck, over region of heart, &c.), of the cold affusion, or of enemata containing turpentine. The height of the temperature may be a serious symptom, and antipyretic remedies appear to have but a slight influence over it as compared to that which they possess in typhoid fever, acute rheumatism, &c. Hugo Wilhelm von Ziemssen (1829–1902) strongly recommends baths in hyperpyrexia, the temperature of the bath being gradually reduced by the addition of ice. Cold sponging of the hands and feet and exposed parts, or cold to the head, may often considerably lower the temperature. Throughout the progress of a case the condition of the bladder requires special attention, owing to the patient's drowsiness, and the regular use of the catheter becomes, as a rule, necessary with the advance of the symptoms.

TYPOGRAPHY (*i.e.* writing by types) is the general term for the art of printing movable (cast-metal) types on paper, vellum, &c. It is distinct from writing, and also from wood-engraving or xylography, which is the art of cutting figures, letters, words, &c., on blocks of wood and taking impressions from such blocks by means of ink, or any other fluid coloured substance, on paper or vellum.

I.—History of Typography

Although the art of writing and that of block-printing both differ widely from printing with movable metal types, yet this last process has apparently been such a gradual transition from block-printing,[1] and block-printing in its turn such a natural outcome of the many trials that were probably made to produce pictures, books, &c., in some more expeditious manner than could be done with handwriting, that a cursory glance at these two processes will not seem out of place, especially as a discussion on the origin and progress of typography could hardly be understood without knowing the state of the literary development at the time that printing appeared.

First Attempts at Printing.

The art of printing, *i.e.* of impressing (by means of certain forms and colours) figures, pictures, letters, words, lines, whole pages, &c., on other objects, as also the art of engraving, which is inseparably connected with printing, existed long before the 15th century. Not to go back to remoter essays, there is reason to suppose that medieval kings and princes (among others William

[1] We do not deal here with copperplate engraving (chalcography), nor with the question, raised by some authors, whether this art preceded that of wood-engraving (xylography), or vice versa. The earliest known date of the former is 1446 on the small engravings of "the Passion" in the Berlin Royal Print Room, whereas the earliest known date of wood-engraving is 1418 (on the Brussels Mary engraving). Both arts were naturally dependent upon MSS. for the forms of their letters, but as to the question of transition from the art of writing to that of typography, xylography alone can be regarded as the intervening and connecting link between those two arts, and there are good reasons for assuming that the inventor of printing with movable types was a xylographer (see below).

the Conqueror) had their monograms cut on blocks of wood or metal in order to impress them on their charters. Such impressions from stamps are found instead of seals on charters of the 15th century. Manuscripts, even of the 12th century, show initials which, on account of their uniformity, are believed to have been impressed by means of stamps or dies.[1] Before the invention of printing, say about 1436, bookbinders are known to have impressed names or legends or other inscriptions on their bindings in two ways: (1) by means of single, insulated letters engraved reversely downwards into a stamp of brass, whereby the letters appeared en relief on the leather or parchment of the binding; (2) by letters engraved reversely en relief on the brass stamp, whereby the letters sank into the binding. For this reason the term *impressor*, applied afterwards to the "printer," was, in the first instance, applied to the binder, whereas *ligator* was the proper word for him (see F. Falk, *Der Stempeldruck*, in "Festschrift," 1900, p. 73 sqq.; Zedler, *Gutenberg-Forschungen*, 1901, p. 6). But the idea of "multiplying" representations from one engraved plate or block or stamp, or other form, was unknown to the ancients, whereas it is predominant in what we call the art of block-printing, and especially in that of typography, in which the same types can be used again and again.

East Asiatic Printing.

Block-printing and printing with movable types seem to have been practised in China and Japan long before they were known in Europe. It is said that in the year 175 the text of the Chinese classics was cut upon tablets, and that impressions were taken of them, some of which are supposed to be still in existence. Printing from wooden blocks can be traced as far back as the 6th century, when the founder of the Suy dynasty is said to have had the remains of the classical books engraved on wood, though it was not until the 10th century that printed books became common. In Japan the earliest example of block-printing dates from the period 764–770, when the empress Shiyau-toku, in pursuance of a vow, had a million small wooden toy pagodas made for distribution among the Buddhist temples and monasteries, each of which was to contain a dhâranî out of the Buddhist Scriptures, entitled "Vimala nirbhasa Sûtra," printed on a slip of paper about 18 in. in length and 2 in. in width, which was rolled up and deposited in the body of the pagoda under the spire. In a journal of the period, under the year 987, the expression "printed book" (*suri-hoñ*) is applied to a copy of the Buddhist canon brought back from China by a Buddhist priest. This must have been a Chinese edition; but the use of the term implies that printed books were already known in Japan. It is said that the Chinese printed with movable types (of clay) from the middle of the 11th century. The authorities of the British Museum exhibit as the earliest instance of Korean books printed with movable types a work printed in 1337. To the Koreans is attributed the invention of copper types in the beginning of the 15th century; and an inspection of books bearing dates of that period seems to show that they used such types, even if they did not invent them.[2]

From such evidence as we have, it would seem that Europe is not indebted to the Chinese or Japanese for the art of block-printing, nor for that of printing with movable types.

MS. Period.

In Europe, as late as the second half of the 14th century, every book and every public and private document was written by hand; all figures and pictures, even playing cards and images of saints, were drawn with the pen or painted with a brush. In the 13th century there already existed a kind of book trade. The organization of universities as well as that of large ecclesiastical establishments was at that time incomplete, especially in Italy, France and Germany, without a staff of scribes and transcribers (*scriptores*), illuminators, lenders, sellers and custodians of books (*stationarii librorum, librarii*), and *pergamenarii, i.e.* persons who prepared and sold the vellum or parchment required for books and documents. The books supplied were for the most part theological, legal and educational, and are calculated to have amounted to above one hundred different works. As no book or document was approved unless it had some ornamented and illuminated initials or capital letters, there was no want of illuminators. The workmen scribes and transcribers were, perhaps without exception, calligraphers, and the illuminators for the most part artists. Beautifully written and richly illuminated manuscripts on vellum became objects of luxury which were treasured by princes and people of distinction. Burgundy of the 15th century, with its rich literature, its wealthy towns, its love for art and its school of painting, was in this respect the centre of Europe, and the libraries of its dukes at Brussels, Bruges, Antwerp, Ghent, &c., contained more than three thousand beautifully illuminated MSS.

Classes of Writing.

In speaking of the writing of the manuscripts of the 15th and preceding centuries it is essential to distinguish in each country between at least four different classes of writing, two of which must be again subdivided into two classes.

1. The *book hand*, that is, the ordinary writing of theological, legal and devotional books, used by the official transcribers of the universities and churches, who had received a more or less learned education, and consequently wrote or transcribed books with a certain pretence of understanding them and of being able to write with greater rapidity than the ordinary calligrapher. Hence they produced two kinds of writing: (*a*) the *current* or *cursive book hand*, of which several illustrations are given in Wilh. Schum, *Exempla Codicum Amplon. Erfurtensium*; the volumes of the (London) Palaeogr. Society, &c. Quite distinct from this current writing, and much clearer and more distinct, is (*b*) the *upright* or *set book hand*, which was employed not only by writers who worked for universities and churches, but also by persons who may be presumed to have worked in large cities and commercial towns for schools and the people in general without university connexion. (2) In the *church hand* (Gothic or black letter) were produced transcripts of the Bible, missals, psalters and other works intended for use in churches and private places of worship and devotion. This writing we may again subdivide into two classes: (*a*) the *ornamental* or *calligraphic* writing, found exclusively in books intended for use in churches or for the private use of wealthy and distinguished persons, and (*b*) the ordinary *upright* or *set church hand*, employed for less ornamental and less expensive books. (3) The *letter hand* may be said to be intermediate between the set literary book hand and the set literary church hand, and to differ but little from either. It was employed in all public documents of the nature of a letter. (4) The *court* or *charter hand* was used for charters, title-deeds, papal bulls, &c.[3]

These different kinds of writing served again, in the first instance, as models for cutting the inscriptions and explanatory texts that were intended to illustrate and explain the figures in blockbooks, and afterwards as models for the types used in the printing of books and documents.

15th-Century Books, Written.

Dypold Läber (Lauber), a teacher and transcriber at Hagenau in Germany, is known to have carried on a busy trade in manuscripts about the time of the invention of printing. His prospectuses[4] in handwriting of the middle of the 15th century announce that whatever books people wish to have, large or small, "geistlich oder weltlich, hübsch gemolt," are all to be found at Dypold Lauber's the scribe. He had in stock *Gesta Romanorum, mit den Viguren gemolt*; poetical works (*Parcival, Tristan, Freidank*); romances of chivalry (*Der Witfarn Ritter*; *Von eime Getruwen Ritter der sin eigen Hertze gab umb einer schönen Frowen willen*; *Der Ritter unter dem Zuber*); biblical and legendary works (*A Rimed Bible*; *A Psalter, Latin and German*; *Episteln und Evangelien durch das Jor*; *Vita Christy*; *Das gantze Passional, winterteil und summerteil*; devotional books (*Bellial*; *Der Selen Trost*; *Der Rosenkrantz*; *Die zehn Gebot mit Glosen*; *Small Bette-Bücher*); and books for the people (*Gute bewehrte Artznien-Bücher*; *Gemolte Loss-Bücher, i.e.* fortune-telling books; *Schachtzabel gemolt*). The lower educational books consisted for the most part of the *Abecedaria*, containing the alphabet, the Lord's Prayer, the creed, and one or two prayers; the *Donatus*, a short Latin grammar extracted from the work of Aelius Donatus, a Roman grammarian of the 4th century, and distinctly mentioned in a school ordinance of Bautzen of 1418; the *Doctrinale*, a Latin grammar in *leonine* verse, compiled by Alexander Gallus (or De Villa Dei), a minorite of Brittany of the 13th century; the *Summula logica* of Petrus Hispanus (afterwards Pope John XXI.), used in the teaching of logic and dialectics; and Dionysius Cato's *Disticha de Moribus*, and its supplement called *Facetus*, with the *Floretus* of St Bernard, used in the teaching of morals. As helps to the clergy in educating the lower classes, and as a means of assisting and promoting private devotion, there were picture books accompanied with an easy explanatory text, for the most part representations of the mystic relation

[1] Passavant, *Le Peintre-Graveur*, i. 18 (Leipzig, 1860–1864); John Jackson, *Wood Engraving* (London, 1839); Bruno Bucher, *Gesch. der techn. Künste*, I. p. 362 seq.

[3] See further PALAEOGRAPHY.

[4] An original copy of one of them is in the British Museum (Addit. MS. 28752).

between the Old and New Testaments (typology). Among these books the *Biblia pauperum*[1] stands first. It represents pictorially the life and passion of Christ, and there exist MSS. of it as early as the 13th century, in some cases beautifully illuminated.[2] A richly illuminated MS. of it, executed in the Netherlands *c.* 1400, is in the British Museum (press-mark, King's 5), and also fragments of one of the 14th century (press-mark, 31,303). A remodelling and development of this work is the famous *Speculum humanae salvationis*, of which we shall speak when dealing with the block-books and early printed books. It was written in rhymed prose before 1324, and represents, in forty-five chapters, the Bible history of the fall and redemption of mankind interwoven with Mariolatry and legend. Of this work alone more than 200 MSS., illuminated or without pictures, are known to exist in various libraries of Europe. The National and Arsenal Libraries in Paris each possess one written some time after 1324; the British Museum has sixteen MSS. of it (eleven of which are illuminated) of the 14th and 15th centuries, written in the Netherlands, Germany, France and England, one (press-mark, 16,578) bearing the distinct date 1379 and another (press-mark, Egerton, 878) that of 1436. A work of a similar nature is the *Apocalypsis*, of which at least two recensions with illustrations may be pointed out. One gives the text as we know it, with or without commentary, for which cf. Brit. Mus. 17,333 (French), 18,633 (French, but written in England), Reg. 2 D. xiii. and 22,493 (French)—all four early 14th century. Another is more a short history or biography of St John, but the illustrations follow those of the former work very closely; cf. Brit. Mus. 19,896 (15th century, German). It is this last recension which agrees with the blockbook to be mentioned hereafter. Other devotional works are the *Ars Moriendi*, the *Antichrist* and other works which will be mentioned below among the blockbooks.

Block-printing or Xylography.—When all this writing, transcribing, illustrating, &c., had reached their period of greatest development, the art of printing from wooden blocks (block-printing, xylography) on silk, cloth, vellum, paper, &c., made its appearance in Europe. This art was already a great advance on writing, in that it enabled any one with a few simple tools to multiply impressions from any block of wood with text or pictures engraved on it, and so produce a number of single (paper) leaves or sheets with text or pictures printed on them in almost the same time that a scribe produced a single copy of them.

It seems to have been practised, so far as we have evidence, on cloth, vellum and other stuffs as early as the 12th century (Weigel, *Anfänge*, i. 10); and on paper as far back as the second half of the 14th century; while it began to be largely employed in the early part of the 15th all over Germany, Flanders and Holland in the production of (1) separate leaves (called *briefs*, from *breve*, scriptum), containing either a picture (*print*, *prent*, shortened from the Fr. *emprint*, *empreinte*, and already used by Chaucer, *C.T.* 6186, six-text, D. 604, *printe*, *prente*, *preente*, and in other early English documents; also called in colloquial German *Helge*, *Helglein*, or *Halge*), or a piece of text, or both together; and of (2) whole sheets (two leaves), a number of which, arranged like the MSS. in quires or gatherings, formed what are called "blockbooks," sometimes consisting of half picture and half text, or wholly of text, or altogether of picture.

Early dated Wood-Engravings. The earliest dated woodcut that we know of is the Mary engraving, discovered at Malines, and now preserved in the Brussels Royal Library. It bears the date mccccxviii. Some authors have asserted that an *l* has been scratched out between the fourth *c* and the *x*; that, therefore, the date is 1468. But there is no ground for such an assertion (cf. H. Hymans, *L'Estampe de 1481*, Brussels, 1903). A slightly modified reproduction of it, on a reduced scale, which could hardly be placed later than 1460, is preserved in the St Gall Library. The next date is 1423 found on the St Christopher, preserved in the John Rylands Library (Spencer collection) at Manchester. In the third place comes the woodcut of 1437 preserved in the Imperial Library at Vienna, which was discovered in 1779 in the monastery of St Blaise in the Black Forest, and represents the martyrdom of St Sebastian, with fourteen lines of text. The date, however, is said by some to refer to a concession of indulgences. A woodcut, preserved in the same library in Vienna, which represents St Nicolas de Tolentino, has the date 1440, but written in by hand; as the saint was canonized in that year it may refer to that event. Another in the Weigel collection, representing the bearing of the cross, St Dorothea and St Alexis, has the date 1443, also written in by hand, though the woodcut is considered to belong to that period. These are the only known wood-engravings with dates ranging from 1418 to 1443. But there exist a good many woodcuts which, from the style of the engraving, are presumed to be of an earlier date, and to have been printed partly in the 14th and partly in the first half of the 15th century. J. D. Passavant (*Le Peintre-Graveur*, 1860–1864, i. 27 seq.) enumerates twenty-seven of them, all of German origin and preserved in various libraries in Germany; 154 are recorded in the *Collectio Weigeliana* (vol. i., 1866), and W. L. Schreiber (*La Gravure sur bois*, vols. i. and ii., 1891 and 1892) enumerates over 2000 of them, some of which may be ascribed to the Netherlands, *exx.g.* (1) representing the Virgin Mary, with Flemish inscriptions in the museum in Berlin; (2) representing the Virgin Mary (see above) in the library at Brussels; (3) representing St Anthony and St Sebastian, in the Weigel collection (now in the Brit. Mus.); (4) a St Hubert and St Eustatius, in the royal library at Brussels; (5) representing the Child Jesus, in the library at Berlin; (6) the Mass of St Gregory, with indulgence, in the Weigel collection (cf. 1, 195), now at Nuremberg.

In these blocks, as in wood-engraving now, the lines to be printed were in relief. The block, after the picture or the text had been engraved upon it, was first thoroughly wetted with a thin, watery, pale brown material, much resembling distemper; then a sheet of damp paper was laid upon it, and the back of the paper was carefully rubbed with some kind of dabber or burnisher, usually called a *frotton*, till an impression from the ridges of the carved block had been transferred to the paper. In this fashion a leaf or sheet could only be printed on one side (anopisthographic); and in some copies of blockbooks we find the sides of the leaves on which there is no printing pasted together, so as to give the work the appearance of an ordinary book. Any one wanting to set up as a printer of briefs or books needed no apparatus but a set of woodblocks and a rubber. We know only three blockbooks which do not possess this characteristic, as the *Legend of St Servatius* in the royal library of Brussels, which may be called a xylo-chirograph (see below), in which the pictures occur on both sides of the paper (with some lines of text *written* underneath), but apparently impressed by hand from blocks without any rubbing, there being no traces of any indentures either on the rectos or the versos; *Das Zeitglöcklein* in the Bamberg Library (cf. Falkenstein, p. 49); *Das geistlich und weltlich Rom*, in the John Rylands Library (Spencer collection) and at Gotha (cf. Falkenstein, p. 46); but these belong to the end of the 15th century, and therefore to a later period than the ordinary blockbooks.

Block Printers. Formerly it was the general opinion that playing cards had been the first products of xylography; but the earliest that have been preserved are done by hand, while the printed cards date from the 15th century, therefore from a period in which woodcuts were already used for other purposes. Some of the wood engravings and blockbooks are supposed to have been printed in monasteries. In a necrology of the Franciscan monastery at Nördlingen, which comes down to the beginning of the 15th century, this entry occurs: "VII. Id. Augusti, obiit Frater h. Luger, laycus, optimus incisor lignorum"; and on some of the engravings we find the arms of certain monasteries, which may, however, merely mean that they were printed for, not in, those monasteries. The registers of Ulm mention several wood-engravers (*formschneider*)—in 1398 a certain Ulrich; in 1441 Heinrich Peter von Erolzheim, Joerg, and another Heinrich; in 1442 Ulrich and Lienhart; in 1447 Claus (Nicolas), Stoffel (Christopher) and Johann; in 1455 Wilhelm; in 1461 Meister Ulrich, &c. In a register of taxes of Nördlingen we find from 1428 to 1452 a certain Wilhelm Kegeler mentioned as *brieftrücker*; in 1453 his widow is called *alt brieftrückerin*; and in 1461 his brother Wilhelm is registered for the same craft. At Mainz there was a printer, Henne Cruse, in 1440. At Nuremberg we find in 1449 Hans (Spoerer?), a *formschneider*, while his son Junghans exercised the same industry from 1472 to 1490. Hans von Pfedersheim printed at Frankfort in 1459; Lienhart Wolff, *priefdrucker*, is mentioned in the registers of Regensburg of 1463; Peter Schott at Strassburg in 1464. A certain George Glockendon exercised the same trade at Nuremberg till 1474, when he died and was succeeded by a son and afterwards by a grandson. In Flanders a Jan de Printere was established at Antwerp in 1417; and printers and wood engravers (*houte bildsnyters*) worked there in 1442 (*Privileges of the Corporation of St Luke* at Antwerp). At Bruges *printers* and *beeldemakers* (makers or engravers of images) were enumerated in 1454 among the members of the fraternity of St John the Evangelist. The printers of playing cards seem to have constituted a separate class.

All these entries show that long before the middle of the 15th century there were men who exercised the art of wood-engraving and printing as a trade or craft. It seems also certain that wealthy persons and religious institutions were wont to possess sets of blocks, and, when occasion arose, printed a set of sheets for presentation to a friend, or in the case of monasteries for sale to the passing pilgrim. A printer of briefs or blockbooks had no need to serve an apprenticeship;

[1] This title is applied to at least three works: (1) the well-known blockbook, of which we speak below, (2) a treatise "in qua de vitiis et virtutibus agitur," and (3) a work in rhyme by Alexander Gallus.

[2] See Laib and Schwarz, *Biblia pauperum* (Zurich, 1867).

any neat-handed man could print for himself. We learn from the inventory of the possessions of Jean de Hinsberg, bishop of Liége (1419–1455), and his sister, a nun in the convent of Bethany, near Mechlin, that they possessed "unum instrumentum ad imprimendas scripturas et ymagines," and "novem printe lignee ad imprimendas ymagines cum quatuordecim aliis lapideis printis." These entries would seem to indicate that people purchased engraved blocks of wood or of stone from the wood-cutter rather than books from a printer.

Xylo-chirographs. Concurrently with these single woodcuts, with or without written or xylographic text, arose a class of books, in some of which written texts were added to pictures printed from wooden blocks; in others the text was written first, and woodcuts pasted or printed in spaces reserved for them. These books, combining wood-engraving with handwriting, are now in technical language called *xylo-chirographs* (wood-handwritten books); they may also be called semi-blockbooks, and form an intervening stage between the manuscript book and the blockbook (*xylograph*) entirely printed from wooden blocks. They tend to show that xylography, after having been for some time confined to the production and multiplication of insulated pictures, was gradually applied to the printing of whole series of illustrations, to be added to written texts, or to have written texts added to them. It is not possible to assign definite dates to these xylo-chirographs; they could hardly be placed after, but may, for ought we know, be contemporaries of the blockbooks. We know nine of them; the years 1440 (which occurs in No. 5) and 1463 (found in No. 9) marking, for the present, the period within which they can be placed.

(1) *Biblia Pauperum*, in the Heidelberg University Library, German work, MS., Latin text added to engravings (cf. Schreiber, *Manuel*, iv. 90, *c.* 1460; photogr. pl. xlv.); (2) *Anti-christus*, one part of which is in the Paris Bibl. St Gen. (see Bernard, *Orig. de l'impr.* i. 102), another at Vienna, Alb. Bibl.; Bavarian work, MS., German text added to engravings (Schreiber iv. 231, pl. lv.); (3) *Vita et Passio Jesu Christi*, 48 leaves, in the Vienna Hofbibliothek, German work, the woodcuts printed on the versos, Latin prayers written on the rectos (Schreiber iv. 321, *c.* 1450, pl. lxxxx.); (4) *Septem planetae*, seven xylographically printed plates in the Berlin K. K. Library, German work, with German explanatory text written on separate leaves facing the engravings (Schreiber iv. 417, *c.* 1470, pl. cxi.); (5) *Pomerium spirituale*, by Henricus de Pomerio (or Henri Vanden Bogaert), in the Brussels Royal Library, bearing the date 1440 in two places; its twelve engravings seem to have originally been published as a blockbook, without any text (see below);[1] in this copy they are cut up, pasted on other (contemporary) leaves of paper, and a Latin MS. commentary added to them (see Alvin, *Documents iconogr.*; Schreiber iv. 317, pl. lxiv.; Conway, *Notes on the Exercitium super Pater Noster*; Holtrop, *Mon. typ.* p. 9). Some bibliographers unreasonably contend that the engravings cannot be earlier than *c.* 1470, and that the year 1440 is the date of the original, now lost, which the transcriber of this copy inadvertently repeated. (6) *Exercitium super Pater Noster* (ascribed for good reasons to the same Henri Vanden Bogaert); imperfect copy (8 leaves) in the Paris National Library (Invent. D. 1581); woodcuts printed on the recto of each leaf, and an explanatory text (in Flemish) written underneath them (Schreiber iv. 245, pl. lxxxvii.; Conway, *l. c.*); (7) the same *Exercitium*, with the same eleven engravings that were issued, some time before, as a complete blockbook (see below), a copy of which is preserved in the public library at Mons, in which the engravings are cut up and (after the Flemish verses of the block-book had been cut away) pasted, with their versos, on the versos of other contemporary leaves, with an explanatory (Latin) text written on the recto of the leaf next to each engraving (Schreiber iv. 247, pl. lxxxviii.; Conway, *l. c.*; (8) a MS. of the *Speculum humanae salvationis*, with the written date 1461 (Munich Hof.-u. Staatsbibl. cod. lat. 21543), in which the 192 illustrations, usually found in the MSS. of the *Speculum*, have been impressed from small wooden blocks in the spaces reserved for them in the MS.; (9) another MS. of a German version of the *Speculum* in the same Munich library (Cod. Ger. 1126), with the written date 1463, in which the 192 woodcut illustrations, impressed in No. 8, are again impressed in the spaces reserved for them.

Blockbooks of German Origin. Of blockbooks of probable German origin the following are known:—

1. *The Apocalypsis*, or *Historia S. Johannis evangelistae ejusque visiones apocalypticae* (Germ. *Das Buch der haymlichen Offenbarungen Sanct Johans*).—Of this work six or seven editions are said to exist, each containing 48 (the 2nd and 3rd edition 50) illustrations, on as many anopisthographic leaves, which seem to have been divided into three quires of eight sheets each. The first edition alone is without signatures. Cf. S. L. Sotheby, *The Blockbooks*, i. 1. A copy of the 5th edition (according to W. L. Schreiber, *Manuel*, iv. 168), 48 leaves, is in the Cambridge University Library. A copy of the supposed 4th edition in the British Museum (C. 9, c. 1), and one of the 6th edition (IB. 14); also a single leaf (with signature H) of the 5th edition (IB. 16).

2. *Ars moriendi.*—Although the origin of this work must be ascribed to the Netherlands, some authors think that there are early German editions, among others that spoken of below as the 2nd Dutch edition. Certainly German is the edition of Hans Spörer of Nuremberg (1473), in the public library at Zwickau, and a fragment of leaf 18, in the British Museum (IB. 20); another by Ludwig zu Ulm, in the Paris National Library, and the one described in *Collectio Weigel.* (ii. 16), where also other, but opisthographic, editions are described (see Sotheby i. 70; Schreiber iv. 253). A copy of one of these in the British Museum (IA. 24). A copy of an edition printed in a press and ascribed to Augsburg, in the British Museum (IB. 23).

3. *Ars memorandi quatuor evangelia*; 30 leaves, folio, printed on one side, 15 leaves being letterpress and 15 plates (Sotheby ii. 2; Schreiber iv. 135). Copy in the British Museum (IB. 17).

4. *Salve Regina*, bears the name of its engraver, Lienhart czu Regenspurck; 16 leaves; 2 leaves (signature *a*) are wanting in the only copy known of it, which was in the Weigel collection (ii. 103) and is now in the British Museum (IB. 1); Schreiber iv. 381.

5. *Vita et Passio Christi* (German); 32 leaves, small 8vo. Two copies in the Paris Library (Sotheby ii. 143; Schreiber iv. 320, who describes other issues in German and Italian).

6. *The Ten Commandments for Unlearned People* (*Die Zehn Bott für die ungelernte Leut*).—Ten leaves in the library at Heidelberg bound up with MS. No. 438; see Joh. Geffcken, *Bildercatechismus* (Leipzig, 1855), 4to; Sotheby ii. 160; W. L. Schreiber iv. 234.

7. *The Passion of our Lord*; 16 leaves in the Weigel collection (Sotheby ii. 141; Schreiber iv. 320), now in the British Museum (IA. 25).

8. *The Antichrist* (*Der Enndchrist*); 26 leaves, small folio (Sotheby ii. 38; Weigel ii. 111; Schreiber iv. 217). Copies in the Manchester Rylands Library (Spencer collection); Coll. Weig. No. 264, leaf 6 and the upper half of 7 now in the British Museum, where also a fragment of leaf 28 is preserved; four copies at Munich.

9. *The Fifteen Signs of the Last Judgment*; 12 engravings, usually bound up with the engravings of *The Antichrist* (Sotheby ii. 42; Schreiber iv. 217). Copies as of No. 8. An edition was also published at Nuremberg in 1472 by Jung hannss Priffmaler (copy at Gotha).

10. *Symbolum Apostolicum*; small 4to, 7 leaves printed on one side only, containing 12 woodcuts. Cf. Sotheby ii. 148; also Schreiber iv. 239, who describes three editions: (1) at Vienna; (2) at Heidelberg; (3) with German inscriptions, at Munich.

11. *The Legend of St Meinrad*; 48 leaves. Copies in the libraries at Munich and Einsiedeln (Sotheby ii. 150; Schreiber iv. 385).

12. The *Acht Schalkheiten*, of which 8 leaves were in the Weigel collection (i. 112; Sotheby ii. 154).

13. The *Fable of the Sick Lion*; 12 leaves. Copies in the Berlin Museum, and in the Heidelberg Library (No. 438). Cf. Sotheby ii. 159, pl. lxxxvi.; Schreiber iv. 444.

14. *Defensorium Inviolatae Virginitatis b. Mariae Virginis*; 16 leaves, folio, with the initials of the printer F(riedrich) W(althern) and the date 1470 on the first leaf (Schreiber iv. 368; Sotheby ii. 63). Copies in the British Museum (IB. 2); two at Paris; three at Munich; one at Berlin; another at Stuttgart.

15. The same work, 27 leaves, large folio, 1471, with the imprint "Johannes eysenhüt impressor (at Regensburg) Anno ab incarnacōis dnice M° quadringentesimo septuagesimo j°" (cf. Sotheby ii. 72; Schreiber iv. 374). Copies in the British Museum (IC. 4), at Berlin, Gotha, Manchester.

16. *The Dance of Death* (*Dance Macabre*; *der Doten Dantz*); 27 leaves; two editions; one in the library at Heidelberg; another at Munich (cf. Schreiber iv. 432; Sotheby ii. 156).

17. *Die Kunst Ciromantia* of Dr Johan Hartlieb (Sotheby ii. 84; Schreiber iv. 428). Ten leaves of the edition of Jorg Schapff of Augsburg *c.* 1478 in the British Museum (IB. 8).

18. *Der Beichtspiegel* or *Confessionale*; 8 engravings (Sotheby ii. 145; Schreiber iv. 252). Copy in the royal library (Mus. Meerman) at the Hague.

19. *Exercitium super Pater Noster*, only one leaf (the first) preserved at Kremsmünster, of a German edition (Schreiber iv. 247). For two xylo-chirographic issues of this Netherlandish work, see above, and below for a xylographic edition.

20. *Biblia Pauperum*, German text; copy in the British Museum (IB. 3); and a copy of another edition (40 leaves) with the device of Hans Spoerer, and the date 1471 (IC. 5).

21. *The Apostles' Creed*; 7 leaves, folio. Copy at Wolfenbüttel.

22. The *Credo*, in German; 12 leaves, 4to. Copy in the Munich Royal Library.

[1] Dumortier testifies to having seen a copy of the engravings unaccompanied by MS. ("Notes sur l'imprimerie," in *Bull. Acad. Roy. de Belg.*, 1841, vol. viii.).

23. *Propugnacula, seu Turris sapientiae* (Sotheby ii. 164). One sheet, plano, in the British Museum (IC. 30). It may have originated in the Netherlands.

Blockbooks of Netherlandish origin are:—

Of Netherlandish Origin.

1. *Apocalypsis S. Johannis.*—Copy in the Haarlem Town Library. A copy of the 3rd (?) edition, of 50 leaves, in the British Museum (IC. 40), the leaves 36 and 38 having been supplied from another copy. Leaf 21 of another copy in the same library.

2. *Biblia Pauperum*; 40 folio leaves (each bearing a signature: *a* to *v*; *.a.* to *.v.*). As many as seven editions have been distinguished by Sotheby (i. 43), Holtrop (*Mon. typ.* p. 3), and ten by Schreiber (iv. 1), who likewise mentions a Latin edition of 50 leaves, besides the two editions with German texts of 1470 and 1471. The British Museum Catalogue of 15th-century books enumerates copies or fragments of copies of seven editions.

3. *Speculum humanae salvationis.*—Of this work a blockbook must have existed, of which only 10 sheets (= 20 leaves) with woodcuts and texts, besides 12 isolated woodcuts (used in 1483), have come down to us. We speak of it at length below when dealing with the typographic editions known of this work.

4. *Ars moriendi*; 24 leaves, small folio, 13 containing text, 11 plates. See above (German) No. 2; Sotheby i. 69; Holtrop, p. 8; Schreiber iv. 253, who enumerates thirteen editions, some of which are German.[1] The theory, started a few years ago, that the engravings of this blockbook are imitations of the sketches by the master E. S. (see M. Lehrs, *Der Kunstler der Ars moriendi*, 1890; L. H. Cust, *The Master E. S.*, 1898) is wholly inadmissible. Copy in the British Museum (IB. 18), and an imperfect one in the Haarlem Town Library.

5. A copy of another edition of 24 leaves in the British Museum (IA. 19).

6. *Canticum Canticorum*; *Historia seu Providentia B. Virginis Mariae ex Cantico Canticorum*; 16 leaves in folio, two editions (Sotheby i. 77; Holtrop, p. 6; Schreiber iv. 151). Copies in the Haarlem Town Library (wanting the leaves 3, 4, 7, 11, 13, 15, 16); the British Museum (IB. 46), which possesses also a copy of another edition (IC. 47).

7. *Liber Regum, seu Historia Davidis*; 20 leaves. folio (Sotheby i. 120^b; Schreiber iv. 146). Some consider this to be a German work.

8. *Exercitium super Pater Noster*, by Henricus de Pomerio or Henry Vanden Bogaert; 10 leaves, small folio (Sotheby ii. 137; Holtrop p. 10; Conway, *Notes on the Exercitium*, 1887; Schreiber iv. 245). For other editions see the two preceding sections.

9. *Pomerium Spirituale*, by the same author as No. 8; 12 leaves, having 12 woodcuts. This blockbook is now only known from a xylo-chirographic issue with the MS. date 1440 (see above), preserved in the Brussels Royal Library. See Conway, *Notes on the Exercitium.*

10. *Temptationes Demonis temptantis hominem de septem peccatis mortalibus*; a single large folio leaf printed on one side (Sotheby i. 122^a; Schreiber ii. 249). One copy in the British Museum (IC. 29), another in the Wolfenbüttel Library.

11. *Vita Christi*, or *The Life and Passion of Christ*; 36 cuts, originally printed in a press on six anopisthographic leaves, in 8vo. Copy in the Erlangen Library (Campbell, *Annales*, 746).

12. *Historia Sanctae Crucis*; a fragment of one leaf (with signature *g*), formerly in the Weigel Collection (ii. 92), but now in the museum at Nuremberg; it seems to be only a proof-sheet.

13. Alphabet (grotesque) in figures (Holtrop p. 11; Sotheby i. 122; Schreiber ii. 324–327).—There is one copy in the British Museum and another in the Basel Library, the latter having the date 1464 engraved on the letter A, which is mutilated in the Museum copy. A similar alphabet preserved at Dresden seems to be a copy made in Germany.

14. *Donatus* (*Aelius*) *de octo partibus orationis.* Leaf 6 of an edition *c.* 1500 of 16 leaves in the British Museum (IA. 48). For other xylographic editions of this work cf. Holtrop, *Mon. typ.*

Besides the works of Sotheby, Holtrop, Weigel, Schreiber, Lehrs, Cust, &c., quoted above, consult Sir W. M. Conway, *The Woodcutters of the Netherlands in the 15th Century* (Cambridge, 1884); Heinecken, *Idée générale* (Leipzig, 1771); J. Ph. Berjeau's *Facsimiles of the Biblia Pauperum, Canticum Canticorum, Speculum* (London, 1859–1861), and idem, *Catal. Illustré des livres xylogr.* (London, 1865); Dodgson, *Cat. of Early German and Flemish Woodcuts in the Brit. Mus.*

Early Printing with movable Metal Types.—When the art of writing, and that of printing from wooden blocks (xylography), and all the subsidiary arts of illuminating, decorating and binding manuscripts, books, pictures, &c., were at their greatest height, and had long passed out of the exclusive hands of the monasteries into the hands of students and artisans, the art of printing with movable cast-metal types (typography) was invented. As to when, where and by whom this invention came about, a dispute has been waged for more than four hundred years. It will be seen below that we must attribute it, as in our former edition, to Lourens Janszoon Coster, of Haarlem, and not to Johan Gutenberg, of Mainz.

Invented at Haarlem.

The Claims of Germany.

In saying this, we are aware that in the year 1900 (exactly four hundred years after the *Cologne Chronicle* had publicly started the dispute by saying that Gutenberg had *improved* but not *invented* the art) Germany enthusiastically celebrated the supposed 500th anniversary of his birthday. The speeches delivered on that occasion, after making faint allusions to the doubts and opposition of former times, all declared that, after the rediscovery of the Helmasperger document of 1455, which could not be found in 1880 (Hessels, *Gutenberg*, pp. 99-101), it was impossible for any unbiased person to dispute Gutenberg's claims to the honour of the invention any longer.

In the same year a Gutenberg Museum was erected at Mainz to be a repository for anything connected with Gutenberg and printing; also a Society (*Gutenberg-Gesellschaft*) founded with the view of publishing any book that related, however remotely, to Gutenberg and his invention, to which the whole civilized world was invited to subscribe, as its object was to honour the genius who had conferred such an inestimable boon on mankind by his invention. As a first result, a "Festschrift" was published containing an historical introduction by Professor Hartwig; and articles on the first steps to typography (Schreiber); stamp-printing before Gutenberg and the Psalters of 1457, 1459, &c. (Falk); 15th-century printing in France (Labande); German printers in Spain and Portugal (Häbler); German printers in Italy (Marzi); the coloured initials in Fust and Schoeffer's Psalter (Wallau); the Turkkalendar for 1455 (Wyss); the earliest spread of typography (Velke); also an elaborate pedigree of the family Gänsfleisch (Schenk zu Schweinsberg), and an equally full account (by Schorbach) of all the documents related to Gutenberg. This "Festschrift" was followed by publications of the "Gutenberg Society": I. (1902) *Die älteste Gutenberg type* (Zedler); II. (1903) *Die Donat- und Kalendar type* (Schwenke); III. (1904) *Das Mainzer Fragment vom Weltgericht* (Schröder, Zedler, Wallau); IV. (1905) *Das Mainzer Catholicon* (Zedler); V., VI., VII. (1908) *Das Mainzer Fragment vom Weltgericht* (Schröder); Die B^{42} type *im Schöfferschen Missale Mogunt. von 1493* (Zedler); *Die Missaldrucke P. Schöffers und seines Sohnes Johann* (Tronier); *Zu den Büchheranzeigen Peter Schöffers* (Velke).

We admit the great value of these learned and painstaking publications, and those who have the time and patience to study the mass of material here brought together in a somewhat bewildering fashion, will find their knowledge enriched on various subjects connected with early printing, but no proofs that Gutenberg invented it. It is clear from these books that their authors firmly believed from the outset that Gutenberg invented printing, and printed nearly every book that appeared or can be placed before his death in 1468. Under this impression they always speak of him as the "great master," the "great genius," &c., and represent him, not as inventing printing by accident, but as conceiving, somewhere about 1436 or earlier, the idea of inventing it, and meditating from that moment over the problems which he had to solve. Consequently, our authors read a good deal between the lines of their documents, which we fail to find there, and in this way the texts of the documents always show somehow that "the great master" is making or has already made his invention. For instance, the Strassburg lawsuit of 1436–1439 is to them an unimpeachable proof that Gutenberg was secretly working there at printing and trying to solve his problems; when he is paying there, during the same time, a considerable sum in duties for large quantities of wine, we are told that he was then in good circumstances; but when he borrows money in 1442, 1448, 1450 and 1452, and is summonsed in 1455 for not repaying the two last loans, and prosecuted in 1457 for not paying the interest due on his first debt, it is all owing to his difficulties in working out the problems of his invention, though the documents themselves never allude to any "invention" and may be interpreted in quite a different way.

We proceed to examine the documents. The earliest mention and description of the new art is perhaps that in the *Donatus* issued

[1] Heinecken enumerates six editions, of which one has German inscriptions. See also an article by Guichard, in *Bull. du Bibliophile* (Paris, 1841).

Earliest Definitions of Printing.

by Peter Schoeffer at Mainz before 1456, which, according to its colophon, was finished "Arte nova imprimendi seu caracterizandi (from *character* = letter) . . . absque calami exaratione." Fust and Schoeffer said of the Mainz Psalter of 1457 that it was formed by an "adinventio artificiosa imprimendi ac caracterizandi absque calami ulla exaratione." The colophon of the *Catholicon* of 1460 says that the book was printed "non calami, stili, aut pennae suffragio, sed mira patronarum formarumque concordia, proporcione, ac modulo." In 1462 Albrecht Pfister says that he had "gedrucket" the *Four Histories*. Fust and Schoeffer say of the *Liber Sextus Decretalium*, published in 1465, that it was completed "non atramento ("atramento communi" in the Justinianus of 1468 and 1472), plumali canna neque aerea, sed artificiosa quadam adinventione imprimendi seu caracterizandi," which phrase they slightly varied in Cicero's *Officia*, issued in the same year: "non atramento, plumali canna neque aerea, sed arte quadam perpulcra." The edition of St Jerome's *Epistles* of 1470 is said to have been completed by an "ars impressoria," the *Decretum Gratiani* of 1472 by an "ars quaedam ingeniosa imprimendi," the *Dyalogus* of 1478 by an "ars magistra." We find further—"ars sancta" or "divina," "nova ars scribendi," "novum exscribendi genus prope divinum," "sculptoria archetyporum ars," "ars mirifica formandi," "ars excusoria," "nova imprimendi ratio," "ars pressurae," "chalcotypa ars," "chalcographia" (1472 and later), "chalcographia excusoria impressoriaque," "libraria impressio," "empryntynge" (Caxton, 1482), "prenterei" (Schoeffer, 1492), "truckery" (1505), "impression des livres" (1498), and "prenten."

Printers.

The early printers called themselves, or were called by others, "librorum prothocaragmatici" (*Gramm. Rhythm.*, 1468), "impressores librorum," "exsculptor librorum" (Jenson, 1471), "chalcographus" (1473; Hain 13036), "magister artis impressoriae," "boeckprinter"; and during the 16th century we find them still frequently called "chalcotypus" and "chalcographus."

Types.

The types were at first designated more by negative than positive expressions. In 1468 they were called "caragma," later on "caracter" or "character," "archetipae notae" (1473; Hain 13036), "sculptoria archetyporum ars," "chalcotypa ars," "formae," "artificiosissimae imprimendorum librorum formae." We soon hear also of the process and material by which they were produced. The *Grammatica* of 1468, published by Schoeffer, says that it was "cast" (sum fusus libellus). In 1471 "aeneae formulae" are spoken of; and Bernardus Cenninus and his son testify that they had printed the Virgil "expressis ante calibe caracteribus et deinde fusis literis" (with letters first cut into steel and then cast). In 1473 Friedrich Creusner at Nuremberg states that he had "cut" (sculpsit) the work of Diogenes (Hain 6192). Johan Zeiner of Ulm says in 1474 that he had perfected a book, not with the pen, but with letters of metal (stagneis caracteribus). In 1474 Joh. Ph. de Lignamine speaks of "metallicae formae." In 1476 Husner of Strassburg represents the Nider as being printed with "letters cut of metal (litteris sculptis artificiali certe conatu ex aere)." Nicolas Jenson printed in 1480 with letters "cut and cast" (sculptis ac conflatis).

Word "Typography."

The word *typographus* seems to occur for the first time in 1488, in the preface of P. Stephanus Dulcinius Scalae to the *Astronomicon* of Manilius, printed in that year at Milan by Antonius Zarotus;[1] in 1498 Erasmus uses it in a letter (dated Feb. 13) to Christianus, a Lübeck merchant;[2] and in 1517 Johan Schoeffer applies the word to himself in the colophon of the Aeneas Sylvius published by him. But of the use of the word *typographia* no earlier instance is known than 1520, in which year Gerardus Noviomagus (=Geldenhaurius) in his *Lucubratiuncula de Batavorum Insula* (pref. to Nicol. Buscoducensis, dated 1520) says: "inventa Germanorum . . . bombarda videlicet, typographia, pyxis chartaque nautica"; and Johan Schott, a printer of Strassburg, in the *Geogr. Ptolem.* published by him, describes his grandfather, Johan Mentelin, as "primus typographiae inventor." Gerardus, it may be added, borrowed the whole passage from Pet. Montanus (li. 1 *Adag.*, published *an.* 1504), who has chalcographia instead of typographia. Meerman indeed[3] speaks of a use of the word typographia (or at least of typographus) earlier than 1520, and refers to the preface of Bernardinus Veronensis in the edition of Tibullus, Catullus and Propertius published at Venice in 1493 by Symon Bevilaqua, "at least," Meerman adds, "as it (the preface) is read in the *Annal. typogr.* of Maittaire, i. 560, 2nd ed." But on page 560 Maittaire quotes the first two lines of Bernardinus's preface (till *dicit*) and then adds: "Graecis characteribus destitutus, typographus necesse habuit hiatus in commentario hic illic relinquere," which is evidently Maittaire's own remark, not that of Bernardinus. The present writer at least has been unable to find such a passage in the Tibullus.

When we, for the moment, leave out of sight the question as to when, where, and by whom the art was invented, and take our stand on well-authenticated dates in such printed documents as have been preserved, we find that the first printed date, 1454, occurs in two different editions of the same letter of indulgence issued in that year by Pope Nicholas V. in behalf of the kingdom of Cyprus.

Nicholas V.'s Indulgence of 1454.

These two editions bear no printer's name, nor the place of printing, but are distinguished respectively as the 31-line and the 30-line Indulgence. The one with 31 lines claims priority,[4] from a chronological point of view, over the one with 30 lines, because one of the sold copies that has been preserved was issued at Erfurt on the 22nd of October 1454 (in the possession of Herr Ernst Fischer at Weinheim, *Centralbl.*, 1909, p. 30); a second (in the Hanover Archives; *Veröffentl.* II. tab. i.) at Fritzlar on the 12th of November 1454; a third (in the Mus. Meerman, at the Hague) at Erfurt on the 15th of November 1454, &c., whereas of the 30-line Indulgence the earliest sold copy that has as yet come down to us was issued at Cologne on the 27th of February 1455, though it has the printed date mccccliiii., which was altered with the pen to mccccliiiij. In the 31-line Indulgence occur (*a*) a large church type used for the headings and commencing words of the absolutions, for the first word in the document and for the Christian name of the pope's legate; (*b*) a smaller text or brief type for the text; (*c*) a large initial V and two large initials M, which slightly differ from each other. In the 30-line Indulgence occur (*a*) a large church type, used as in the 31-line Indulgence; (*b*) a smaller text or brief type for the text; (*c*) a large initial U, and two large initials M differing from each other.

Mainz Printing.

These two different editions are usually regarded as having been printed at Mainz; and, in the absence of any evidence to the contrary, we assume that such really was the fact. But we must at the same time conclude that about October 1454 there were at least two rival printers at work there: (1) the printer of the 31-line Indulgence, who may have been Johan Gutenberg, perhaps subsidized by Johan Fust; (2) the printer of the 30-line Indulgence, who was no doubt Peter (Schoeffer) de Gernssheym, as this Indulgence is connected with one of 1489 printed by him. Four *written* copies of this 1454 Indulgence are known to exist which respectively bear the dates: Frankfurt, 10th April 1454 (in the possession of Herr Lais, Wiesbaden); Frankfurt, 11th April 1454 (Frankfurt Archives); 11th July 1454 (place unknown; Darmstadt archives); Lübeck, 6th October 1454. As their dates precede by a few weeks only the earliest known date (Oct. 22, 1454) on a printed copy, they mark, perhaps, the exact time when printing made its appearance at Mainz, in an already advanced state of perfection.

Basing ourselves on the above Indulgences with their printed date, and four different types, we subjoin two lists of the books which the German bibliographers of the present day regard as having all been printed by Johan Gutenberg at Mainz, in the types or "developments" of them, employed for these Indulgences. They are arranged in two columns (A and B) according to types, but without regard to strict or supposed chronology. For further details cf. Hessels, *Gutenberg* (1882), p. 150 sqq.; Schwenke, *Berlin Festschr.* (and in the *Veröffentl.* of the Mainz Gutenberg-Gesellsch.); Zedler (*Gutenberg-Forsch.* and in the *Veröffentl.*), &c.

A.

Types: I (large church type, also called the 36-line Bible type) and II (smaller brief type), used by an unknown printer, not later than October 1454.

i. 31-line Indulgence; three different issues (A, B, C), with the printed year mcccclіiii., and one issue (D) with the printed year mccccly. All printed on vellum. Of issues A and B no sold copies have yet come to light; but three unsold copies of each are preserved at Brunswick, Wolfenbüttel and Hanover (Culemann coll.). Of issue C ten sold copies are known to exist in various libraries with dates ranging from the 22nd of October 1454 to April 1455, besides three unused copies. Of issue D ten sold copies with dates from the 7th of March 1455 to the 30th of April 1455 and four unused copies are known.

B.

Types. III (large church type, somewhat smaller than Type I, also called the 42-line Bible type) and IV (a smaller brief type), used by Peter Schoeffer de Gernssheym (1454–1455).

i. 30-line Indulgence; one issue (A) with the printed year mcccclіiii., and two issues (B, C) with the printed year mccccl-quinto. All printed on vellum. Of issue A only one copy has been discovered (now in the Rylands-Spencer Library), which was sold at Cologne on the 27th of February 1455, the printed date mcccclіiii having been altered with the pen to mccccliiiij. Of issue B two sold copies, with dates April 11 and 29, 1455, are in the Berlin Library and the British Museum. Of issue C a sold copy with date April 24, 1455 is at Wolfenbüttel.

[1] Maittaire, *Annales Typogr.* i. 508, note 1.

[2] *Opp.* iii. col. 24.

[3] *Origg. Typogr.* i. 32, note *cx*.

[4] No inferences can be drawn from this priority, as it merely rests on the date of a sold copy that has come to light.

A (*contd.*).

Type I continued; for type II. (of which no further trace is found) see below.

ii. Poem on the "Weltgericht." Fragment of one leaf (paper), discovered at Mainz about 1892, preserved in the Gutenberg Museum at Mainz; presumed to have been printed *c.* 1443–1444.

iii. *Donatus*, 27 lines. Fragments of 4 vellum leaves (4, 5, 8, 9) recently discovered in the Heiligenstadt Library, and now preserved in the Berlin Royal Library.

iv. *Donatus*, 27 lines. Two rubricated vellum leaves (5 and 10) of an edition of 14 leaves, usually called the *Donatus* of 1451, preserved in the Paris National Library.

v. *Donatus*, 27 (?) lines. Two strips of vellum leaves, containing the remains of 3 lines and about 30 mutilated letters, discovered in the Heiligenstadt Library, and now in the Berlin Royal Library.

vi. *Astronomical Kalendar*, said to be for the year 1448, therefore supposed to have been printed at the end of 1447. Fragments of two large vellum rubricated sheets, printed on one side, discovered in 1901 in the binding of a MS. belonging to the monastery of Schönau, near Mainz, now preserved in the Wiesbaden Landesbibliothek.

vii. *Donatus* of 18 leaves, 26 lines, on vellum; of which 2 rubricated sheets (4 leaves, 1, 2, 9, 10) are preserved in the Berlin Royal Library; probably issued between 1447 and 1450 (*Centralbl.* xxvii. 65 sqq.).

viii. *Manung widder die Durken.* An almanac for January 1455, in 4to, 5 paper leaves, 20 and 21 uneven lines. A unique copy, discovered at Augsburg, now in the Munich Hof Library.

ix. A German translation of the bull of Pope Calixtus III., dated XII. Kal. Julii (=Jun. 20) 1456. Fourteen rubricated leaves 4to, in the *Kalendar* type, except that two of the capital E's belong to the B^{36} type (13b and 14 blank), preserved in the Berlin Royal Library; not to be ascribed to P. Schoeffer (*Centralbl.* xxvii. 63).

x. *Conjunctiones et oppositiones solis et lunae* (now called by German bibliographers Laxier-Kalendar). A calendar for 1457, a broadside paper sheet, printed on one side, of which the upper half of the only copy known, discovered at Mainz, is in the Paris Library.

xi. *Der Cisianus* (not Cislanus) *zu Dutsche.* A broadside paper sheet, 36 lines, printed on one side, with separate headline. The Tross-copy mentioned in suppl. to Brunet's *Manuel* (1878, *sub voce* "Cislanus") was bought in 1870 for the Cambridge University Library.

xii. *Donatus*, 27 lines, 14 vellum leaves, of which the British Museum possesses the leaves 4, 10 and 11 (entire) with fragments of the leaves 2, 6–9 and 13. A fragment of 6½ lines in the Bodleian Library and two small fragments discovered in the library at Heiligenstadt.

xiii. *Donatus*, 27 lines, which Schwenke calculates to have consisted of 14 vellum leaves, of which the leaves 6 to 9 are now in the Berlin Royal Library.

xiv. *Donatus*, 27 lines. Three strips of a rubricated vellum leaf 5 discovered in the Karlsruhe Hof-Bibliothek.

xv. *Donatus* 27 lines. One rubricated vellum leaf (6), in the *Kalendar* type, in the Berlin Library (*Centralbl.* xxvii. 62)

xvi *Donatus*. 27. 28 or 30 (?) lines. Fragments of two vellum leaves of an edition of 12 (?) leaves discovered in the binding of a book (printed at Milan in 1476) which formerly belonged to the Episcopal Library at Salzburg, and is now in the Munich Hof-Bibliothek.

xvii. *Donatus*, 27 (or 30?) lines. Vellum fragments of an edition of 12 (?) leaves in the British Museum (C. 18. e. 1 No. 5). Leaves 1 and 2 are in the Bodleian Library, and leaf 8 in the Mainz Town Library.

xviii. *Donatus*, 27 lines. Fragment of a vellum leaf (3?) discovered in the binding of a MS. in the Munich Hof-Bibliothek.

xix. *Donatus*, 27 lines. Two vellum fragments of the leaves 6 + 9, the upper part of which is preserved in the Bodleian Library (Auct. 2 Q infra I. 50 No. 6), the lower part in the Bamberg Royal Library (VI. F 1).

xx. *Donatus*, 28 (?) lines. One defective vellum leaf, showing 25 lines, formerly in the possession of Jacq. Rosenthal (*Incun. typ.* ii. No. 2154), afterwards in the Amherst collection (Handlist No. 5). Another leaf in the Mainz Gutenberg Museum.

xxi. Bible of 36 lines (referred to everywhere as B^{36}), 2 vols., folio, 882 leaves, with 2 columns of 36 lines each on a page. Some bibliographers, assuming that Pfister printed it, call it the Pfister Bible. A paper copy of it is in the Paris Library, and also a separate copy of the last leaf, which bears the MS. date 1461. Other copies are preserved in the Rylands-Spencer Library, in the British Museum, at Jena, Leipzig, Antwerp, &c. (Hessels, *Gutenberg*, p. 160; Bernard, *Origine*, ii. 31).

B (*contd.*).

Type III continued (till about 1457; of Type IV no further trace is found).

ii. *Donatus*, of 35 lines, folio, printed, according to the colophon, "per Petrum de Gernssheym in urbe Moguntina cum suis capitalibus."

iii. Bible of 42 lines (also called Mazarine Bible and referred to below as B^{42}), printed before the 15th of August 1456, as the binder of the paper copy in the Paris Library states that he finished its rubrication on that day. Two volumes folio, 641 leaves in 2 columns of 42 lines each, though in some copies the columns of pp. 1 to 9 contain 40 lines only, while the 10th page has 2 columns of 41 lines each, the difference in the number of lines making no difference in the space which they occupy. For other copies see Hessels, *Gutenberg*, p. 170; Dziatzco, *Beitr. zur Gutenbergfrage* (Berlin, 1889); Schwenke, *Festschr.*, who has drawn up a list of all the copies known to be still in existence. The copy known as the Klemm copy, which was bought by the Saxon Government in 1886, and presented to the "Deutsches Buchgewerbemuseum" at Leipzig, has the year "1453" written in small Arabic numerals of 15th-century form at the bottom of the last leaf of the second volume. But this date is highly suspicious, for Klemm, who must have known its importance and high value, never mentioned it, though he described his copy three times, in 1883 and 1884.

iv. *Donatus* of 33 lines. Vellum fragment at Oxford, without printed initials.

v. *Donatus* of 33 lines. Vellum fragment at Paris, without printed initials; also three rubricated leaves (5, 6 and 8) in the Berlin Royal Library (*Centralbl.* xxvii. 68).

vi. *Donatus* of 33 lines. Leaf 1 (defective) on vellum, mentioned in Ludw. Rosenthal's Cat. 105, No. 3, and purchased by the Berlin Royal Library, which has also acquired the leaves 1 and 11 (*Centralbl.* xxvii. 69.). The large Psalter initials are used for the initials of chapters.

vii. *Donatus* of 33 lines. Leaf 1 (vellum) discovered in the Berlin Royal Library.

viii. *Donatus* of 33 (?) lines. Small fragment, discovered in the library at Giessen, of a vellum leaf, which Schwenke thinks may be the 10th of an edition which differs from Schoeffer's 35-line edition, and also from the Paris 33-line edition.

ix. *Donatus* of 26 lines. One defective vellum leaf, discovered in a Munich private library, and now in the Mainz Gutenberg Museum.

x. *Donatus* of 26 lines. One vellum leaf at Mainz, another at Hanover, a third in the British Museum.

xi. *Donatus* of 24 (?) lines, between 1470 and 1477 (Schwenke).

xii. *Cantica ad Matutinas*; only known from one vellum leaf (the first) in the Paris Library, considered to be the remains of a Psalterium, for the printing of which Humery may have furnished (!) the type (Schwenke *Untersuch.* p. 72 seq.). Judging from the leaf preserved, the work corresponds in every respect to the 42-line Bible, having double columns 42 lines. &c.

Type V.—The "first stage" of Type VII., supposed by Otto Hupp (*Ein Missale Spec.*) and others to have served for printing (1) a *Missale speciale*, in the possession of Ludw. Rosenthal at Munich; (2) a *Missale abbreviatum* discovered in 1900 in the Benedict Church of St Paul in the Lavantthale.

Type VI.—The large type for the Psalter of 1457.

Type VII.—The small type for the same Psalter ("second stage" of Type V). Types VI and VII were also used for the "Canon Missae" of 1458, a copy of which is preserved in the Bodleian Library.

Type VIII used for (1) Joannis de Balbis *Catholicon* of 1460. Large folio, 373 leaves, with two columns of 66 lines each on a page; (2) Matth. de Cracovia, *Tractatus racionis*, 22 leaves with 30 lines to the page, 4to; (3) and (4) Thomas de Aquino, *Summa de articulis fidei*, two 4to editions, one of 13 leaves with 34 lines to the page; the second of 12 leaves with 36 lines to the page; (5) an Indulgence of 1461 of 15 lines (see Hessels, *Gutenberg*, p. 171 sqq.)

The above eight types and the books printed with them (besides a few others printed by Albrecht Pfister at Bamberg) are the only ones that bear, more or less closely, on the question regarding the introduction, or possible invention, of printing at Mainz.

Till recently the church type 1, of the 31-line Indulgence, had always been regarded as identical with that of B^{36}, and the church type 3, of the 30-line Indulgence, with that of B^{42}. But, as the capital P of Indulgence^{30} seems not to occur in B^{42}, and on examination minute differences show themselves in other respects, identity between the two types cannot be accepted. The use of the brief type 2 of Indulgence^{31} seems to have been limited to printing this one document, as its great resemblance to the type employed at Eltville in 1472 for printing a *Vocabularius ex quo*, and Thomas Aquinas' *Summa de articulis fidei*, amounts not to identity. Nor has any further trace been found of the brief type 4 of the Indulgence^{30}, so that the four types used for the two Indulgences were, perhaps, specially manufactured for them and discarded afterwards or melted down for other types.

Hence there is nothing to connect these two broadsides with any locality or any printing-office, except that one of the initial M's of the Indulgence[30] re-occurs as the initial M of the second absolution of a 33-line Indulgence of 1489, which was unquestionably printed by Peter Schoeffer at Mainz, for "Raymundus Peyraudi archidiaconus Alniensis in ecclesia Xanton," who issued it at the order of Pope Innocent VIII., "pro tuicione orthodoxe fidei contra Turchos." For this reason types 3 and 4 and the books printed with them, including B[42], must all be ascribed to him, all the more as he printed, with the type of B[42], the 35-line Donatus, which bears his name in the colophon. As Schoeffer, in the colophon of this *Donatus* (ii.) which bears his name, says that it was printed "cum suis capitalibus," and as these capitals gradually disappear after 1459 and the type of the 42-line Bible is no longer found after 1456, we must presume that some of the twelve incunabula mentioned above (in col. B) were printed by Peter Schoeffer alone before he entered (in 1457) into partnership with Johan Fust (see Hessels, *Gutenberg*, p. 166 seq.).

During the last two decades, however, the two types (3 and 4) and most of the books mentioned above in column B, including B[42], together with the two types (1 and 2), and several of the books in column A, including B[36], have been attributed by German bibliographers to Gutenberg. This singular proceeding is chiefly owing to the late Dr Dziatzko's treatises (*Beiträge zur Gutenbergfrage*, 1889; *Gutenberg's früheste Druckerpraxis*, 1890) on Gutenberg's supposed work as a printer. This author, noticing that the two types of B[36] and B[42], their signs of contraction, marks of punctuation, &c., though differing in size, closely resemble each other in form, concluded that they were manufactured in one and the same office, by one and the same printer, that is, Gutenberg. He thought his conclusion confirmed by the two Bibles being printed on the same kind of paper showing the same watermarks, and arranged in quires in the same way, and divided off into parts at the same place. Finally, from a misprint in B[42] being rectified in the Stuttgart copy of B[36] by a cancel (*Druckerpraxis*, p. 95), he concluded: (*a*) that B[36] was a reprint of B[42]; that the latter was printed by Gutenberg during his partnership (1450–1455) with Fust, who supplied the money and the material, while he himself superintended the manufacture of the type, instructed the compositor and printer, and therefore was its printer; and that the type came afterwards into Schoeffer's possession; (*b*) as B[42] was Gutenberg's first work, and had been begun in 1450, B[36], a reprint of it, could not be dated before this year; but as its type already existed in 1454 (in the Indulgence[31]), Gutenberg, foreseeing his quarrels with Fust, must have been preparing it since 1453, and have printed with it, first, some *Donatuses*, the Indulgence[31], &c., and finally B[36], with the technical and financial assistance of Albrecht Pfister who, shortly before 1458, acquired its type and printing-material (see further, Hessels, "A Bibliogr. Tour," in *The Library*, July 1908). Dr Dziatzko, noticing also a "resemblance" between the types and the workmanship of the two Indulgences, attributed both these broadsides likewise to Gutenberg.

His conclusions, and the method of research by which he reached them, the German bibliographers of the present day have adopted and amplified into a bibliographical and typographical "system," which professes to examine minutely the form and size of every letter, capital or small; the combined letters like *do* and *de* cast on one type; the signs of contraction above, or by the side of or through certain letters, the marks of punctuation, the habits and workmanship of the printer, the arrangement of the quires, the paper and its water-marks, &c.

The "system" divides the Gothic or Church types with which B[36] and B[42] and the other books mentioned above are printed into "chief" and "by-forms," (*Haupt- und Nebenformen*). The tops and bottoms of the former are ornamented with minute protruding tags, angles and points, while the "by-forms" miss most of these ornaments, their limbs being straight on the left or right, so as to be easily joined to the protruding tags, angles and points of the "chief forms," whenever the two come together. For instance, if a *u* or a *t* follows an *e*, the "by-form" of *u* with straight limbs was to be used, while the *t* was to be without its crossbar protruding on the left.

The bibliographers who deal with the incunabula enumerated above, in accordance with this "system," regard the books in which they find these chief and by-forms used in their proper places as the earliest, and therefore as the products of Gutenberg's "creative genius and skill," while they ascribe the books which bear evidence of the misuse of those forms to other printers, but their types to him. But this is an uncertain guide, as by errors in the distribution of the types after the printing of the first or second pages this misuse may already occur in the third and further pages of a book. In this way, however, the "system" arranges the books enumerated above in the following approximately chronological order:—

1443–1444. "*First* phase" of the Gutenberg type (=the *Donatus* type). The numbers ii., iii., iv. (with the suspicious date 1451) and v.

1447 (end of) till 1457(?). "*Second* phase" of the same type (=the *Kalendar* type). The numbers vi. to xiv.

1450–1453. B[42] presumed to have been finished in or before 1453, taking this year, written in the Klemm copy, as genuine.

1453. "*Third* phase" of Gutenberg's type, B[36] (xviii., of which the earliest known date is 1461).

1454. The two Indulgences with their types (1, 3; 2, 4).

1457. The two Psalter types.

1461, 1462 till (?). Pfister, who is said to have acquired the type of B[36] from Gutenberg, is known to have issued a book with the date 14 February 1461, and another with the year 1462. Hence, Schwenke says that the 36-line Bible type, which he regards as a "continuation" of the *Donatus*, and the *Kalendar* types, had a life of nearly 20 years (*Veröffentl.* ii. 1). Type v. is thought to be Gutenberg's earliest (before 1443!) by the few who regard the "Missale speciale" and the "Missale abbreviatum" as his work.

The "*Donatus* type" is so called from the Paris *Donatus*, on one of whose leaves the year 1451 is written. Zedler, somewhat unreasonably, considers this date to be a forgery of Professor Bodmann, though he is known to have forged other Gutenberg documents. This type is regarded as the same as that of the *Astronomical Kalendar*, but in an earlier, more imperfect stage. As this *Kalendar* calculates the ephemerides of the sun, moon and stars, either for the year 1429 or for 1448 or 1467, it is presumed to have been printed for 1448, that is at the end of 1447, and as its type looks new and almost perfect, the Paris *Donatus* is placed considerably earlier because its type looks old. The poem on the "Weltgericht" (No. ii.) is said to show all the forms of the *Donatus* type, but as its workmanship looks primitive, it is dated back to 1443–1444. The Heiligenstadt *Donatus* (No. iii.) is placed after the "Weltgericht" (ii.), but before the Paris *Donatus* (iv.) and the other Heiligenstadt *Donatus* (v.).

Some German bibliographers do not feel sure that Gutenberg manufactured types v., vi. and vii., though they have no doubt as to the remaining. Others are of opinion that Pfister printed some of the books in the type of B[36]; Schwenke thinks this Bible could not have been begun before 1457, but all agree that every book in the above lists must have been printed either by Gutenberg himself, or in his office, or with his type, or under his superintendence.

Though the church type 1 cannot be said to be identical with that of B[36], and no further trace of the brief type 2 has been found, we see no reason for separating Indulgence[31] from Mainz printing. And assuming that it was printed there, its printer may have been Johan Gutenberg, who was at Mainz in 1454.

A peculiarity of the above-mentioned "system" is that it ascribes two types, so different in size, shape and form, as those of B[36] and B[42], to one and the same printer, merely because they "resemble" each other. This shows that the "system" takes no account of the fact that the inventor of printing, and all the early printers who came after him, in manufacturing their types necessarily imitated the forms of the written characters of their time. Hence if two printers simultaneously erected their presses in one town, their types, though cut and cast independently, were apt to resemble each other, as appears from various examples. The printers of B[36] and B[42] are no exception to this rule; they each took a MS. as their model, and the types which they produced are simply imitations of the Gothic or Church hand, which, from its first beginnings in the 10th century, if not earlier, can clearly be traced down to, and reached its greatest development in, the 15th century.[1]

The written characters of all ages and countries resemble and yet differ from each other in various respects; and as their resemblances and differences are closely reproduced by the metal printing types of every country, we are able to ascribe MSS. as well as incunabula to definite countries, some manuscripts even to "schools," a few even to definite scribes. But when two types differ in size and form, however slightly, and there is no evidence that they belonged to one and the same printer, some of their characteristics may justify us in ascribing both to the same country or town, but not to the same printer. It is, moreover, not safe to ascribe incunabula to one and the same printer on account of their similarity of the quires and divisions into volumes, their paper or water-marks (which Dziatzko observed in the two Bibles), as these particulars are nothing but a continuance of the MSS.

[1] The Cambridge University Library possesses two folio volumes (press-mark Dd. 7. 1, 2), the writing of which, ascribed in the catalogue to 1490, resembles the types of B[42] with all its chief and by-forms so much, that at first sight they might be mistaken for copies of this Bible.

Nor is his evidence for saying that B^{36} is a reprint of B^{42} conclusive. The types of B^{36} and B^{42} may be ascribed to Germany, but as both are used for the printing of a Bible and editions of *Donatus*, it is improbable that the printer of B^{42} and one set of *Donatuses* should manufacture, about the same time, another type for another Bible and another set of *Donatuses*. We have shown above that B^{42} must, on bibliographical grounds, be ascribed to Peter Schoeffer at Mainz, and as he used its type for a book which actually bears his name, all the other books in the same type must be ascribed to him. It follows that B^{36} and every other book in column A must be assigned to some other printer or printers.

Type v. is a Church type and resembles those of B^{36} and B^{42}, but it can have nothing to do with Gutenberg or the invention of printing, as it is not earlier than 1480–1490. Types vi. and vii., which are nothing but imitations of the written Psalters of the time, are employed for a work, the colophon of which distinctly mentions Fust and Schoeffer as the printers; hence they cannot be claimed for Gutenberg. Of the *Catholicon* type we speak below. Therefore the books numbered i. to xxi. in column A of the above list are the only ones about which there can be any doubt or discussion.

Here we encounter another peculiarity of the above-mentioned "system," which treats the three different types detected in these twenty-one works not as different, but as "phases" or "developments" of one and the same type, while the differences between them, and the absence or presence of certain forms of letters, are taken as guides for approximately dating the books, and for subdividing the type, hitherto known as the 36-line Bible or Gutenberg type, into three or more varieties. For instance, Schwenke (*Centralbl.*, 1908, p. 74) explains that "the types *b*, *c*, *i*, *s*, *t* enable us to distinguish the earliest from the later elements in the *Donatus* type; the 'Weltgericht' shows, at least of *i* and *s*, the old forms still unmixed. But in the Paris *Donatus*, the new forms appear by the side of the old forms, though the latter are already to a great extent superseded. The new (Heiligenstadt) *Donatus* comes between these two works; it has chiefly the old *b*, which begins to a great extent to be absent in the Paris *Donatus*."

As we cannot regard types which differ in form as "developments" of one type, we must deal with three types in column A, that is (1) the so-called *Donatus* type; (2) the *Kalendar* type; (3) the 36-line Bible type, besides the two employed for the Indulgence[31]. Gutenberg's career, and the straightened circumstances in which he appears to have lived, so far as they are known to us, make it difficult to ascribe them all to him.

More than thirty documents have come to light which enable us to trace Johan Gutenberg from 1420 to 1468. Dr Carl Schorbach has published nearly all their texts, with elaborate explanations, in the *Festschrift zum 500 jähr. Geburtstage von J. Gutenberg* (suppl. to *Centralbl. f. Biblioth.*, 1900, p. 163 sqq.), and they are further explained by Hessels (*Gutenberg, was he the Inventor of Printing?* 1886; idem, *The so-called Gutenberg Documents*, 1911).

At least six of them are known to be forgeries, among them the "relics" of a printing-press with the date "1441" which were accidentally(!) discovered in 1856 in the "Hof zum Jungen" which had always been supposed to have been Gutenberg's first printing-office at Mainz, but which we now know not to have been the case. Assuming that the Gutenberg mentioned in the remaining documents is no other than Henne (= Hans or Johan) Gensfleisch—called Gutenberg from his mother (whose maiden name was Elsa Wyrich) having lived in the "Hof zum Gutenberg" at Mainz, where he is supposed to have been born about 1400—he appears to have lived at Strassburg from 1436 (?) till the 12th of March 1444, in easy and somewhat luxurious circumstances, at least during the first three years, as he was then paying duties for large quantities of wine (about 1924 liter). But this prosperity does not seem to have continued, for on the 17th of November 1442 he borrowed 80 pounds Strassburg denarii (=about 4800 marks) from the Strassburg St Thomas Chapter, a Strassburg citizen, Martin Brechter, being his surety. From the 12th of March 1444 till the 17th of October 1448 there is no trace of him, but on the latter day he again borrowed, this time at Mainz, 150 gold guilders. Both these loans he never redeemed, nor is it known whether he ever paid any interest on his Mainz loan. But the account books of the Thomas Chapter, still preserved in the Strassburg Public Archives, show that the interest of 4 pounds per annum on his loan of 1442 was regularly paid, by him or his surety, till 1457. The interest due in the latter year was also paid, but difficulties appear to have occurred before the Chapter received it, as there is an item in their account book for 1457–1458 of two shillings for expenses, incurred by them for arresting Gutenberg and his surety. In and after 1458 no further payments were made; the Chapter had recourse to law, and made various efforts to arrest the defaulters, but in vain; and in 1474, six years after Gutenberg's death, the debt is no longer recorded in the Chapter's accounts. He can be traced at Mainz from 1450 (when he borrowed money from Fust) till the 21st of June 1457, when he is a witness at the conveyance of property in Bodenheim near Mainz. After this date we hear no more of him until the 17th of January 1465, when the archbishop of Mainz appointed him as his servant and courtier for life on account of the "grateful and willing service which he had rendered to himself and to his Stift, and will and may render in future." The nature of this "service" is not stated. It has always been supposed that he was then residing at Eltville, the residence of the archbishop, and that he died there about or before the 26th of February 1468, on which day Dr Kunr. Humery received from the archbishop some "printing apparatus which belonged to him, and which he had lent to Gutenberg." But recent researches seem to have shown that Gutenberg remained at Mainz till his death, and was buried there.

Apart from the six forgeries, about which there is no dispute, Bockenheimer, a Mainz magistrate, explains (*Gutenberg-Feier*, Mainz, 1900) as forgeries also (1) the document of the 14th of March 1434, which represents Gutenberg as having at Strassburg arrested and released the secretary of Mainz for a debt which this city owed him; (2) a document of 1437 recording a breach of promise case between Gutenberg and a Strassburg lady; (3) the records of a Strassburg lawsuit between Gutenberg and some Strassburg citizens in 1439; (4) the Helmasperger notarial instrument of the 6th of November 1455, recording a lawsuit of Joh. Fust against Joh. Gutenberg.

The last two, and a third dated the 26th of February 1468, mentioned above, are the only documents that can be said to connect Gutenberg with the art of printing. Various external and internal circumstances throw serious doubts on the genuineness of the 1439 documents; but suppose they were genuine, they only show that Gutenberg had been engaged, with other Strassburg citizens, in "polishing stones" and "manufacturing looking-glasses," and promised to give instruction in "new arts." A "press," however, is mentioned, and a clause reports that one of Gutenberg's witnesses, Hans Dünne, a goldsmith, had testified that he had earned nearly 100 guilders from Gutenberg, "merely for that which belonged to printing" (*alleine das zu dem trucken gehöret*). The document contains nothing to connect Gutenberg with the art of printing, except this line, which has clearly been added (as an afterthought) by a different hand from the one that wrote the two first lines of this witness's testimony, a circumstance which makes the whole document more than suspicious. Several theories, however, as to Gutenberg printing at Strassburg in or before 1439 have been built upon this document, and German bibliographers are even now expressing their hope of finding some day evidence of Gutenberg having printed *Donatuses* and other works in that town.

As to the notarial instrument of 1455, Bockenheimer suggests that as it contains absurdities which are contradictory to all the legal usages of the time, it may be a forgery of the Faust family, perhaps of Joh. Fr. Faust von Aschaffenburg (who pretended to descend from Joh. Fust, whom he called "Faust"), who appears to have possessed, in or about 1600, an "original" of the instrument. From this "original" are derived all the texts published before 1741. In that year, however, J. D. Köhler (*Ehren-Rettung Joh. Guttenberg's*, Leipzig) printed the text again from an "original" which is now in the Göttingen University Library (republished by Dziatzko, *Beiträge*, Berlin, 1889), and is perhaps identical with Faust von Aschaffenburg's "original." Though an analysis of the text brings out various incongruities as to the business relations between Fust and Gutenberg, it is difficult to look upon the Göttingen document as a forgery, and we deal with it here as genuine.

It is dated the 6th of November 1455, and records some of the proceedings in the lawsuit between Johan Fust (*q.v.*) and Gutenberg, which had taken place on that day in the convent of the Barefooted Friars at Mainz, whereby the former sought to recover from Gutenberg 2026 guilders in repayment of 1600 guilders which he had advanced to him (800 about August 1450, and another 800 about December 1452), with the interest thereon. The document first relates that, on some previous day (not stated), Fust had testified (1) that by a written agreement between them, Gutenberg was to "finish the work" (line 24) with the 800 guilders to be advanced to him at 6%; Fust being unconcerned whether it cost more or less. (2) Gutenberg had not been content with these 800 guilders, and Fust, wishing to please him, advanced him another 800 guilders at 6%. (3) He had himself borrowed this money, and as Gutenberg had never paid any interest, the principal sum and the interest thereon amounted to 2026 guilders (=between 15,000 and 16,000 marks), which he now demanded from him.

(4) On the same occasion Gutenberg had replied that Fust should have furnished him with 800 guilders, wherewith to make his "tools" (or apparatus; Germ. *Geczuge*), and he should be content with this money, and might devote it to his own use. (5) Such tools should be a pledge to Fust. (6) The latter should also give him (lines 37 to 40) annually 300 guilders for maintenance and furnish workmen's wages, house-rent, parchment, paper, ink, &c. (7) If they did not agree further, he should return Fust his 800 guilders, and his tools should be free; but it was to be well understood that he should finish "such work" (line 41) with the money which Fust had lent him on his pledge, and he hoped that he had not been bound to Fust to spend such 800 guilders on "the work of the books" (line 41). (8) Fust had told him that he did not desire to take interest from him; nor had these 800 guilders all, and at once, come to him in accordance with the agreement. (9) Of the additional 800 guilders he wished to render Fust an account; hence he allowed Fust no interest, nor usury, and hopes not to be legally indebted to him.

We assume, though it is nowhere stated, that these clauses relate to the "printing of books," to be executed by Gutenberg with the money which Fust advanced to him. But as he was already in debt at Strassburg since the 17th of November 1442 (and had to pay annually interest on this debt), and at Mainz since the 17th of October 1448 (also against interest), it is not surprising that when he contracted this fresh loan in 1450, at the high rate of 6%, he (by not giving any security except tools which he had still to make) practically admitted that he was penniless, and stipulated that Fust should give him also an annual sum for maintenance, and besides furnish workmen's wages, house-rent, parchment, paper, ink, &c., in fact everything required for setting up a printing-office and keeping it going. Fust seems not to have complied with these demands, otherwise he would have mentioned them in his account and at the trial. But he advanced another 800 guilders in December 1452, barely two years after his first advance, merely to please Gutenberg, who had not been satisfied with the first 800.

It is argued that Gutenberg must have been able to show Fust some specimens of his work to induce him to lend him so much money, and we have seen above that German bibliographers attribute to him a poem on the "Weltgericht," which they date *c.* 1443–1444, and the Paris *Donatus* which they date a little later, both printed, it is said, in the "first phase" of the "Gutenberg type," but showing already some traces of wear and tear; and thirdly, an *Astronomical Kalendar* (a broadside of 4 leaves) which they ascribe to the end of 1447, and regard as a "masterpiece" printed in a new type, said to be a "development" or "second phase" of the Gutenberg type, which must have been used for several years afterwards, till a fresh or "third phase" was cast of it (for B^{36}) with the alteration of some of the letters. But if Gutenberg had printed these three works in the years ascribed to them, however small they may be, he must be supposed to have had, from 1443 to 1448, types for printing them, and patrices and matrices for making his types, besides a press and various other tools for printing. Yet the notarial instrument of 1455, if it is genuine, reveals him as borrowing money, not so early as 1443, but so late as 1450, for "preparing his tools," and as having, at the time, nothing to offer his creditor as security except the tools which he still had to make(!). But, says one theory, Gutenberg, intending to print a Bible, and finding the type in his possession too large for it, manufactured a smaller one with the aid of Fust's money, while another theory would have it that he wanted to begin with the printing of a Missal, and for this purpose casted two types, one large and the other smaller. Difficulties, however, arose which induced him to use the smaller type for B^{42}, which was finished about the beginning of 1453, and Dziatzko places the type of B^{36} also in the year 1453, while Schwenke assigns a life of nearly twenty years (1443–1462) to this type.

If, however, Gutenberg had cast all these types, and printed all these books, and sold them, straight from 1443 to 1450, and from 1450 straight on to, say, 1455, he could not have done this without Fust, his money-lender, becoming aware of it, especially as Fust, for his first advance of 800 guilders, was to have received, as security, the "tools" which Gutenberg had to make before he could begin to print. Yet in 1455, fully five years after Fust had entered into such close financial relations with Gutenberg, he claimed, in spite of what he must have known of Gutenberg's supposed activity, the whole of the money which he had advanced, with interest and compound interest on it. And Gutenberg, instead of pleading on the first day of the trial that he had from 1450 to 1455 printed two large folio Bibles and a considerable number of other books, merely refers to the initial stages of his work, to "tools" to be prepared by him as a future pledge for Fust; he tells the judges that he had expected Fust to supply him with various necessaries for printing and his own existence, without saying whether Fust had complied with his demands or not, and finally declares that he had not felt called upon to devote the first 800 guilders to the "work of the books"; that he was ready to account for the second 800, but did not feel indebted to Fust either for interest or anything else, while, on the second day of the trial, he absented himself, and merely sent two of his workmen to hear what was going on (!). This does not look as if he had performed much from 1450 to 1455, but rather the reverse. Anyhow, if the Helmasperger instrument of November 1455 is not a fabrication, it shows that Gutenberg could not have begun to print before 1450; that in this year, 1450 (about August), when he borrowed money from Fust, he had no property such as a printing-office, presses, types, patrices, matrices, &c., which he must have possessed if he had been printing since 1443, to offer his creditor as security; had not a penny to maintain himself; besides being already in debt at Strassburg since 1442, and at Mainz since 1448.

The remainder of the instrument records *the verdict* given on the first day of the trial which decided (1) when Gutenberg shall have rendered his *account* of all receipts and disbursements paid out by him on the "work for the use [or profit] of them both" (1. 49), whatever less[1] money he then has received and taken in above it, that shall be reckoned in the 800 guilders; (2) but if the account should show that Gutenberg had paid out more for Fust than 800 guilders which had not come in their common good [or use] (line 60) Gutenberg shall return it to Fust; (3) and if Fust adduces by oath or by reasonable evidence that he has borrowed the above money on interest, and not lent it of his own money, then Gutenberg shall also pay such interest according to the tenor of the schedule.

The verdict is followed by Fust's *sworn declaration* regarding the amount of his claim, which he had been ordered to make in Gutenberg's presence, but which he now made in his absence, declaring (4) that he had taken up 1550 guilders which Gutenberg had received and which also had gone on "our common work" (line 60); (5) that he had annually given interest and loss, part of which he still owed; six guilders for every 100 guilders which he had thus taken up; (6) of all that Gutenberg had received of this borrowed money, which has not gone on the "work" of them both, which is found in the account, he claimed from him the interest in accordance with the verdict.

Gutenberg appears not to have produced the account which he was expected (clause 1) to render, as Fust's allusion to an account (in clause 6) must refer to his own account. Hence we know not whether he made any "disbursements." The "receipts" seem to mean nothing more than the instalments of the first 800 guilders which he acknowledged to have received from Fust, though some authors think that allusion is made to things (printed books or broadsides?) from which he might have received money by sale or otherwise.

It is to be noticed that Fust speaks here (for the sake of accuracy?) of having taken up 1550 not 1600 guilders, as in his first account. On the whole the wording of the verdict and the sworn declaration is obscure, and open to different interpretations, but it is impossible to ascribe to Gutenberg, on the strength of this document, the manufacture of the types and the printing of all the books in column A above, especially when we have regard to his own inexplicable silence at the trial, when it was incumbent on him for his own sake to show what he had done with Fust's money, and still more when we have regard to the pecuniary difficulties in which he had been placed at least eight years before he contracted these heavy new loans with Fust. Within the space of two years after the trial he was bankrupt, unable to pay either his loans or the small interest thereon, and might have ended his days in prison if the Strassburg St Thomas Stift had been able to have him arrested.

Certain circumstances point to Albrecht Pfister of Bamberg as the printer of the numbers vii., viii., ix., xviii. and perhaps those that come between them in column A. Even in former years when the church type of the Indulgence[31] (1454) was believed to be identical with that of B^{36}, it was the general opinion that, though Pfister could not have printed the Indulgence, he had acquired its church type from Gutenberg for printing B^{36}. Now that a closer examination has shown that the type of B^{36} need not be dated so early as 1454, the known dates of Pfister (1461, 1462) harmonize with the approximate date (1460) of B^{36}. It is admitted that the types of vii., viii. and ix. differ from that

[1] The instrument says: "was er dan *men* gelts dar uber enpfangen . . . hait." Senckenberg, Köhler, Van der Linde, &c., printed *nun* for the correct reading *men*. This latter word has hitherto been interpreted as meaning *more* (see Dziatzko, *Gutenbergfrage*, p. 34, note 1; Schorbach, in *Festschr.* of 1900, p. 259). Zedler (*Gutenbergforschungen*, p. 65, note) thinks that it is a dialectic by-form of the Mid. H. German *mein* found in *mein-kouf, mein-rât, mein-swern, mein-tât*, and still preserved in the Mod. H. German *Meineid*; he translates it therefore as "*widerrechtlich*" (unlawfully). But *men* is the same as the Mid. Dutch *min* (see Verdam's *Middel-Nederl, Woordenb, in voce*) = New Netherl. *minder*, and means *less*, the only meaning which can give sense to this clause.

of B^{36} in the form of certain capitals. But Pfister issued on the 14th of February 1401 at Bamberg, with the B^{36} type, an edition of Boner's *Edelstein* (88 leaves fol., with wood-engravings), and at least eight other works (Hessels, *Gutenberg*, p. 161, seq.), one of which bears the date 1462, the seven others none.

Most of the copies of the 36-line Bible now known to us were at one time or another preserved in the libraries of Bavaria, and several fragments have been found in monasteries of that country, even in a register of the year 1460 of the abbey of St Michael at Bamberg. Moreover, a transfer or sale of type from Gutenberg to Pfister is contrary to all analogy in the infancy of printing, when every printer started with a type of his own making.

The Catholicon Type.

It is alleged that, in consequence of the lawsuit between Gutenberg and Fust, the former was deprived of all tools, &c., which he had made, or is supposed to have made, with the latter's money, and that afterwards a certain Dr Homery or Humery, a syndic of Mainz, lent him fresh money to enable him to set up another printing-office.

This allegation is made on the strength of a letter of obligation (dated Feb. 26, 1468) referred to above, and given by Dr Homery to Adolph, the archbishop of Mainz, by which he acknowledges to have received from the said archbishop "several forms, letters, instruments, implements and other things belonging to the work of printing, which Johan Gutenberg had left after his death, and which had belonged and still did belong to him (Dr Homery)." It is to be observed that Homery, though willing to assist or oblige Gutenberg, had been cautious enough to reserve to himself all rights to this printing apparatus, in somewhat the same way as Fust in 1450 demanded, or was promised, to receive Gutenberg's "tools" as pledge for his advances. The Homery apparatus could hardly have been of large dimensions, seeing that it was readily passed on first from him to Gutenberg, then from the latter to the archbishop and returned again to its owner. But it is presumed that with these types, which appear in the above list as type VIII., Gutenberg had printed (1) Joannis de Balbis, *Catholicon* of 1460, copies of which exist in the Cambridge University Library, three in the British Museum, two in the Paris Library, in the Spencer collection of the Rylands Library, in the Wolfenbüttel and Mainz libraries, &c.; (2) Matthaeus de Cracovia, *Tractatus rationis*, 22 leaves, of 30 lines, 4to, three copies of which are in the British Museum, one in the Rylands, one in the Cambridge, two in the Paris Library, &c.; (3 and 4), two editions of Thomas Aquinas, *Summa de articulis fidei*, in 4to., the first of 13 leaves and 34 lines (two copies of which are in the British Museum, one in the Rylands and one in the Cambridge Library, &c.); the second of 12 leaves and 36 lines (copies in the British Museum and the Paris Library); and (5) an indulgence of 1461 of 15 lines.

We have seen above that on the 17th of January 1465 Adolph II., archbishop of Mainz, had appointed "Johan Gudenberg, his servant and courtier." It has always been inferred from this that Gutenberg had quitted Mainz and gone to Eltville (Elfeld) to reside at the archbishop's court, and that, his dignity as courtier preventing him from printing himself, he passed the *Catholicon* types on to Henry Bechtermuncze at Eltville. It seems certain that in 1467 the *Catholicon* type with some additions (already found in the Indulgence of 1461) was at Eltville near Mainz, in the hands of Henry and Nicholas Bechtermuncze and Wigandus Spyes de Orthenberg, who issued on the 4th of November of that year (vi.) *Vocabularius ex quo* (a Latin-German vocabulary) in 4to, 166 leaves, 35 lines, the only known copy of which is in the Paris Library, and (vii.) *Vocabularius ex quo*, 2nd edition, with colophon dated the 5th of June 1469, 4to, 165 leaves, 35 lines, copies of which exist in the Rylands, the Blenheim, and the Paris libraries. It is therefore asked how the Bechtermunczes could have been using the *Catholicon* type in 1467, if we assume that it was this type to which Homery refers in his letter of obligation as being in his possession. Some, therefore, conclude that the *Catholicon* and the four other works in the same type were printed at Mainz by Henry Bechtermuncze, who may afterwards have transferred his printing office to Eltville. In that case it is difficult to see what type Homery could refer to, unless it were type II, a close imitation of which, if not the actual type, was used by Nicholas Bechtermuncze at Eltville in printing (March 12, 1472) a 3rd edition of the *Vocabularius ex quo*, 166 leaves, 35 lines, copies of which are preserved in the Paris and Hamburg libraries, and an edition of Thomas Aquinas, *Summa de articulis fidei*, 12 leaves, 35 lines (Munich Library).

It would seem, however, that Fust and Schoeffer were the printers and publishers of the *Catholicon*, and the other three works mentioned above, as the latter advertised them for sale in a list which he printed and circulated in 1469–1470 (see Konr. Burger, *Buchhändleranzeigen des 15 Jahrhunderts*, Leipzig, 1907, No. 3). Schoeffer may of course have purchased the stock of these books from Gutenberg or acquired it after his death from Homery, but as nothing compels us to attribute the printing of these books to Gutenberg, there is still less reason to deny that Fust and Schoeffer printed them, as the much discussed colophon of the *Catholicon* is found, almost verbatim, in three books published by them in 1465 and 1467. Hence the numbers i. to vi. are the only ones that could be ascribed to Gutenberg.

Even this number, involving the manufacture of four different types (apart from the alterations in the forms of certain letters which involved the making of new patrices and matrices) would be large for a man who, after having lived in luxury for some years, practically subsisted from 1442 to 1455 on money which he borrowed from various parties and never repaid. But the poem on the "Weltgericht," printed on paper, could scarcely be placed at the head of a list which includes and, but for this poem, begins with vellum printed works. Moreover, as it can hardly be regarded as a specimen of primitive printing, it takes a more natural place by the side of the paper-printed *Turkkalendar*, *Cisianus* and *Conjunctiones*, which all show that printing on paper was beginning to supersede that on vellum. It is asserted that its type is the same as that of the 1451 *Donatus*, but this is doubtful.

That the *Astronomical Kalendar* calculates the ephemerides for 1448 is no evidence of its having been printed at the end of 1447, as kalendars of this kind seem to have been printed without any regard to time and circumstances. Some years ago the *Cisianus* was ascribed to Gutenberg and to the year 1444, because some of the saints and movable feasts mentioned in it were thought to relate to that year. But as the same saints and feasts occur in the same way in *Cisianus* editions printed long after 1500, this notion was abandoned. The *Astronomical Kalendar* in question lays down rules for blood-letting at certain times of the year, and was evidently intended to be hung up in houses as guides for this purpose. It is admitted that it contains mistakes if we apply its calculations to 1448, and it has not yet been proved that these rules required a special kalendar for each year in particular. Removing, therefore, Nos. ii. and vi. to somewhat later dates in the list, the *Donatus* No. iii. and that of 1451 (No. iv.) with another edition (No. v.) of the same school-book remain at the head of the column A, together with the Indulgence ^{31}, as the only works that could be ascribed to Gutenberg. They bring us down to the time (*c.* 1451) when he, according to the Helmasperger document, may be supposed to have been in a position to exercise the new art of printing.

It is necessary to point out that eight books—(1) *Prognostication* or *Calendar*; (2) Hermann de Saldis, *Speculum sacerdotum*; (3) *Tractatus de celebratione missarum*; (4) a work in German treating of the necessity of councils; (5) *Dialogus inter Hugonem Cathonem et Oliverium super libertate ecclesiastica*; (6) Sifridus de Arena, *Determinatio duarum quaestionum*; (7) idem, *Responsio ad quatuor quaestiones*; (8) *Klagspiegel*, or *New geteutscht Rechtbuch*—have been ascribed to Gutenberg on the strength (*a*) of the date 1460, which was said to be found in a *Prognostication* in the Darmstadt library, and (*b*) of a so-called rubrication alleged to be in a copy of the *Tractatus de celebratione missarum*, in which "Johannes dictus a bono monte" and Johannes Numeister are represented as offering this work on the 19th of June 1463 to the Carthusians at Mainz. But the date in the *Prognostication* has been falsified from 1482 into 1460, and the rubrication in the *Tractatus* is a forgery (Hessels, *Gutenberg*, pp. 107–114). The eight books are now considered to have been printed by Erhard Reuwich.

Apart from these disputed points there is no further difficulty as regards the history of Mainz printing. Fust and Schoeffer worked together from 1457 to 1466, starting in August 1457 with an edition of the *Psalterium*, printed in large missal types, which, as far as we know, is the first printed book which bears a date, besides the place where it was printed and the name of the printers. It was reprinted with the same types in 1459 (the second printed book with date, place and name of printer), in 1490, and in 1502 (the last work of Schoeffer, who had manufactured its types). In 1459 Fust and Schoeffer also published Gul. Durantus, *Rationale divinorum officiorum*, with the small type (usually called *Durandus* type) with which they continued to print long afterwards. In 1460 they published the *Constitutiones* of Pope Clement V., the text printed in a type (Clement type) about a third larger than the *Durandus*. This type was, however, in existence in 1459, as the colophon of the *Durandus* is printed with it.[1]

The Invention Controversy.—Now that we have traced the art of printing from the moment (1454) that it made its

[1] See further Bernard, *Origine*, i. 216 seq.

appearance in a perfect state at Mainz, and have seen that none of the particulars known to us of the life and career of Johan Gutenberg, who is alleged to have invented it, nor any of the books said to have been printed by him, afford us any basis for ascribing that honour to him, we will examine what has been said during a period of more than four hundred years on the question of the invention. For this purpose we will gather up into a chronological sequence (*a*) a few of the most important expressions used by the earliest printers in their colophons, (*b*) whatever documentary evidence there may be on the subject, and (*c*) some accounts of the earliest authors on the question. The Roman numerals i., ii., &c., are for the sake of convenient reference.

Early Testimonies.

The earliest [1] testimony (i.) is the notarial instrument, dated the 6th of November 1455, of the lawsuit between Fust and Gutenberg, already mentioned above, which records transactions between the two men from August 1450 to November 1455, Fust speaking of "the work" and of "our common work"; Gutenberg of "tools" which he wanted to prepare, of "workmen's wages, house-rent, vellum, paper, ink, &c.," of "such work" and of "the work of the books," whereas the judges speak of "the work to the profit of both" and "their common use."

From Book Colophons, &c.

(ii.) In the first [2] book published with a date (the Mainz Psalter, issued the 14th of August 1457 by Fust and Peter Schoeffer), it is said that it was perfected at Mainz by an "adinventio artificiosa imprimendi ac caracterizandi absque calami ulla exaratione," repeated and varied later, by the same printers in their colophons of the years 1459 to at least 1470. (iii.) In 1460 the colophon of the *Catholicon* published at Mainz without the printer's name, after stating that "the book was printed at Mainz, the genial city of the renowned German nation, which town God's mercy had deigned to prefer and adorn above the other nations of the earth by such an exalted light of genius and spontaneous gift," adds that the book was printed and completed "non calami, stili, aut pennae suffragio, sed mira patronarum formarumque concordia, proporcione, et modulo." This work (which is to be ascribed to Peter Schoeffer) is considered to have been printed by Gutenberg, and the mention of God's mercy, &c., is regarded as an allusion to the invention of printing. The phrase is, however, also found, with some variations, in the *Liber sextus Decretalium*, in the *Summa* of Thomas Aquinas, and in the *Clementinae*, published respectively on the 17th of December 1465, the 6th of March and the 8th of October 1467, by Fust and Schoeffer. (iv.) On the 17th of January 1465 Adolph II., archbishop of Mainz, by a public decree, appointed Gutenberg as his servant in reward for "his services," but he does not say what kind of "services" he had rendered, nor does he speak of him as the inventor of printing, nor as a printer. (v.) In the *Grammatica rhythmica*, published in 1466 by Fust and Schoeffer, the third line of the colophon runs: "Hinc Nazareni sonet oda per ora Johannis," which was formerly regarded as an allusion to Johann Fust or Johann Gutenberg, but which more probably refers to Johann Brunnen or Fons, the author of the grammar. (vi.) On the 26th of February 1468 Dr Homery wrote to the archbishop of Mainz the letter quoted above, from which it may be inferred that Gutenberg had been a printer, though nothing is said as to his being the inventor of printing. (vii.) In 1468 Schoeffer reprinted Fons's *Grammatica*, in the colophon of which it is said: "At Moguntina sum fusus in urbe libellus meque (the book) domus genuit unde caragma venit." (viii.) Schoeffer published on the 24th of May 1468 the 1st edition of *Justiniani Imper. Institutionum juris libri VI., cum glossa.* To this were added by way of colophon some verses commencing: "Scema tabernaculi," &c., in which it is said that (the ornament of the church) Jesus "hos dedit eximios sculpendi in arte magistros . . . Quos genuit ambos urbs Moguntina Johannes, librorum insignes prothocaragmaticos," which is regarded as an allusion to Johann Gutenberg and Johann Fust as first or chief printers. (ix.) In the same year (1468) Johannes Andreae, bishop of Aleria, says, in the dedication of his edition of St Jerome's *Epistles*, published in that year (Dec. 13,) at Rome, to Pope Paul II., that "Germany is to be honoured for ever as having been the inventress of the greatest utilities. Cardinal Cusa wished that the sacred art of printing, which then (under Cardinal Cusa, who died on the 11th of August 1464) seemed to have arisen in Germany, were brought to Rome." (x.) In 1470 Guil. Fichet, in an octastichon inserted in the Paris edition of 1470 of the *Letters* of Gasparinus of Bergamo, exhorts Paris to take up the almost divine art of writing (printing) which Germany is acquainted with (see below No. xiii.). In the same year Erhard Windsberg writes to the same effect in an epigram inserted in the *Epistolae Phalaridis* published at Paris about 1470. (xi.) In 1471 Ludov. Carbo, in the dedication of the *Letters* of Pliny to Borso, duke of Modena, speaks of the Germans having invented printing; Nicolaus Gupalatinus (Venice, 1471) of a German being the inventor of printing, and Nicolaus Perottus of the art which had lately come from Germany. (xii.) On the 21st of May 1471 Nicolas Jenson published an edition of Quintilian, edited and revised by Ognibene de Lonigo (Omnibonus Leonicenus), who in the preface speaks of its printer as "librariae artis mirabilis inventor, non ut scribantur calamo libri, sed veluti gemma imprimantur, ac prope sigillo, primus omnium ingeniose demonstravit." (xiii.) About 1472 the first three printers of Paris published Gasparinus Pergamensis's *Orthographiae liber*, to which is prefixed (in the copy of the university library of Basel) a letter, dated the 1st of January, from Guillaume Fichet (see above No. x.), prior of the Sorbonne, to Robert Gaguin, in which he says that "it is rumoured that in Germany, 'not far from the city of Mainz,' a certain Johann Gutenberg (Johannes, cui cognomen Bonemontano) first of all invented the art of printing (impressoriam artem), by means of which books are made with letters of metal, not with a reed (as the ancients did), nor with the pen (as is done at present)." (xiv.) On the 14th of July 1474 Joh. Philippus de Lignamine published at Rome *Chronica summorum pontificum imperatorumque*, in which, between two entries, relating one to the 14th of July 1459 and the other to the 1st of October 1459, an undated paragraph is found saying that Jacobus with the surname of Gutenberg of Strassburg and a certain other one named Fustus, "imprimendarum litterarum in membranis cum metallicis formis periti, trecentas cartas quisque eorum per diem facere innotescunt apud Moguntiam Germanie civitatem." It says the same of Mentelin, and (under 1464) of Conrad Sweynheym, Arnold Pannarts, and Udalricus Gallus. (xv.) On the 23rd of May 1476 Peter Schoeffer issued the 3rd edition of the *Institutiones* of Justinian, with the same imprint as in the edition of 1468 (see testimony viii.), but with the addition that Mainz is the "impressoriae artis inventrix elimatrixque prima." (xvi.) In the *Fasciculus temporum*, issued at Cologne in 1478, it is stated under the year 1457 that the printers of books were multiplied on earth, deriving the origin of their art from Mainz. The earlier editions merely stated that the printers of books were multiplied on earth. (xvii.) In 1483 Matthias Palmer of Pisa, in the *Chron. Euseb.* published at Venice, stated under the year 1457 that students owe a great debt to Germany, where Johannes Gutenberg zum Jungen, knight of Mainz, invented the art of printing in 1440. (xviii.) In the same year, 1483, Jac. Phil. Foresta of Bergamo, in the *Supplementum chronicorum*, says under the year 1458 that the art of printing books was first discovered in Germany, according to some by Guthimberg of Strassburg, according to others by Faust (see xiv.), according to others by Nicolas Jenson (see xii.). (xix.) On the 6th of March 1492 Peter Schoeffer published the *Niedersächsische Chronik* of Conrad Botho, saying in the colophon that it was "geprent . . . in . . . Mentz, die eyn anefangk is der prentery."

From Documentary Evidence.

(xx.) At the end of 1494 two Heidelberg professors, Adam Wernher and Joh. Herbst, composed some Latin verses in honour of Johannes Gensfleisch (Gutenberg's family name turned into the Latin Ansicarus), whom they called "primus librorum impressor" and "impressoriae artis inventor primus." [3] (xxi.) In 1499 Jacob Wimpheling (born at Schlettstadt 1450, died 1528) published (at Mainz, by P. Friedberg [?]) an *Oratio in Memoriam Marsilii ab Inghen* (d. 1396), in which he, on leaf 22 a, praises Joannes Ansicarus in Latin verse for his invention at Mainz. (xxii.) These verses are preceded by a Latin epitaph on Johann Gensfleisch, "artis impressoriae inventor" and "repertor," written by Adam Gelthus, a relative of Gutenberg, adding that his remains rest in the Franciscan Church at Mainz. (xxiii.) In the same year (1499) Polydore Vergil (*De inventoribus rerum, Venice*, lib. ii. cap. 7) says that a certain Peter [Schoeffer ?], a German, invented in 1442 the art of printing at Mainz in Germany, as he had heard from the latter's countrymen; this statement was repeated in a Venice edition of 1503. In later editions "Peter" was altered to "Joh. Gutenberg." (xxiv.) In the same year Koelhoff, printer at Cologne, published *Cronica van der hilliger Stat van Coellen*, in which on fol. 311 b, the following statements occur: (1) The art of printing was found first of all in Germany at Mainz about the year 1440; (2) from that time till 1450 the art and what belonged to it were investigated; (3) and in 1450, when it was a golden year (jubilee), they began to print, and the first book that they printed was the Bible in Latin, in a large letter, resembling that with which at present missals are printed. (4) Although the art was found at Mainz, as aforesaid, in the manner in which it is generally employed now, yet the first prefiguration was found in Holland from out the *Donatuses* which were printed there before that time, and from and out of them was taken the beginning of the aforesaid art, and it was found much more masterly and exact (*subtilis*) than that other manner was, and has become more and more artistic. (5) Omnibonus wrote in a preface to Quintilian, and in some other books, too, that a Walloon

---

[1] The earliest would be the records of the Strassburg lawsuit of 1439, in which the word "trucken" is used, but we cannot accept them as genuine.

[2] Earlier is perhaps the *Donatus* issued by Peter Schoeffer, possibly before 1456, the colophon of which says that it was finished Arte nova imprimendi seu caracterizandi . . . absque calami exaratione (by a new art of printing or making letters . . . without the writing of a pen).

[3] These verses were not published at the time, but in the 19th century by F. J. Mone, *Quellensamml. der bad. Landesgesch.* iii. 163, from the contemporary MS. of Adam Wernher, preserved in the archives of Carlsruhe.—We pass over here a few books which merely say that the invention was made at Mainz: a *Chronyk der landen van Overmaas*, written by an inhabitant of Beek, near Maastricht, in the 15th century; the *Chronycke van Hollandt* (Leiden, 1517), &c.

from France, named Nicol. Jenson (see xii.), discovered this art; but that is untrue, for there are those still alive who testify that books were printed at Venice before Nicol. Jenson came there and began to cut and make letters. (6) But the first inventor of printing was a citizen of Mainz, named Junker Johan Gudenburch. (7) From Mainz the art was introduced first of all into Cologne, then into Strassburg, and afterwards into Venice. (8) The origin and progress of the art were told to the writer verbally by Ulrich Zell of Hanau, still printer at Cologne (*anno* 1499), through whom the said art came to Cologne. **(xxv.)** In 1501 Jacob Wimpheling (see xxi.), who stated in his *Oratio querulosa contra Invasores Sacerdotum*, &c. (published at Delft, *c.* 1495) that chalcography had been invented at Mainz, says on p. 43 of his *Germania* (Strassburg, Joh, Prüss, 1501), that the invention was made at Strassburg by Johann Gutenberg of Strassburg, and that it was perfected at Mainz. **(xxvi.)** In 1503 Johann Schoeffer (the son of Peter Schoeffer and the grandson of Johann Fust) published an edition of *Hermes Trismegistus*, in which he represents himself as one of the most distinguished citizens of Mainz (nobili vrbe maguntina artis impressoriae inventrice illuminatriceque prima), descended from the most fortunate race who invented the art of printing. **(xxvii.)** In 1504 Ivo Wittig, a canon and the keeper of the seal of the St Victor Cathedral near Mainz (of which Gutenberg had been a lay member), erected in the house "Zum Gutenberg" a memorial stone and an epitaph (missing already in 1700) to Joh. Gutenberg of Mainz, "qui primus omnium litteras aere imprimendas invenit." **(xxviii.)** In 1505, in the German translation of Livy published by Johann Schoeffer (see xxxii.) the dedication to the emperor Maximilian, probably written by Ivo Wittig (see xxvii.), speaks of Johan Güttenbergk as inventor of printing (1450) and Johan Faust and Peter Schoeffer as improvers and perpetuators of the art. This work was reprinted at least eight times (in 1514, 1523, 1529, 1530, 1533, 1551, 1553, 1557) with the same dedication; but in 1509 the *Breviarium Moguntinum* says that it was printed at the expense and labour of Johann Schoeffer, whose grandfather (*i.e.* Johann Fust) was the first inventor and author of the art of printing (see xxvi.). **(xxix.)** In 1505 Jacob Wimpheling, in his *Epithoma Germanorum* (Strassburg, 1505), asserts (on leaf xxxviii. b and xxxix. a) that in 1440 Johann Gutenberg of Strassburg invented there the art of printing. And in 1507, in his *Catal. episcoporum Argent.* (Strassburg, 1507), he says that the art was invented, though in an imperfect manner, by a certain Strassburger, who afterwards went to Mainz and joined others working and trying the same art, where it was, under the guidance of Johann Gensfleisch, perfected in the house "boni montis" (Gutenberg). This he repeated in 1515. **(xxx.)** About 1506–1511 Johannes Trithemius wrote his *Chronikon* of Spanheim, published at Frankfort in 1601, in which he says (p. 366), under the year 1450, that the art of printing books was discovered afresh (*à novo*) at Mainz by a certain citizen said to be Johan Gutenberg, who, after having spent all his property in accomplishing the new invention, perfected it by the advice and assistance of Johan Fust and others. The first propagator of the new art was, after the inventor, Peter Schoeffer. **(xxxi.)** In 1515 Johann Schoeffer published Joh. Trithemius's *Compendium sive Breviarium historiae Francorum*, and said in the colophon that the book was published at Mainz (the *first* inventress of the art of printing), by him, the grandson of the late Johann Fust, the *first* author of the said art, who finally from his own genius commenced to excogitate and to investigate the art in 1450, and in 1452 perfected it and commenced printing, assisted by many necessary inventions of Peter Schoeffer von Gernsheim, his servant and adopted son. Johann Fust and Peter Schoeffer kept this art secret, binding all their servants and domestics by oath never to reveal it; but in 1462 it was spread by the same domestics into divers countries. The same statements were repeated in the *Breviar. eccles. Mindensis* of 1516. **(xxxii.)** On the 9th of December 1518 the emperor Maximilian accorded to Johann Schoeffer the privilege of printing Livy (1518–1519), saying that "he has learnt and been advised on the faith of worthy testimonies that the ingenious invention of chalcography was effected by the printer's grandfather." Erasmus, in his preface to this book, says that great praise is due to the inventors of the almost divine art of printing, the chief among whom is rumoured or said to be Joan Faust, the grandfather of Joan Scheffer; and Nicolaus Carbachius, in a final notice of the edition, speaks of "Joan Scheffer Chalcographus," whose grandfather first invented and exercised this art in Mainz. **(xxxiii.)** In 1519 Joh. Thurmayer Aventinus (1474–1534) wrote that "in 1450 Joannes Faustus, a German, a citizen of Mainz, invented a new kind of writing, called chalcography, and completed it in two years; it was kept secret by him and Peter Schoeffer, his son-in-law, but divulged in Germany ten years afterwards by Faust's servant, Johannes Guttenberger, a Strasburger." **(xxxiv.)** In a pedigree of Lourens Janssoen Coster of Haarlem and his descendants, preserved in the Haarlem Town Library, it is asserted that "he brought the first print into the world 1446." It would seem that an attempt was made, at some time or other, to alter the date 1446 of this document into 1440, otherwise its genuineness is beyond doubt; in its present state it was probably first drawn up about 1559, but its first four divisions including the above statement were evidently copied from some earlier document, as they are all written by one hand, in Roman or Karoline minuscules, and, of course, this earlier document may be assumed to have existed long before 1502–1560, the period usually assigned to this pedigree, and to go back to the time of L. J. Coster himself. There is some doubt as to whether the year 1446 refers to Coster's bringing the first print into the world, or to the marriage of his daughter. In the latter case the "first print" must be earlier. **(xxxv.)** In 1520 Johan Schott, a printer at Strassburg and grandson of Johan Mentelin, the first printer of that town, published an edition of Ptolemy, and printed at the end the arms of his grandfather with the following inscription: "insigne Schottorum Familiae ab Friderico Rom. Imp. III. Joan. Mentelio primo Typographiae Inventori ac suis concessum: Anno Christi 1466." Apart from the assertion that Mentelin was the inventor of printing, we may remark that the emperor Frederick III. raised Mentelin to the rank of a nobleman in 1466 and granted him new arms. **(xxxvi.)** In 1524 Johan Schoeffer speaks again (at the end of S. Prosperi *libellus*) of his maternal grandfather Joan "Faust" and his father Peter Schoeffer, citizens of Mainz, who first of all invented and practised metal printing. **(xxxvii.)** in 1531 Ivo Schoeffer, the son of Johan Schoeffer, speaks of his great grandfather Johan "Faust" having invented chalcography, and "Faust" continues for many years afterwards to be spoken of as the inventor, sometimes in connexion with Peter, once or twice even with Ivo Schoeffer. **(xxxviii.)** About 1533 the Neapolitan Mariangelo Accorso, who had resided at the court of Charles V., wrote on the first leaf of a vellum *Donatus* (in the possession of Aldus Manutius, jun.) that "Joh. Faust of Mainz first discovered the art of printing with metal types which afterwards he made of lead; his son Peter Schoeffer added much afterwards to polish the said art. This *Donatus* and *Confessionalia* were printed first of all in 1450. Faust derived the suggestion from a *Donatus* printed before in Holland from an engraved block." This statement is found on p. 411 of the *Biblioth. Apost. Vaticana* of Angelo Roccha (Rome, 1591), who saw the leaf. Some consider its latter part to have been derived from the *Cologne Chronicle* (xxiv.) and it seems probable that it was a mixture of some of the above testimonies. **(xxxix.)** In 1536 Johan Schott (see xxxv.) published *Historien Handt-Buchlein* (Strassburg, 1536), in which on leaf b[1] and b[2] he says that "Hans Mentlin of Strassburg invented the art, which, through infidelity, was brought to Mainz." On the strength of this and other statements (xxv., xxix., xxxv.) the bicentenary of the Strassburg invention was celebrated there in 1640. **(xl.)** In 1541 Joh. Arnold (Bergel or) Bergellanus, who had settled as press-reader at Mainz two years previously, published his *Encomium chalcographiae* (Mainz, in the St Victor Stift, Fr. Behem, 1541, 4to), in which the lawsuit between Fust and Gutenberg (i.) is alluded to for the first time. Bergel had read Tritheim's books (xxx.), in which the invention is ascribed to Johan Gutenberg with two coadjutors, Johann Faust and Peter Schoeffer, which he (Bergel) had heard confirmed in conversations with Mainz citizens; he had also seen some old tools prepared for the work by the originators which were still in existence. Gutenberg invented it in 1450. **(xli.)** About 1561 Jan van Zuren (born at Haarlem in 1517) and Dirk Volkerts Coornhert (born at Amsterdam in 1522) established a printing-office at Haarlem. Of the former it is alleged that he had compiled a work on the invention of printing, which is presumed to have been lost during the siege of Haarlem in 1573. This work was not publicly mentioned before 1628, when Peter Scriverius published his *Laurecranz voor Laurens Coster*, in which he says that he had only found the title, preface and introduction, in which Van Zuren contended that the first foundations of the art were laid at Haarlem, and that it afterwards accompanied a foreigner to Mainz. In this introduction he does not mention the name of the inventor, nor a date, but points in indefinite terms to the house of the inventor as still existing. **(xlii.)** In the same year (1561) Van Zuren and Coornhert published an edition of the *Officia Ciceronis*, in which the latter, in a dedication to the magistracy of Haarlem, refers to the rumour that the art of printing books was invented first of all at Haarlem, and was brought to Mainz by an unfaithful servant and much improved there. He adds that very old and dignified persons had often told him, not only the family of the inventor, but also his name and surname, and had explained the first crude way of printing, and pointed out to him the house of the first printer. **(xliii.)** In 1566 Luigi Guicciardini, a Florentine nobleman, who had visited the Netherlands and had resided many years at Antwerp, finished a description of the Netherlands (published in 1567), in which, alluding to Haarlem, he speaks of the invention there according to the assertions of the inhabitants, the evidence of some authors, and other remembrances; the inventor died before the perfection of his art; his servant went to Mainz, where he perfected the art, and hence the report that it was invented there. **(xliv.)** About 1568 (it is calculated) Hadrianus Junius wrote his *Batavia*, published at Leiden in 1588, with two prefaces, dated, the one from Leiden, the 6th of January 1575, the other from Delft *ad annum salutis* 1575. On p. 253 he says: (*a*) the opinion that the forms of the letters whereby books are printed were first discovered at Mainz is very inveterate, but old and eminent inhabitants of Haarlem had assured him that they had heard from their ancestors (*b*) that there lived at Haarlem, more than 128 years before, in a decent house then existing, near the market-place, opposite the royal palace, Lourens (son of) Jan, surnamed Coster, who, while walking in the wood near Haarlem, began to shape beechen bark first into figures of letters, by which, reversely impressed one by one on paper, he composed one or two lines to serve as an example for the children of his son-in-law. (*c*) When this succeeded, he began to contemplate greater things, and first of all invented, assisted by his son-in-law Thomas (son of) Peter, a more gluey and substantial kind of ink (as the ordinary ink was found to blot), with which he printed whole tablets with pictures, with the letters added. (*d*) Junius had seen books of this kind printed by Coster (the beginnings of his labours) on the rectos of the leaves only, not on both sides; the book was written (in Dutch) by an anonymous author, and entitled *Speculum nostrae salutis*, in which care was taken that the blank versos could be pasted together, so that the blank pages should not present any unsightliness. (*e*) Afterwards (Coster) changed the beechen characters into leaden, and the latter again into tin ones. Very ancient wine-pots cast of the remains of these types were still to be seen in the house of Lourens, which was afterwards inhabited by his great-grandson Gerard (son of) Thomas, who had died an old man a few years before. (*f*) When the new merchandise attracted purchasers everywhere, workmen were added to (Lourens') household, among whom was a certain John (whether, as was suspected, Faust, or another of the same name, Junius did not inquire), who was bound to the work of printing by oath. But, when he thought he knew the art of joining the letters and of casting the types, &c., he stole away, when everybody had gone to church, the whole apparatus of the types and the tools prepared by his master, and hastened to Amsterdam, thence to Cologne, until he arrived at Mainz, where he could remain in safety, and, having opened a work-office, issued within the space of one year, about 1442, the *Doctrinale* of Alexander Gallus and the *Tracts* of Petrus Hispanus, printed with the same types which Lourens had used at Haarlem. (*g*) Junius recollects that Nicolaas Gaal, his tutor, a man of firm memory and venerable old age, had told him that as a boy he had often heard a certain bookbinder, Cornelis (a man of more than eighty years of age, who had been an under-workman in the same office) narrating the story of the invention (as he had heard it from his master), the polishing and increase of the crude art, &c., and cursing those nights which he had passed, during some months, with the culprit in one bed. (*h*) The burgomaster Quirinus Talesius admitted to Junius that he had formerly heard nearly the same from the mouth of the same bookbinder.

(**xlv.**) Natalis Comes, in his *Universa historia sui temporis* (Venice 1581; the edition of 1572 contains only books 1 to 10), lib. xxiv. 521, says that Haarlem is memorable on account of the almost divine invention of printing books first contrived by John Cutenberg in the year 1453; who, when he had invented the rudiments of it, had a rather cunning servant, observant of his master's art, who, after the death (see xliii., xlvi., xlvii.) of Johan went to Mainz and there perfected the art, and hence the report that it was invented in that city. (**xlvi.**) Geo. Braunius, in the second volume of his *Civitates orbis terrarum* (Cöln, 1575?), says of Haarlem, that in this town and the whole province of Holland, there was a fixed tradition that the art of typography was first invented there. But before it was perfected and brought to light, the inventor died (see xliii., xlv.) and his servant went to Mainz, and made it known there. (**xlvii.**) Mich. Eyzinger on p. 75 of his *Niederländsche Beschreibung* (Cöln, 1584) says that the art of printing, as it was then done, with letters and characters on paper or otherwise, was invented by some one at Haarlem, but, on the death of his master (see xliii., xlv., xlvi.), was brought to light in perfection by his servant. (Repeated by Matthias Quadus Pictor Juliacus in *Compendium Universi, sive Geographicae narrationes*, lib. iii. c. 38, Colon. 1600.) (**xlviii.**) *Chronicon Sublacense*, per P. D. *Cherubinum Mirtium Trevirensem monachum Sublacensem laboratum anno . . . 1629*. A MS. in 4to, on p. 150 of which is read: Non egre ferat, quaeso lector, si inseruero ratione temporis rem non plane ab instituto nostro alienam, nempe laudabile studium monachorum Sublacensium teutonicorum . . . Nempe, quod nobilissima librorum typographia paucis ante annis in inferiori Germania enata est et in lucem producta (with a note by Mirtius: Hollandia A.D. 1453 in civitate Haarlem per Joannem Cutenbergam, quae tamen ars, postea Moguntiae per dicti inventoris famulum in meliorem redacta fuit excudendi formam). It is supposed that xlv. to xlvii. are derived from Test. xliii., but this seems impossible as regards xlviii.

(**xlix.**) In 1628 Scriverius in his *Laurecranz* (see xli.) placed the date of the Haarlem invention as far back as 1428, and mentioned as its inventor Lourens Janszoon, sheriff of Haarlem. He asserts that the art of printing appeared, " not in the manner as it is used now, with letters cast of lead and tin, but a book was cut leaf for leaf on wooden blocks," and the Haarlem inventor was robbed in 1440 by Johan Gutenberg. Scriverius based the date 1428 upon a Hebrew *Chronicle* compiled by Joseph ben Meir (1496–1575?), and published in 1554 at Sabionetta by Cornelius Adelkind, where, under the year of the Jewish era 5188 (=1428), the author mentions a book (without giving the title) printed at Venice and seen by him. Scriverius, being convinced that this could only refer to a book printed at Haarlem, applied the entry to a xylographic *Biblia pauperum*, of which he gave a description, together with several other blockbooks and early printed books.

(**l.**) In 1639 Boxhorn pushed the date of the Haarlem invention back to 1420, referring, as his authority, to the same *Chronicle* of Rabbi Joseph. Since that time the date of the Haarlem invention has been variously placed between 1420 and 1430.

Later testimonies are mere repetitions of earlier statements.[1]

We need not discuss the story of Antonio Cambruzzi, who asserted that Pamfilo Castaldi invented printing at Feltre, in Italy, in 1456, and that Fausto Comesburgo, who lived in his house in order to learn the Italian language, learnt the art from him, and brought it to Mainz; the story, however, found so much credence that in 1868 a statue was erected at Feltre in honour of Castaldi. Nor need we speak of Kuttenberg in Bohemia, where John Gutenberg is asserted to have been born and to have found the art of printing. Nor is it necessary to speak of Jean Brito, who printed at Bruges *c.* 1477–1488, and is asserted to have invented printing there. We may also pass over Johann Fust, later on called Faust (testimonies xiv., xviii., xxvi., xxviii., xxxi., xxxii., xxxiii., xxxviii.), as we know from the Mainz lawsuit of 1455 that he had simply assisted Gutenberg with loans of money. We may also pass over Johann Mentelin of Strassburg (testimonies xxxv., xxxix.), only remarking here that he had already printed a Bible in 1460, and that he is mentioned in Strassburg registers as a chrysographer or gold-writer from 1447 to 1450; but of his whereabouts between 1450 and 1460 there is no record. That he had gone, or had been called, after 1450 by Gutenberg to Mainz has been asserted but not proved, though there is no reason why he should not be one of the two Johannes alluded to as the *prothocaragmatici* of Mainz in the Justinian of 1468 (testimony viii.). That Nicolas Jenson came to be regarded in certain circles and for a time as the inventor of printing is owing to testimony xii. being misunderstood.

There remain, therefore, to be considered the testimonies which bear on the rival claims of Haarlem and Mainz. So far as we know, the controversy between Germany and Holland was publicly started as early as 1499 by the *Cologne Chronicle* (testimony xxiv.), that between the two towns mentioned not publicly before 1561 (testimony xli.); while the name of the Haarlem inventor was not mentioned publicly in print earlier than 1588 (testimony xliv.).

The claims of Germany and Mainz, as centred in the person of Johann Gutenberg, have been discussed above while treating of the early printing at Mainz. A few more words about these claims are necessary. Though some of the documents relating to him connect him with the art of printing, they say nothing of him as the inventor of it; nor do any of the books ascribed to him.

The first document that connects him with the art of printing, the notarial instrument of the 6th of November 1455 (testimony i.), says nothing of an invention or a new mode of printing. And yet the occasion was such as to make it almost imperative on Gutenberg to speak of his invention, if he had made any, for he had spent 1600 guilders of Fust's money for making " tools," apparently without printing anything,[2] and was on the point of being robbed by the latter and having taken away from him all that he is supposed to have made and done to give effect to his idea or invention. The next testimony (ii.) *i.e.* the earliest Mainz books with printed dates (1457 to 1467), shows that the art of printing was not treated as a secret at Mainz; it is openly proclaimed; its importance fully realized and appreciated, but it is distinctly advertised as a " by-invention of printing," and still more distinctly as a " *new art* of printing "; the public were informed that books were now no longer produced by means of the pen, but by a new art of forming characters and printing. Such advertisements are natural and appropriate if we assume that the new art of printing had recently (say about 1450 to 1455) become known at Mainz, but not when we assume that Gutenberg had been printing there devotional and school books and folio Bibles since 1443. But, though the new art is so distinctly described and advertised, in none of these advertisements is there one word of a " Mainz invention " or an " inventor." In testimony iii. (the *Catholicon* of 1460) there is an allusion to Mainz being favoured by God, but again not one word about an invention or an inventor. If Gutenberg had printed the *Catholicon*, it would be incredible that he, who had been wronged and robbed by his two rivals (Fust and Schoeffer), should join in with them in defining and proclaiming the new art, but never with one word assert his claim to the honour and profit of the invention, if he had made any, and should even omit his name, whereas he saw

[1] Over a hundred of them have been collected by Ger. Meerman, *Origines typogr.* ii. 58 seq.

[2] In line 42 Gutenberg distinctly declares that " he hoped he was under no obligation to Fust to devote the first 800 guilders to the work of the books "; and, as Fust, by advancing the second 800 guilders in 1452, had practically become Gutenberg's partner, it seems clear that the former claimed in October or November 1455, when the trial may be said to have commenced, his money and interest because Gutenberg had as yet not printed anything.

his two rivals never neglect to print their names in full on every book which they published. Those who believe that Gutenberg was the inventor of printing suggest that he kept silent, as otherwise his creditors would have seized his copies and his printing-office. But this explanation cannot be accepted, as we have seen that Gutenberg was practically bankrupt at that time, and prosecuted as a defaulter; and the verbose colophon at the end of a gigantic folio book like the *Catholicon*, published at a time when there were perhaps not more than three printing offices in the world, would be calculated to draw attention to its printer and his residence, not to conceal him. Testimony v. (1466) can no longer be regarded as having any reference to Gutenberg or the invention of printing; vii. (1468) was formerly thought to mean: "I, the book, am cast (*i.e.* its types are cast) in the Mainz city, and the house whence the type came (=where the type was invented) produced me." But of late years it has been shown that the author of the book, Johann Fons, was Peter Schoeffer's press-corrector. And, as he no doubt resided in Schoeffer's house, the two lines evidently mean: "I am a little book cast in Mainz, and I was born (=written) in the same house whence the type comes[1] (=where I am printed)." Testimony viii. (also of 1468) speaks of two Johannes (Gutenberg and Fust) as the "prothocaragmatici librorum quos genuit urbs Moguntina." But this means, not that the first printers of books were born at Mainz, but that the two Johannes (born) produced at Mainz were the chief printers of books.

When we now place together the clear documentary testimonies (i. to viii.) of the first fourteen years of printing (1454 to 1468) at Mainz, we see that they all come from Mainz itself. Everybody connected with the art when speaking of it does so in the most public and unreserved manner; its importance was as fully realized and advertised then as it is now; the German nation is even congratulated on possessing it; there is never any secrecy about it; but from the moment that it begins to be mentioned there (say about 1456) it is called a *new* art. In the midst of all this publicity, however, the *new* art which Mainz and Germany possess is never spoken of as having been *invented* at Mainz or anywhere else in Germany. The supposed Mainz inventor (Gutenberg) even speaks himself on two occasions (certainly in the lawsuit of 1455, and presumably in the *Catholicon* of 1460) but never says that he made an invention. The archbishop of Mainz, too, speaks publicly of Gutenberg in 1465 (testimony iv.), and rewards him for services, but does not speak of him as the inventor of printing, nor even as a printer. Nor does Dr Homery, in his letter to the archbishop (testimony vi. of 1468), in which he refers to Gutenberg's printing apparatus, call him the inventor of printing.

Mainz Testimonies, 1454-1468.

In 1468 we enter on a new phase in the history of the invention. Even if we set aside testimony viii. as being merely local, testimony ix. (1468) speaks of the art of printing as having arisen in Germany. This testimony, however, does not come from Germany, nor from Mainz, but from Italy, and is supposed to have been inspired by the two German printers who had established a printing-office at Subiaco in 1465, and in 1467 at Rome, and who most likely learned their craft at Mainz.

As the two printers are mentioned in the testimony, and as it does not speak of Gutenberg, nor of Mainz, it is far more likely that it was merely derived from the colophons of Fust and Schoeffer, or from something that Cardinal Cusa had heard during his embassies in Germany. To the Mainz colophons we must also ascribe (*a*) the two testimonies of 1470 (x.) and (*b*) the three of 1471 (xi.), all five of which come from France and Italy. At last, in 1472 (testimony xiii.), the invention of printing is ascribed to Gutenberg of Mainz, but as a rumour, and the testimony comes from France. Guil. Fichet of Paris, who gives it, is supposed to have heard the rumour from the three German printers who commenced printing at Paris in 1470. And as two of them had resided, immediately before they came to Paris, in the university of Basel, and are supposed to have learnt their art there, the rumour is traced to "Bertolff von Hanauwe," who appears in the lawsuit of 1455 as Gutenberg's servant and who was printing at Basel in 1468. But it came more likely from information which Fichet obtained from the St Victor Cathedral, near Mainz (of which Gutenberg had been a lay member), as he speaks of the art having been invented "not far from that town." Testimony xiv. (1474) again comes from Italy, from Rome, and was perhaps derived from one of the German printers settled there at that time. It merely speaks of Gutenberg, Fust and Mentelin as printers, but says not a word which even touches upon the invention of the art. In testimony xv. (1476) we have the first definite mention of Mainz as the inventress of the art; it is given as an addition to the Mainz colophon of 1468 (see viii.). In 1478 Mainz is again mentioned in a Cologne testimony (xvi.) which gives evidence of research, as it is an amplification of an earlier one in which Mainz was not mentioned. Germany, Gutenberg and Mainz are again mentioned in the Venetian testimony xvii. (1483), which gives (under the year 1457) for the first time 1440 as the date of the invention. In the same year we have two earlier testimonies (xiv. and xii.) worked into one (xviii.), to the effect that printing was invented either by Gutenberg or by Fust or by Jenson. Testimony xix. (1492), which states that printing commenced at Mainz, is practically equivalent to xv. In 1494 and 1499 we have three German testimonies (xx., xxi., xxii.) as to Gutenberg being the inventor of printing; these, however, come, not from Mainz, but from Heidelberg; xxii. is given by a relative of Gutenberg, Adam Gelthus, and, as the latter resided at Heidelberg, it is clear that he was the real source of the other two Heidelberg testimonies (xx. and xxi.). Two years later, when Wimpheling, the author of testimony xxi., had left Heidelberg, he ascribed (xxv.) the invention of printing to Strassburg, though stating that Gutenberg was the inventor. Testimony xxiii. is recorded above to show the confusion that reigned in people's minds about 1500 regarding the invention. We must add to these testimonies those of 1504 (xxvii.) and 1505 (xxviii.), which are owing to Ivo Wittig, a canon and the keeper of the seals of the St Victor Cathedral, near Mainz, of which, according to its *liber fraternitatis*, Gutenberg had been a lay member.

Thus the Helmasperger document, the two Indulgences of 1454 and the 42-line Bible tell us, that in the period from August 1450 to 1456 the art of printing had commenced and been perfected at Mainz; but not a word is heard as to how it arose, or what its nature was. In the period from 1456 (if we place Schoeffer's 35-line *Donatus* in this year) to 1468 various books were printed at Mainz with colophons in which the art of printing is proclaimed as a by-invention of printing; more especially as a *new* art; its mechanism is fully described and said to be quite different from the mode of producing books by means of the pen; but, no one says that it was *invented* at Mainz, or mentions the name of a Mainz *inventor*.

In the period from 1468 to 1505, however, we have (1) several vague statements made in Italy and France as to the art of printing being known or practised or invented in Germany, statements which arose from the books and colophons published at Mainz; (2) one item of rumour in 1472 that Gutenberg invented it *near* that town; (3) two Mainz statements, of 1476 and 1492, and one Cologne statement, of 1478, that it was invented at Mainz; (4) three German statements, of 1492, 1494 and 1499, that Gutenberg had invented it; and (5) two Mainz statements, of 1504 and 1505, to the same effect. But it is to be particularly noticed that the statements (2, 4, 5), which speak distinctly of Gutenberg being the inventor, can be clearly traced to the St Victor Cathedral, that is, to Gutenberg himself and one of his relatives.

Seeing then how slender the basis is for the assertion that printing was invented by Gutenberg at Mainz, that even this slender basis was not laid till fourteen years after the art had been fully established and proclaimed in that city, and that it may be traced to Gutenberg himself, we cannot be surprised to find it promptly contradicted, not in Holland, but in Germany itself.

Contradiction of Gutenberg's Claims.

This contradiction was made in 1499 (testimony xxiv.) in a *Chronicle* published at Cologne. To facilitate the understanding of this testimony it is divided above into eight sections. The first (taken from Hartmann Schedel's *Chronicle*, 1493), second, sixth, seventh and eighth are no doubt due to the compiler of the *Chronicle*, and must not be connected with the third, fourth and fifth, which, according to the compiler, are due to Ulrich Zell, a printer at Cologne, who had probably settled there about 1463, and had most likely learnt his art at Mainz, as he called himself "clericus moguntinus." As Zell's testimony leaves to Gutenberg nothing but the honour of having *perfected* the art, various attempts have been made to explain away this account. As long as no typographically printed *Donatus* had been found that could be fitted into Zell's account it was argued that he meant a *Donatus* printed from wooden blocks; and this argument is brought forward even at the present time. But a practical printer like Zell must have been able to express himself to that effect if he had really meant to say so; and, as block-printing was not less practised in Germany than in Holland, we could hardly assume that blockbooks printed in Holland would have inspired the German inventor rather than the same books printed in Germany. That testimony xxxviii. speaks of a *Donatus* printed from wooden blocks may be ascribed to the notion arising at that time (*c.* 1533) that block-printing had given rise to typography. It has also been remarked that unless we take Zell to refer to a *Donatus* xylographically printed in Holland, the passage in the *Chronicle* would be contradictory, as it says in its first and sixth section that the art of printing was found first of all at Mainz about 1440, by a Mainz citizen, Junker Johan Gudenburch, and then in its fourth that the art had already been found before that time in another place. But if the fourth section is read in accordance with its punctuation in the *Chronicle* itself, it says clearly that the art was found at Mainz, *as aforesaid* in the manner in which it is generally employed *now*, that is, more masterly, more artistic than in the *Donatuses* printed in Holland. It has further been asserted that Holland in the *Chronicle* means Flanders; but the *Chronicle* is usually correct in geographical matters, and is

[1] Venit (comes), the present not the perfect tense (has come).

therefore not likely to have gone astray in this particular case. It has also been suggested that Zell most likely learnt his art in Fust and Schoeffer's office and invented the passage to injure the reputation of Gutenberg, who had been their enemy. Finally it has been said that Zell did not suggest or write the passage at all; but it is hard to see how this can be maintained in face of the compiler's own statement to that effect.

As, therefore, all these suggestions do not weaken or invalidate Zell's testimony, we must see how far it harmonizes with other circumstances and the testimonies xxxiv., xli. to xlix., which claim the honour of the invention for Haarlem in Holland

Lourens Coster's Claims.

Testimony xxxiv. (the Pedigree) is sufficiently clear as to the invention of printing at Haarlem, the supposed date and the name of its inventor. Testimonies xli. and xlii., though coming from Haarlem, do not mention the name of the inventor. But xli. is a mere introduction destined for a complete book that seems to have been lost during the siege of Haarlem in 1573 before it was printed; we are, therefore, not justified in saying that Van Zuren did not know the name; xlii. may have omitted the name, because the publication of Van Zuren's work was in contemplation at the time that it was written. That Guicciardini (testimony xliii.) in 1566 did not mention the name of the reputed Haarlem inventor cannot be considered as an indication that it was not known or had not yet been "invented" when he wrote, as his accounts of the cities of the northern Netherlands are all rather meagre and for the most part derived from correspondence. He and other authors coming after him (testimonies xlv.–xlvii.) state that the Haarlem inventor had died before the art was perfected, and that thereupon his servant had brought it to perfection at Mainz. We do not find any such statement in Junius. The latter's account (xliv.), however, gives various particulars as regards the inventor and his invention. He begins by referring to the difficulty of vindicating the honour of the invention for Haarlem on account of the deep-rooted and general opinion that it took place at Mainz. He then mentions that Lourens (son of Jan) surnamed Coster resided at Haarlem "more than 128 years ago," and gives us to understand that in the year indicated by that phrase he invented the art of printing. Junius's book was not published till after his death, in 1588, but its two prefaces are dated 1575 (he died June 16, 1575), hence the number 128 is supposed to go back from the date when he actually wrote his account, which he is calculated to have done about 1568. Thus we get the year 1440 as the supposed date of the Haarlem invention, though, if we based our calculation upon the date of the preface, the year 1446 or 1447 would have to be assumed. But, as Junius adds that Coster's types were stolen by one of his servants, who fled with them to Mainz, and, establishing there a printing-office, printed within a year's time, in 1442, two books, he must, if this latter date is correct, have meant 1440. By testimonies xlix. and l. we see that in the 17th century the date of the Haarlem invention was first put back as far as 1428, then to 1420; and since then it has usually been regarded as 1420–1423, especially after it was discovered that the Haarlem wood where Coster is said to have cut his wooden letters was destroyed during a siege in 1426.

The researches regarding the reputed Haarlem inventor have hitherto been made in an inadequately scientific manner, and it appears that, after Scriverius (1628) had pushed back, in spite of Junius, the date of the invention to 1420–1428, he and later Dutch authors on the subject mixed up two Haarlem citizens (*a*) Lourens Janszoon, who never bore the surname Coster: he is proved to have been sheriff, wine merchant and innkeeper from 1404 to 1439, and to have died in the latter year; (*b*) Lourens Janszoon Coster, authenticated by official documents as a chandler and innkeeper from 1436 to 1483, leaving Haarlem in the latter year. The name of this person and some genealogical particulars known of him seemed to agree with Junius's account and the Coster pedigree.

But recent investigations at Haarlem and elsewhere tend to show that there have been two, if not three, persons of this name living at Haarlem about the same time. Though this superabundance of namesakes shows that van der Linde and those who accepted his conclusions were rather hasty in declaring L. J. Coster to be a myth, it is somewhat perplexing to the historian, and it would seem that the Dutch people prefer to make speculations and guesses on this point, rather than search in some systematic way the original documents and registers from which they draw haphazard extracts. The result of the latest inquiries (so far as they may be called inquiries) is that L. J. Coster, who would agree with Junius's account and the Haarlem Coster pedigree, was a member of a Christmas-gild in 1436, is mentioned in the Haarlem registers as a dealer in candles and oil till 1454, and seems to have died before 1460 (see Fruin, *De huidige stand van het Costervraagstuk*, 1906; Enschedé, *Laurens Jansz. Coster*, 1904); so that his business as printer was probably continued by one of his relatives, and finally broken up about 1481, when the *Speculum* cuts are in the hands of Veldener.

Junius's account of the Haarlem invention is based on three books: (1) a Dutch edition of the *Speculum humanae salvationis*; (2) the *Doctrinale* of Alexander Gallus; and (3) the *Tracts* of Petrus Hispanus (Pope John XXI.). The first work, he said, was printed by Coster as a first specimen of his art, and it would seem from his words that the tradition believed it to be printed with wooden types; the second and third books, he declares, were printed at Mainz with Coster's types, stolen from him by his workman. Of the Hispanus *Tracts* no edition answering to Junius's description has as yet come to light. Of the *Doctrinale* and the *Speculum* we possess editions which fit into his account, though, of course, it will be impossible to say whether any of the *Doctrinale* editions were printed at Haarlem or at Mainz. Various editions of the Latin grammar of Aelius Donatus, printed in the same types, link Junius's independent testimony regarding Haarlem and Coster on to that of Ulrich Zell, who declares in the *Cologne Chronicle* of 1499 that editions of this school book printed in Holland were the models (prefiguration) for the printing at Mainz, which commenced about 1450.

As the evidence for Haarlem's claims has been obscured by various adverse and not always intelligent criticisms, and no less by imperfect and incorrect descriptions of the books on which they rest, we describe here, from autopsy, the types and books that have always been and still may be, on solid grounds, attributed to Coster, and which, for this reason, we continue to call Costeriana.

Costeriana.

The Costeriana. Xylographic Printing.

Of the *Speculum humanae salvationis*, a folio Latin blockbook (that is, an edition printed entirely from wooden blocks) must have been printed several years before 1471, consisting, like the later type-printed Latin editions, of at least 32 sheets = 64 leaves, all printed on one side of the leaf only, alternately on the versos or rectos (therefore 64 printed pages). The sheets were, no doubt, arranged in the same number of quires (a^3 for the preface; bcd^7, e^8 = 29 sheets for the text) as in the later editions; the first leaf was perhaps blank, the preface occupied the leaves 2 to 6, and 58 leaves remained for the 29 chapters of text, each occupying two opposite pages of two columns each. We may further assume that the upper part of each printed page of the text was occupied by one of the woodcuts, which we know from the later editions, and which are divided each into two compartments or scenes by a pillar, with a line or legend below each compartment explaining, in Latin, the subject of the engraving; and that underneath the woodcut was the text, in two columns, corresponding to the two divisions of the engraving above.

This blockbook has already been alluded to above among the Netherlandish blockbooks, but we give here further details, as various circumstances make it clear that it was the work of the same (Haarlem) printer who issued the other editions of the *Speculum*, together with the several incunabula described below, and to whom a Haarlem tradition ascribes the invention of printing.

All the *Speculum* editions which concern us contain, so far as we know, 29 chapters. But previous to the above blockbook another one of more than 29 chapters (may be 45, like most of the MSS.) must have existed, as may be inferred from Johan Veldener's 4to edition of a Dutch version of the *Speculum*, published in 1483, in which all the 58 blocks of the old folio editions reappear cut up into 116 halves to suit this smaller edition, besides twelve additional woodcuts for three additional chapters (the 25th, 28th and 29th) not found in any of the old folio editions. As these additional woodcuts appear to be also cut-up halves of six larger blocks, they point to the existence, at some earlier period, of a folio edition (xylochirographic or xylographic?) of at least 32 chapters, at present unknown to us.

Of the blockbook as is here assumed we know now only 10 sheets or 20 leaves, which, in combination with 22 sheets or 44 typographically printed leaves, make up an edition, called, on account of this mixture of xylography and typography, the *mixed* Latin edition. These twenty xylographic leaves are (counting the 6 leaves of the type-printed preface) 7+20, 8+19, 10+17, 11+16, 12+15, 13+14 (in quire *b*); 22+33, 23+32, 27+28 (in quire *c*); 52+61 (in quire *e*).

Copies of this *mixed* Latin edition still existing: (1) Bodleian Library, Oxford (Douce collection, 205), perfect; (2 and 3) Paris National Library, 2 copies, one perfect, the other wanting the first (blank) leaf; (4) John Rylands Library at Manchester (Spencer collection), wanting the first (blank) leaf; (5) Colonel Geo. Lindsay Holford, London, wanting the first (blank) leaf; (6) British Museum (Grenville collection), wanting the leaves 1 (blank) and 21 (this being supplied in facsimile); (7) Royal Public Library at Hanover, wanting the leaves 19 (xylogr.) and 24 (typ.), but having duplicates of the (xylogr.) leaves 15 and 28; (8) Museum Meerman-Westreenen, the Hague, wanting the leaves 1 to 36, and portions of the text of leaves 37 and 38; (9) Berlin Royal Library, wanting the leaves 1 (blank), 58, 59, 62, 63, 64, while in place of the (xylogr.) leaves 52 and 61 it has the same (type-printed) leaves of the second Latin edition; several of the other leaves are bound in a wrong order; (10) Pembroke library at Wilton House, wanting the leaves 1 to 7 and 64, while the leaves 9 + 18 have been supplied from the second (type-printed) Latin edition; (11) Copy, represented now by the leaves 15 + 28, which appear as duplicates in the Hanover copy (above, No. 7); (12) Ottley (*Invention of Printing*, p. 287) mentions another copy as having belonged to Mr Singer, which wanted three or four leaves, but has since been taken to pieces and dispersed. See further Holtrop, *Cat. bibl. reg. Hag.* 560; idem, *Mon. typ.* p. 22 and facs. pls. 20, 21; Bernard, *Orig.* i. 13 sqq.; Sotheby i. pl. xxxii.; Campbell, *Ann.* No. 1570 (who wrongly states that the two copies in the Paris National Library belong to the *unmixed* Latin edition).

Efforts have from time to time been made to account for the unusual mixture of xylography and typography in this one book, and to assign a date to it and the other editions, with the further view of ascertaining the date of their printer, as for him the honour of the invention of printing is claimed. Bernard (1853) was uncertain as to the chronological order to be assigned to the various editions, but, without stating his reasons, concluded that at least six or seven must have been issued, and that the *xylographic* leaves of the *mixed Latin* (his edition A), are the remains of a *first* complete, entirely *xylographic* edition. As there is a close resemblance between the letters of the xylographic and typographic texts, and both texts agree, with a few exceptions, word for word with the corresponding texts of the other Latin edition (which, being wholly typographical, is called the *unmixed Latin*), Ottley in 1816 concluded that the xylographic pages were facsimiles from those of the typographically printed *unmixed* Latin edition, which the publisher caused to be made after having lost, through some accident in his office, not only those sheets already typographically printed, but also his types. In support of this theory he pointed to some defects or breakages in the pillars, dresses, &c., of the woodcuts of the xylographic pages which he did not find in the same woodcuts in the *unmixed* Latin edition; so that he thought the latter must be the first edition. Secondly, as the scrolls in the last vignette (Daniel interpreting the handwriting on the wall) are black in the Inglis copy of the *unmixed* Latin edition, but white in all the copies of the *mixed* Latin and the other editions, he concluded that the former must have been printed before the woodcutter had cut away the piece of wood which produced the black scroll, which was to him an additional proof that the *unmixed* Latin edition was the first. These theories were adopted by Sotheby in 1858 and again by Schreiber in two treatises on xylography (in *Centralbl.*, 1895, p. 20 sqq.; in the Gutenberg-Festschrift, *Centralbl.*, 1900, p. 46 sqq.; and in his *Manuel de la gravure sur bois*, 1902, iv. 114 sqq., vii. pls. 48, 49, viii. pls. 79, 80). The latter author is of opinion that xylography was not employed for the multiplication of books till about 1468–1470, and that about that time printing with movable metal types was almost unknown in the Netherlands. Hence he thinks that the woodcut illustrations in the various editions of the *Speculum* were printed somewhere in the Netherlands, and the sheets afterwards sent to Germany, most likely to Cologne, for the purpose of having the texts added by typography. These proceedings, he fancies, were successful twice, once with what he calls the first (*unmixed*) Latin, secondly with the first Dutch edition, but on the third return journey a part of the material of the second (*mixed*) Latin edition, that is the ten sheets in question, all packed in one parcel, were lost, and the publisher, in a hurry to sell his copies, had these sheets replaced by xylography.

Bernard.

Ottley.

As a careful examination of the *mixed* Latin and other editions clearly shows their real condition and the order of their issue, we do not discuss Schreiber's improbable theories. As to those of Ottley and Sotheby, some of the lines which they regarded as broken in the copy or copies of the *mixed* Latin edition which they examined, are intact in other copies of the same edition, so that no reliance can be placed on these defects and breakages, which are clearly due to printing from wooden blocks, a process which admittedly causes more defects in the impressions than printing from types. Of the black and white scrolls we speak below.

It is to be noticed first of all that the legends underneath the woodcuts are in Latin, so that they were no doubt engraved for a *Latin edition.* But, unless we take the twenty xylographic leaves as remains of a complete xylographic edition issued (at Haarlem) before the invention of printing, there would be no Latin edition to connect the woodcuts with in the first instance, as the primitive types and workmanship of one, if not two, of the Dutch editions described below show that these must have been printed before the 44 type-printed leaves of the *mixed* Latin edition, and also before the wholly type-printed *unmixed* Latin edition, the types of which are new and far better cast.

Incidentally, this fact that the types of the *mixed* Latin edition are *later* than those of the Dutch editions disposes also of another theory favoured by some authors, viz. that during the progress of the xylographic edition its printer invented the movable type, and thereupon stopped his xylographic work to complete the book by means of type, so that in this *mixed* Latin edition we were to see the transition from xylography to typography.

The priority of the xylographic over the typographic leaves is proved by the Pembroke (No. 10) and Berlin (No. 9) copies. In the former the third sheet of quire *b* (=the leaves 9 + 18 with the figures 5, 6 and 23, 24), the only type-printed sheet in this quire in the other copies (1 to 7 and 9), is not the same as in the other copies, but belongs to the *unmixed* or second Latin edition.[1]

A somewhat similar but still more important manipulation we observe in the Berlin copy, in which the *fourth* sheet of quire *e* (=the leaves 52 and 61), the only xylographic sheet in this quire in the other copies, is replaced by the corresponding type-printed sheet of the *unmixed* or second Latin edition.

All this makes it clear that the printer of the *Speculum*, some time after having become a type-printer instead of a block-printer, replaced gradually (or by one operation), forty-four xylographically printed leaves of his first edition by type-printed leaves, for the purpose of issuing the Latin edition, now known as the *mixed* Latin edition; then, at a later stage, prepared a new Latin edition, wholly printed in movable type (now known as the *unmixed* Latin edition), and afterwards used sheets of this latest edition, not only to replace more of his old xylographic sheets (as in the Berlin copy), but even (as in the Pembroke copy) some of the forty-four sheets which he had printed (evidently for no more copies than he calculated to have left of the old xylographic stock), in the first instance, for issuing the *mixed* Latin edition. We shall see below that he proceeded in a somewhat similar way in completing copies of his Dutch editions.

Hence the sequence of the Latin editions was thus: (1) The *xylographic* edition of 64 (?) or more leaves in 29 (?) or more chapters, of which we have only 20 leaves remaining, which was issued before the invention of printing with movable types, and was probably preceded in its turn by a *xylographic* or *xylo-chirographic* edition of at least 32 or more chapters; (2) another issue of 20 leaves of the preceding edition, in combination with 44 typographic leaves (the *mixed* Latin edition) printed for the purpose of replacing the corresponding xylographic leaves of the preceding edition, considered unfit for further publication, or discarded for other reasons; (3) the wholly typographically printed edition known as the *unmixed* Latin edition.

This clear sequence of the Latin makes it easy to explain that of the other editions of the *Speculum.*

Typographic Printing.

(*Speculum* type 1).—First edition of a Dutch translation of the *Speculum*, with the title *Spieghel der menschliker behoudenisse*, hitherto called the *first*, or the *unmixed*, Dutch edition, or the Dutch edition in one fount of type. *First issue* entirely printed in type 1.

Judging by this and the third, the editions of the Dutch version of the *Speculum* must have had the same number of sheets, arranged (woodcuts and text) in the same way, as the *mixed* and *unmixed* Latin editions, with the exception of the preface, which required only 2 sheets (=4 leaves). Hence complete copies consist of the quires a^2 (prefatory matter), bcd^7, e^8 = 31 sheets or 62 leaves.

Holtrop, who gives a facsimile of one of its pages (*Mon.* pl. 22), regarded this edition as the last of all the *Speculum* editions, because he thought the type to be identical with that employed for the other editions, only here more used up. Bernard, however, saw that it was a different fount, and there can be no doubt that it is; it differs in form and size from *Speculum* type 2 as well as from type 3, though it has all the characteristics and the family likeness of the two. Most of the letters might even be regarded as identical with those of type 3, if they were not slightly smaller. That it looks old and battered seems to be owing to bad ink having been used for the printing; it was, however, badly engraved and badly cast, for not one line in the book runs straight. For this reason alone this edition is to be placed before the next two, which are printed with a better type, especially the third. There are, however, more reasons for doing this. First of all, leaf 46 (with the figures 83: *Semey*, and 84: *Rex amon*) of Lord Pembroke's copy belongs to the 3rd edition (in *Speculum* type 3), so that the present edition, to which the Pembroke copy belongs, must have existed earlier. It appears from Holtrop's facsimile (*Mon.* pl. 22) that leaf 46 was duly printed in type 1 like the other leaves of this edition. But the leaf 46, from which he took his facsimile, is an isolated one which found its way into the Meerman Museum at the Hague, but is wanting in the copy of the Communal Library at Lille. Hence this particular leaf is, perhaps, a cancel meant to be replaced (in the Lille copy) by another one of the 3rd edition, as in the Pembroke copy. The corresponding leaf of this sheet (33, with the figures 57: *Cristus fleuit*, and 58: Jeremias) is wanting in the Pembroke copy, so that we can obtain no further information. Another reason for placing this edition before the 3rd is found in the Haarlem copy (No. 5), the leaves 24 + 27, 25 + 26 of which also belong to the (3rd) edition, and were apparently meant to replace in that copy the corresponding leaves of this edition, which

[1] The Pembroke copy has this additional peculiarity that these leaves 9 + 18 consist each of two separate slips, one having the engraving, the other the text, the latter being pasted on to the bottom part of the former slip.

may have been lost, or the stock of which had become exhausted. Similar manipulations we have noticed above, type-printed leaves having been used to replace earlier xylographic leaves, and again below in the 3rd edition leaves of another edition are found.

Hence we must distinguish between at least three issues of this edition; the *first*, with the whole text printed in *Speculum* type 1; the *second*, with sheet 46 of the 3rd Dutch edition; the *third*, with the leaves 24 to 27 of the 3rd Dutch edition. Copies of the first issue: (1) Communal Library at Lille, wanting the leaves 33 and 46 (which latter are probably now in the Meerman Museum at the Hague), and showing several peculiarities;[1] (2) Haarlem Town Library (No. 4), wanting the leaves 2 and 3, besides the woodcuts (figures 7, 8 and 21, 22) belonging to the leaves 8 and 15. The sheets of this copy have all been cut up into halves, mounted on other larger sheets, and so bound in one volume, together with a copy of the *Liber Alexandri Magni*, printed at Utrecht by Ketelaer and De Leempt, and of Pet. Scriverius' *Laurecrans*, both mounted in the same way. There is no rubrication. *Second* issue: (3) Lord Pembroke's copy, which was completed by leaf 46 of the 3rd Dutch edition. Besides wanting the original leaf 46 in type 2, this copy also wants the leaves 32, 33, 54 and 55. It shows, moreover, these peculiarities, that on the recto of leaf 7 and the verso of the corresponding leaf 16 (therefore, on the verso of the third sheet of quire *b*) are illegible sets-off of the texts of two other pages, or, perhaps, they are faulty impressions of the leaves 8 and 15, which, in the Haarlem copies, seem to be reprints. *Third* issue: (4) Haarlem Town Library (No. 5), wanting the leaves 20 + 31, 21 + 30, 22 + 29, 23 + 28, while its leaves 24 + 27, 25 + 26 belong to the *third* (formerly called *second*) Dutch edition (in *Speculum* type 3). It has, moreover, this peculiarity that the fourth sheet of quire *b* (=the leaves 8 + 15, with the figures 7, 8 and 21, 22), consists of two separate slips of paper, one containing the impression of the engravings, the other that of the text, the latter slip being pasted on the former, while underneath the figures 7 and 8 are still visible the blind impressions of the two top lines (on the corresponding leaf even 3 lines) of the old discarded letterpress. Seeing that the other copy at Haarlem has the text of these leaves, but not their engravings, it would seem that the letterpress had failed, that is, it had been impressed on the paper without its having been inked.

It is clear from all these manipulations in the copies of this edition, that its printer was inexperienced; moreover, considering its defective type, &c., it is necessary to give it precedence to all the other types and to place this edition immediately after the xylographic edition.

(*Speculum* type 2).—Second (?) edition of the Dutch version of the *Speculum*, at present only known from one sheet (the 26th) = the two leaves 49 (with the figures 89: *Xpūs crucifixus* and 90: *Inventores artis*) and 60 (with the figures 111: *Exitus ione* and 112: *Lapis reprobatus*), that is, the third sheet of quire *e*, found in all the existing copies of the Dutch edition (in the *Speculum* type 3), called the *mixed Dutch* edition, on account of its having these two leaves, printed in a different type, bound up with the others.

The type (on which see Holtrop, *Mon.* pl. 19, and Ottley, *Inquiry*, i. 249) used for these two leaves is slightly smaller than the *Speculum* type 3, and differs from it and from *Speculum* type 1 in several respects, though there is a great family likeness between all three. We place it before type 3 because the letters ba, be, ha, he, hē, ho, pe, pē, ve, &c., are cast in pairs on one body of type, which combinations appear no longer in type 3. Moreover it looks so primitive, uneven and used up that its proper place would almost seem to be before *Speculum* type 1, although the latter's uneven, wobbling condition suggests its priority. Further, its look and "ductus litterarum" bear such a singular likeness to the *Valla* type (mentioned below) that it seems reasonable to place it as near to that type as possible. Under ordinary circumstances these two leaves might be regarded as *later impressions* for completing the edition in which they occur. Ottley and others regarded them as replacing earlier leaves which, by some accident in the printing-office, had got lost or spoiled. But why should a printer use an old, quaint-looking type for printing and reprinting, with differences, one sheet for a book which he had printed entirely with a new and better type employed for many other works? We rather assume that the leaves are the remains of a complete (the second Dutch?) edition in *Speculum* type 2 and were used on this occasion as substitutes for the two corresponding leaves of the third edition, which had become defective or momentarily unavailable.

Differences in the text of the second column of leaf 60 between Meerman's copy and the Spencer Rylands and (Enschedé) Crawford copies (see Meerman, *Origg. typ.* i. 121, note cl., and facs. on pl. vi. 3rd div.; also Holtrop *Mon.* pl. 19, sec. col.) point to another edition printed in this same type. We therefore distinguish between one edition represented by the Meerman-Westreenen copy, and another represented by the two other copies, without being able to say which of the two is the earlier.

No other trace of this type has hitherto been found, but as it looks old and used up, it seems reasonable to suggest that it must have been employed not only for printing one or more editions of the *Speculum*, but for other books not yet known to us. It bears a singular likeness to the *Valla* type mentioned below, and some of the capitals seem almost identical.

(*Speculum* type 3). (1) The (*second*, or *third*, but) *first type-printed Latin* edition of the *Speculum*, or rather of 22 of its sheets (=44 leaves), printed on one side only, in a type which is newer, and therefore later than the above types 1 and 2, and, for that reason, here called *Speculum* type 3. It has hitherto been called *the Speculum* type, as it was thought that all the editions of the *Speculum* were printed in one and the same type; type 1 being considered identical with 3, while of type 2, regarded as a stray one, no account was taken. The 22 type-printed sheets of this edition are only found in combination with the 10 sheets (20 leaves) printed entirely (figures and text) from wooden blocks, described above; and the edition so made up is, on account of this mixture of xylography and typography, called the *mixed* Latin edition. The type-printed leaves are 1 (blank) + 6, 2 + 5, 3 + 4 (quire *a*, preface); 9 + 18 (of quire *b*); 21 + 34, 24 + 31, 25 + 30, 26 + 29 (of quire *c*); the whole quire *d* (leaves 35 + 48, 36 + 47, 37 + 46, 38 + 45, 39 + 44, 40 + 43, 41 + 42); and the leaves 49 + 64, 50 + 63, 51 + 62, 53 + 60, 54 + 59, 55 + 58, 56 + 57 of quire *e*. The copies of this edition, still in existence, with all the particulars related to them, have been enumerated above.

(2) The *third* (hitherto called the *second*) *Dutch* edition; also called the *mixed Dutch* edition, or the *Dutch edition in two types*, two of its leaves (49 and 60) being printed in a different type (see above, *Speculum* type 2). This edition is arranged in the same way as the first and second, and consists therefore of 62 leaves. Copies: 1. John Rylands Library, Manchester (Spencer collection), perfect; (2) Lord Crawford's library, perfect; (3), Museum Meerman, the Hague, perfect; (4) Geneva Public Library.

(3) The (*third*, or *fourth*, but) *second type-printed Latin* edition, usually called the *unmixed* Latin edition, it being printed throughout in one type (3). It contains 64 leaves, printed on one side and arranged in the same number of quires as the *mixed* Latin edition. But under figure 100 (column 100) it has a line (5th) which is wanting in the first (*mixed*) Latin edition, and the final word of line 4 is correctly printed *corporali*, not *spirituali* as in the *mixed* Latin. Moreover, line 10 in col. 104 has the final word *egipti*, which is wanting in the mixed Latin, and line 6 in col. 62 has the correct final word *terrestris* instead of *celestis* as in the mixed Latin. (See also Holtrop, BRH. 561; Sotheby, i. 145; Bernard, i. 17; Facs. in Holtrop, *Mon.* pls. 17, 19; Sotheby, i. pls. xxix. and xxx.). Copies: (1) The Hague, Museum Meerman-Westreenen, wanting the first six leaves of the preface. A separate impression of the engraving (*Semey maledicit* + *Rex amon*) of leaf 48 is pasted on the lower part of the same cut, which had been printed with the text in the first instance, but defectively (Holtrop, *Mon.* p. 20, and pl. 17); (2) Florence, Royal National Library, formerly in the Pitti Palace, wanting the first (blank) leaf and having also a separate impression of the engraving of leaf 48, but here the text seems to have failed and is pasted on the engraving; (3) Stuttgart, Landesbibliothek, wanting the first (blank) leaf; (4) Munich, Hofbibliothek (pressmark Xyl. 4to No. 37) wanting the first (blank) leaf; (5) Vienna, Hofbibliothek (pressmark Inc. 2 D 19) wanting the first (blank) leaf; (6) [John B. Inglis, bought by Mr Quaritch, and now in] the Lennox library; (7) Haarlem, Town Library (No. 8), wanting the preface (leaves 1 to 6); (8) Brussels, Royal Library, wanting, besides the first (blank) leaf, the second and third sheet of quire *b* (leaves 8 + 19, 9 + 18), and the second half of the fourth sheet (leaf 31) of quire *c*; (9) Hanover, Royal Library, wanting 18 leaves, that is, the first four, and the whole quire *d* (leaves 34 to 48); (10) Munich, University Library (pressmark Xyl. 10), wanting the four leaves 1 (blank), 54, 55 and 59. In this copy Schreiber (*Centralbl.* 1895, p. 208) discovered the date 1471, in old arabic numerals in rubrics, underneath the blind impression of some line after the last line of the Prohemium. The date is repeated by a hand of the 18th century, in modern arabic numerals, underneath the old date, by way of

[1] The fourth sheet of quire *b* (leaves 8 and 15) consists of two separate slips of paper, one containing the engravings, the other the text, the latter being pasted on the former. The fifth sheet of quire *c* (=leaves 23 and 28) is in the same condition. But these slips are not, like the former, pasted one on the other, but the pieces of leaf 23 are pasted on a small, apparently old, slip of paper, another newer piece of paper having been pasted on to the outer margin to strengthen the old piece. The slips of leaf 28 are pasted together by a slip of modern paper on the back, from which it would appear that they had been left loose when the volume was issued. Further the 7th or centre sheet of this same quire *c* (leaves 25 and 26) is bound wrongly in the place of the first sheet of quire *d* (leaves 33 and 46), which is wanting in this copy, so that leaf 25 follows after leaf 32, taking the place of the missing leaf 33, while leaf 26 follows after leaf 45, taking the place of the missing leaf 46 (now at the Hague). But on leaf 25^a, which should be blank, is an impression of the text belonging to leaf 62^a, but not of the figures (115, 116), while on leaf 26, which should also be blank, is now the text belonging to leaf 47, but without its figures (85 and 86). Hence the text of these pages (62^a and 47^b) occurs twice in this copy, first on the leaves 25^a and 26^b, and secondly in their proper place. These peculiarities seem to show that the letterpress was printed first, and that in this case a mistake was made in the first instance, but discovered when the figures were printed.

explanation; (11) Library of the Royal Gymnasium at Freiberg in Sachsen, where the 14 leaves of quire *c* are said to be preserved, but which in June 1908 could not be found

In the Florence, Munich (University Library), Vienna and (Inglis) Lennox copies, all four belonging to this (*unmixed*) Latin edition, the three scrolls on the last vignette of the book (over col. 116), representing Daniel before Belshazzar, and the "handwriting on the wall," appear *black* (see Sotheby, *Principia typogr.* i. pl. xxx., xxxvii., xxxviii.), but blank in all other copies of this and the other editions. From this fact some authors have concluded that the *unmixed* Latin edition, here called the *last*, was, in reality, the *first*, as the black scrolls show that the pieces of wood which caused these black impressions had not yet been cut away when the copies were printed off. But as its type and other circumstances connected with this *unmixed* Latin edition make it impossible to regard it as the first, we have to look for another explanation of these black scrolls. First of all, scrolls, especially scrolls proceeding from the mouth of some individual, were already common in the pictures or illustrations of the manuscript- and block-printing periods, just as they are now. They were then, as they are now, intended in all cases to convey to the reader some memorable saying, quotation, inscription or motto. As black scrolls, therefore, could have had no object, we should have to assume that the practised engraver of the *Speculum* had prepared this last engraving carelessly and only saw his mistake after some copies had been printed off, which yet he allowed to pass into circulation. In some copies the Bible words *Mane thecel phares* have been written in the blank scrolls, as was to be expected; other copies vary this by adding the Latin interpretations, *numerus, appensio, divisio.* But in one of the Haarlem copies the scrolls have been coloured yellow with a brush, and it would seem that to some such operation the black scrolls are due; the colour in none of the impressions looks exactly like that of the vignette. It is, however, more than probable that, for some purpose or another, some of these scrolls were intended to be black, and that, while they were printed, something was placed in the block in the hollow of the scrolls to produce a black impression.

Sotheby, in his *Principia typogr.* p. 178 sqq., calls attention to an imitation of this *Speculum* vignette by Jacobus de Breda, who began printing at Deventer about 1483. This imitation (having one scroll which proceeds from the mouth of a figure supposed to represent Jacobus himself) he used for the first (?) time in Matthaei Bossi *Sermo*, *c.* 1491, the *scroll* being blank. But when he uses the engraving for the second (?) time, in *P. Ovidi Naso. metamor. Liber Secundus*, *c.* 1493 (copy in the Cambridge University Library), his name, "Jacob' de Breda" appears in the scroll (upside down when reading from right to left). A *third* time the vignette appears in his edition of *Pub. Ov. Nas. Metamorphoseos lib. tertius* (copy in the Cambridge Library) with his name in the ordinary way. A *fourth* time it is on the title-page of *Seneca de quattuor virtutibus*, *c.* 1495 (also in the Cambridge Library), with the name "Seneca" in the scroll. Sotheby shows that it occurs a fifth time on the title-page of a *Donatus* published by J. de Breda, again with his name in the scroll. A sixth time (says Sotheby) the engraving occurs on the title-page of a tract *Dominus que Pars*, again with his name in the scroll. And finally (says Sotheby) it is on the title-page of *Secunda Pars Doctrinalis Alexandri*, with the date 1511 and the name "Joãnes Bergis" in the scroll. Seeing then the use made of this imitation till 1511, Sotheby, not unreasonably, suggests that the original scroll in the *Speculum* was from the beginning meant to contain the name of the printer (the inventor of printing). See also Dibdin, *Bibliographical Decameron*, ii. 285–296. One thing seems certain, the scrolls in the *Speculum* were not intended to be black in all cases, but to contain something or other, and not always the words *Mene*, &c., as in that case it would have been as easy for the engraver to cut them on the block as any other words or figures, pillars, &c. The printer probably wished to leave the choice to his purchasers. Incidentally the use made by Jacobus de Breda of his scroll points to his having been aware of the use for which the original scroll, which he imitated, was intended; and as the printer of the *Speculum* was undoubtedly the first printer of Holland, it is not improbable that Jacobus learnt his craft from him.

The above descriptions and explanations, based on bibliographical and typographical *facts*, deal exclusively with the editions and issues of editions of the *Speculum* now known to us. They by themselves make it clear (1) that their printer began as a *xylographer* and *block-printer*; (2) that the *six* editions which he published of this one work cannot be placed later than 1471, as this date is written in a copy of the latest of them; (3) that, for the printing of his *five* type-printed editions (Dutch and Latin), he manufactured no less than *three* different types.

When round these editions and types we now group the various other incunabula which must be ascribed to him, as being printed with the same types or others related to them by a striking family likeness and other circumstances, we obtain the following sequence for this printer's work.

A.—*The Xylographic Period.*

1. One or two folio editions of the *Speculum* in Latin, printed (pictures and text) from wooden blocks, and consisting most likely of 32 if not more chapters, but of which only ten sheets (twenty leaves), and six separate woodcuts (cut up into twelve halves, for the Veldener 4to edition of 1483) have come down to us. Of one of these xylographic editions, at least of ten sheets of it, three issues are known to have been made in combination with type-printed leaves (see below).

2. As various circumstances compel us to regard the printer of the *Speculum* as having been a xylographer before he invented printing with movable types, it is necessary to mention here a small block of wood which is known to have been preserved for nearly 300 years at Haarlem as a remnant of Coster's printing-office. On it is engraved part of an Horarium; its first lines beginning with *Servu*[*m*] *tuum in pace Quia viderunt oculi mei Salutare*, &c., of the hymn of Simeon. About 1628 it was in the possession of Adriaen Rooman, printer to the Haarlem Corporation, who had obtained it from one of Coster's descendants, a man of great age. Rooman gave it to Dr Johan Vlasveld, of Haarlem, at whose death, in 1684, it came into the hands of his children; in 1734 it was bought by Jan Maas of Haarlem, who left it at his death to his son-in-law the Rev. Jacobus Mandt, a pastor at Gorinchem; at whose death it was bought by Jacobus Koning, the well known author on the invention of printing, and after his death it was acquired by the Haarlem Town Library where it now is (see A. de Vries, *de Uitvinding der Boekdrukkunst*, 1862, p. 35).

B.—*Printing with movable Metal Types.*

Type I., also called the *Abecedarium* type, with which were printed: (1) The *Abecedarium*, 4 leaves, 16mo, on *vellum*, now preserved at Haarlem (Town Library), where M. Joh. Enschedé discovered it in 1751, in a MS. *Breviarium* of the 15th century; (2) An edition of *Donatus*, 31 lines, 4to, two *vellum* leaves, printed on one side, discovered in 1844, in the ancient binding of a Dutch Book of Hours, printed at Delft in 1484; it is now preserved in the Hague Royal Library.

Type II. (*Speculum* type 1; see p. 525; hitherto erroneously regarded as identical with *Speculum* type 3): (1) *First Dutch* edition of the *Speculum*, of 31 paper sheets (62 leaves) printed on one side, folio, hitherto known as the first or *unmixed* Dutch edition. Two issues: (*a*), printed entirely in this type, represented by copies at Lille and Haarlem (No. 4); (*b*), having some of its leaves replaced by leaves of the *third* Dutch edition, represented by the Pembroke and Haarlem (No. 5) copies. (2)[1] An edition of *Donatus*, 28 lines, 4to; two vellum leaves in the Haarlem Town Library, found pasted in the original binding of an account book of 1474 of the cathedral of that town, in which an entry testifies that this account-book was bound by Cornelis the bookbinder, whom Junius asserts to have been the servant of Lourens Janszoon Coster (Meerman, *Orig. typ.* Tab. VI.*). (3) Another *Donatus* of 28 lines, two leaves of which are in the Haarlem Town Library, and were discovered in the original bindings of account-books of the Haarlem Cathedral Church of 1476, also bound by "Cornelis the bookbinder." Fragments of this same edition are also in the Paris National Library, and in various other public and private collections. (4) *Donatus*, 28 lines, 4to, one vellum leaf, in the Hague Royal Library (BRH. 2; Ca. 612; Holtrop, *Mon.* pl. 13), discovered in the binding of a book belonging formerly to the Sion Convent at Cologne containing several treatises printed by Ulrich Zell, one being dated 1467. (5) *Donatus*, 30 lines, 4to. Two unrubricated *vellum* leaves in the Cambridge University Library (Inc. 4. E. 1.1), discovered in the binding of a copy of J. Mile's *Reportorium*, Louvain, 1475, now also in the same library. The first leaf contains the chapters xiv. 11 to xvi. 4, the second chapter xxvi. 6 to xxix. 10. The text is abridged, having *amabamus, batis, bant*, &c., where other editions have *amabamus, amabatis, amabant*, &c. (6) *Donatus*, 30 lines, abridged edition, 4to, one unrubricated vellum leaf, cut into halves. Wrongly described by Holtrop (BRH5) and Campbell (614) as part of No. 7 (below). (7) *Donatus*, 30 lines, 4to; two rubricated vellum leaves, in the Paris National Library (Van Praet, Velins, No. 8; now 1040). (8) *Donatus*, 30 uneven lines, 4to. Two rubricated vellum leaves, in the Hague Royal Library (BRH 5; Ca. 614). (9) *Donatus*, 30 lines 4to. Two vellum leaves in the Haarlem Town Library, discovered in 1750 by M. Joh. Enschedé at Haarlem in the binding of a MS. (*Handvesten . . . van Kennemerland*, 1330 to 1477). (10) A liturgical book, containing rules for saying Mass, in 16mo (12 lines to a page [Holtrop, *Mon.* pl. 14] 2 vellum leaves, pp. 3–6), in the Brussels Royal Library. (11) Alex. Galli *Doctrinale*, on vellum, 32 lines,

[1] The present writer is certain that *Speculum* type 1 differs from *Speculum* type 3 in size, and somewhat in form too. But he is still uncertain whether the *Donatuses* (2 to 7) here enumerated are in the same type as the first Dutch *Speculum*, though he travelled twice to the places where they are preserved to examine them. It would seem that the *Donatuses* are in a different type, more compact, regular and better cast than that used for this edition of the *Speculum*. But if there is any difference between the types it is so minute that it is well nigh impossible to detect it.

4to; one leaf and fragment of a second, in the Ghent University Library (Res. 1409). (12) Alex. Galli *Doctrinale*, on vellum, 32 lines, 4to. Two leaves (forming one sheet) in the Cologne Town Library.[1]

Type III. (*Speculum* type 2): (1) *Second Dutch* edition of the *Speculum*, which probably consisted of 31 paper sheets (62 leaves) printed on one side in folio, like the first and third. Only known from one sheet (leaves 49 and 60) which forms part of all the copies of the *mixed* or *third* Dutch edition preserved to us. (2) On account of differences in the setting up of the second column of leaf 60, another edition in this type may be supposed to have existed. There is no further trace of this type,[2] which greatly resembles type IV.

Type IV., also called the *Valla* type: (1) Laur. Vallae *Facetiae morales et Franc. Petrarcha de salibus virorum illustrium ac faceciis tractatus*, 24 paper leaves, small 4to. No other books printed in this type[2] are known to exist. But four of its capitals (B, H, L, and M) have been used in printing the edition of the *Singularia* of Ludovicus (Pontanus) de Roma, which otherwise is entirely printed in type VI.

Type V. (*Speculum* type 3, hitherto wrongly called *The Speculum* type): (1) The [*second* or *third*, but] *first type-printed Latin* edition of the *Speculum*, for which only 22 paper sheets (44 leaves) seem to have been printed to replace the same sheets of the earlier *xylographic* edition A, and to make up, in combination with the ten remaining xylographic leaves, a folio Latin edition of 64 anopisthographic leaves, called, on account of this mixture of xylography and typography, the *mixed* Latin edition. Some copies (the Berlin and Pembroke) of this mixed edition were still further mixed with sheets of the *second* type-printed Latin edition. (2) *Third Dutch* edition of the *Speculum*, hitherto known as the *mixed* Dutch edition, as having two leaves, (49 and 60) printed in a different type (*Speculum* type 2); 31 paper sheets (62 leaves) printed on one side, folio. (3) A Dutch version of the *Seven Penitential Psalms*, one *vellum* sheet (= 2 leaves), 4 pages 16mo, 11 lines to the page, printed on one side; copies in the Royal Library of Brussels (where it was discovered) and the Hague. (4) An edition of *Donatus*, of 27 lines, fragments of which are in the British Museum and the Bodleian Library. (5, 6, 7) Three editions of *Donatus*, of 30 lines, all on *vellum* (Holtrop, *Mon.* pl 14b; Meerman, *Origg.* iv.). (8) A *French* translation of *Donatus*, on vellum, 29 or 30 lines to a page; four leaves, now in the Utrecht University Library, discovered by Dr Samuel Muller, the Archivist of Utrecht, in a Utrecht MS. Cartulary of the first half of the 16th century. (9, 10) Two different editions of Alexandri Galli *Doctrinale* on vellum, 32 lines to a page (Holtrop, *Mon.* pl. 15). (11) Catonis *Disticha*, imperfect copy of four vellum leaves, 8vo, 21 lines to a page (Holtrop, *Mon.* pl. 16) in the John Rylands Library (Spencer Collection). (12) The [*third* or *fourth*, but] *second* type-printed *Latin* edition of 32 sheets (64 leaves), printed entirely in this *Speculum* type (3), and therefore known as the *unmixed* Latin edition (Holtrop, *Mon.*, pl. 17). For the use of sheets of this edition to complete copies of the earlier edition, see above V.1. The Munich University Library copy has the rubricator's date 1471.

Type VI., also called the *Pontanus* type: (1) Ludov. (Pontani) de Roma *Singularia juris* (in type VI.) and Pii Secundi *Tractatus de mulieribus pravis et ejusdem Epitaphia* (in type VII.), 60 paper leaves, folio, of which the Pontanus occupies the leaves 1 (blank) to 45 recto, and the Pius, the leaves 45 verso to the end. Various differences are found in the copies of the Pontanus known to us, and we may assume two if not three issues. This type VI., therefore, is linked on to type VII. by the two being used in one and the same book, while it is inseparably connected with type IV. by the capitals B, H, L and M of this latter type being employed in printing the *Singularia*. Copies in the British Museum, Cambridge University Library, John Rylands Library (Spencer Collection), Hague Royal Library. (2, 3, 4, 5) Four different editions of *Donatus*, each of 24 lines, fragments of which are preserved in the Hague Royal Library, Haarlem Town Library, Paris National Library, Cologne Town Library, &c.

Type VII., also called the *Saliceto*, or the *Pii Secundi Tractatus* type. (1) *Pii Secundi Tractatus et Epitaphia*, mentioned above under type VI. as being printed with the *Pontanus* in one volume. (2) Guil. de Saliceto *De salute corporis*. Fragments of two *vellum* leaves of this edition, discovered in the binding of a copy of the *Formulae Noviciorum*, printed at Haarlem by Joh. Andreae, in 1486, are now in the British Museum. The fragments are printed on one side only, and their texts correspond to the leaves 3 and 5 of another edition (see below) in the same type, to which treatises of Turrecremata, Pius Secundus, &c. have been added. It is not clear why these fragments were printed on one side only; the *versos* have not been scraped as was asserted by Holtrop and Campbell, nor are they printer's waste, as they are rubricated. It is not known whether the treatises added to the other edition formed also part of this one. (3) An edition of *Donatus minor*, or *abbreviatus*, 26 lines. (4, 5, 6, 7, 8) Five different editions of *Donatus* of 27 lines. (9) An edition of the *Doctrinale*, of 26 lines. (10) A *Doctrinale* of 28 lines. (11) *Doctrinale* of 29 lines. (12) *Doctrinale* of 32 lines. (13) *Catonis disticha*, 21 lines. (14) [Incerti auctoris, vulgo Pindari Thebani] *Iliados Homericae Epitome abbreviatum* (metrice), cum praefatione Pii II. in laudem Homeri, in folio, 10 leaves (first blank), 35 lines; first edition having, on fol. 9a, as last line 35: "intēcio homeri in precedēti poemate est describere," as in the copy in the Cambridge University Library (Inc. 3 E. 1. 1). (15) Guil. de Saliceto *De salute corporis*; De Turrecremata *De salute corporis*; Pii II. *Tractatus de amore*; (Pindari) *Iliados Homericae epitome* abbreviatum, cum praefatione Pii II.; added are three additional pages, the first contains "Hectoris . . . Epitaphium"; the second "Homonee . . . Epitaph."; the third is blank. In folio, 24 leaves (first blank), divided into two quires of six sheets each; 34, 35 and 36 lines (second edition of the *Saliceto*, and of the *Yliada*; but *first* of the *Turrecremata*, and the *Tract. de amore* of Pius II.). This edition is represented by the copy in the Hague Museum Meerman, in which a MS. note records that it was bought between 1471 and 1474 (Campbell *Ann.* 1493), which still has in the *Yliada*: "in precedēti poemate est describere." (16) *Second* edition of the *Yliada*, having as last line (35) on folio 9a a more correct reading: "intēcio homeri in hoc opere est describere troianā." This edition is represented by the British Museum copy (pressm. 8814) and the three additional pages (3rd blank already found in No. 15) "Hectoris . . . Epitaphium" and "Homonee . . . Epitaph." (17) Another edition of No. 15 (that is *third* edition of the *Saliceto*, second of the *Turrecremata* and *Tract. de amore* of Pius II., *third* of the *Yliada* and *third* of the additional pages), but with the line in the *Yliada* (on 22a): "intēcio . . . troianā." This edition is represented by the British Museum copy (C. 14. b 10). (18) Another issue of the *Saliceto*; *Turrecremata*; Pii *Tract. de amore* et *epitaphia*, 26 leaves, with various additions or omissions and differences in the setting up not in the former editions. Copy in the Darmstadt Hof-Bibliothek (S 4705), which has the rubricator's date *1472* written in two places. (19) Another issue of the *Yliada* with the Pii *Tract. de amore et epitaphia*, again with additions, omissions and differences in the setting up, not in the Darmstadt copy or in the earlier editions. Represented by 17 loose leaves in the Museum Meerman at the Hague (see Holtrop, *Mon. typ.*, pp. 32, 33).

An *eighth* type, hitherto regarded as a Costerian, is type VI. in Hessels's List of Costeriana (*Haarlem not Mentz*, p. 31 seq.), where two editions of *Donatus* in this type are mentioned, one of 26 lines, four leaves of which are in the Catholic Gymnasium at Cologne (Campbell, 629), another of 27 lines, of which leaf 11 is in the Museum Meerman at the Hague, some fragments in the Haarlem Town Library and two leaves (formerly in the Weigel Collection) in the British Museum (IA 47028). Holtrop (*Mon. typ.* pl. 21) and Meerman (*Opp.* pl. II.) give a facsimile of the type. Campbell, in his *Annales* (No. 629, 631), referring to pl. 31 of Holtrop's *Mon.* for a facsimile of both these editions, says that they are printed with the types of the Pii II. Tractatus (the *Saliceto* type), but that, by the size and form of the P, this edition is distinguished from the other books in this type. Hessels (*l. c.* p. 24) repeated this; but Campbell's assertion proves to be an error, as the two types differ, in spite of a great likeness between them (the C, F, I and V being almost identical). That of the two *Donatuses* is an early Gothic, and has some of the characteristics of the Costerian types, as the *t* with perpendicular stroke to its cross-bar, the marks of contraction connected with the letters above which they appear, but only a few pairs of letters cast on one body, and no *r* with a curl; so that it seems somewhat later than those mentioned above.

A *ninth* type (facsimile in Holtrop's *Mon.* pl. 32a), hitherto regarded as a Costerian, is No. VII. in Hessels's List (*l.c.*). It resembles much that of the *Saliceto*, and has served for a *Donatus* of 27 lines, fragments of which representing two copies, were found in the binding of a Durandi *Rationale*, printed at Strassburg, 1493, belonging to the Convent of the Holy Cross, at Uden in North Brabant. This type again bears a great likeness to the *Saliceto* and also to the above type 8, but it differs from both.

Setting aside for the moment the types viii. and ix. as doubtful Costerians, we must also point out that there is no direct evidence that type i. is connected with the other seven, or that it is the first of them. But it is a primitive one; it has all the characteristics of the *Speculum* and other Costerian types, and could hardly be placed later than the earliest of them; the *Donatus* printed with it is printed on one side of the leaf only; it shows, moreover, in other respects that it must be dated before 1470. The *Abecedarium* printed with the same type, and discovered at Haarlem in a 15th century manuscript belonging to a Haarlem family, looks as the work of an inexperienced printer. The types II., III. and V. (the *Speculum* types 1, 2 and 3) are inseparably connected with each other; they

[1] It may be that some of the works enumerated under type v. are really printed in the first *Speculum* type, but it is almost impossible to come to some certainty as to the difference between types 1 and 3, unless the books are together.

[2] The present writer has recently purchased from Herr Jaques Rosenthal, of Munich, two leaves of a *Donatus*, which were said (in Herr Rosenthal's catalogue) to be printed in the *Valla* type (IV.). On examination this proves not to be the case. At first sight it seemed to him to be type III (*Speculum* type 2). But this is not the case either. It has, however, the peculiarities of both these types combined, so that he does not hesitate to call these fragments a *unicum*, and its type provisionally type III.*

must have been in one and the same office; their workmanship shows that their founder step by step simplified and improved his work, and in what order they are to be placed; the most perfect of them (V.) was in existence not later than 1471 (see above), and the three, together with the xylographic leaves in the mixed Latin *Speculum* (from which they cannot be separated) take us back to a period which could not possibly be extended beyond 1470, but which may reasonably be said to have begun as early as, say 1440.

Therefore these three types, and the books printed with them in combination with the xylographic leaves, and various circumstances pointing to Haarlem as their birthplace, would alone suffice to support and vindicate the Haarlem claims to the honour of the invention of printing. It could, however, serve no useful purpose to separate the types I., IV., VI. and VII. from those of the *Speculum*, as they have all a great family likeness and three distinctive peculiarities common among them: (1) a perpendicular stroke to the cross-bar of the *t*; (2) a small curl attached to the top of the *r* found in no other Netherlandish type; it goes backward in types 1 and 3; and in type 2 another curl is added to the first, bending to the right again; (3) a minute perpendicular link connecting the marks of contraction with the letters above which they appear (a peculiarity common also in the Dutch MSS. of the time). A copy of the latest issue of the *Saliceto*, preserved at Darmstadt, printed in type VII., has the rubricator's date 1472 in two places; another book in the same type (in the Meerman Museum) was bought between 1471–1474, and as this type is used for a tract printed together with the Pontanus treatise printed in type VI., and the Pontanus type is supplemented with capitals of type IV. (the *Valla* type), it follows that these three types (IV., VI. and VII.) must have been in use in one and the same office, and that the latest of them (VII.) cannot be placed later than 1472. Again, it must be said that there is no direct evidence that these three types were used by the printer of the *Speculum*, but as fragments of *Donatuses* in the Saliceto type have been found in account-books of the Great Church at Haarlem, all presumably bound by the same Cornelis the bookbinder (the reputed servant of the Haarlem inventor), who also used fragments of *Donatuses* in the *Speculum* types, Haarlem may be regarded as their common birthplace.[1] Hence these seven types may be grouped thus: (*a*) the *Abecedarium* type; (*b*) the three *Speculum* types; (*c*) the *Valla*, *Pontanus* and *Saliceto* or *Pius* types; the (*a*) group cannot be dated later than 1470; (*b*) (three types) not later than 1471; (*c*) (three types) not later than 1472 and perhaps not before 1458.

Here then we have a printer who, before 1472, had manufactured and extensively used at least seven (if not eight or nine) different and primitive looking types; three of the seven must have existed long before 1471, as with them he had printed before that year no less than five folio editions of one book (the *Speculum*), besides several editions of *Donatus* and the *Doctrinale* of Alex. Gallus and other smaller books. This work may be supposed to have extended over a number of years, and before he printed any of these type-printed books he had already engraved, printed and issued at least one large folio blockbook (the *Speculum*).

And yet the catalogues of the present day, which profess to arrange the incunabula *chronologically*, under their respective countries, towns, printers, types and dates—according to some "historical" or "natural history method" suggested in 1870 by an eminent bibliographer, and intended to show the "development of printing"—assign this primitive Dutch printer, and his primitive types and books, to what is presumed to be their "chronological" place, *after* the productions of Germany, Italy, Switzerland and France; that is, they are placed in a period when printing presses had been established in nearly every large town of Europe, and the art of printing was already so fully developed and vulgarized, that the books of that period show, on comparison with the Costeriana, that the latter must have preceded them by at least two or three decades.

Apart from this anachronism, the same catalogues assign this printer and his books no longer to Haarlem in North Holland, to which they had always been attributed in conformity with the tradition that printing had been invented in that town and the *Speculum* and other books printed there; but they locate them at Utrecht, the capital of the province of the same name, although the types of the Costeriana show that they are imitations of the handwritings indigenous to the province of Holland, not to those of Utrecht.

[1] The Cambridge University Library possesses two sheets of two different editions of *Donatus*, one (unrubricated) printed in *Speculum* type 1, the other (rubricated) in the *Saliceto* type, both found pasted by the binder on the wooden boards of a copy of J. Mile's *Repertorium*, printed at Louvain in 1475, which is also in the same library.

This bibliographical calamity dates from the year 1870, when Dr Anton Van der Linde published his book *The Haarlem Coster Legend*. After it had become known to him that for years past the "Lourens Janszoon Coster" mentioned by Junius as the inventor of printing had been confused by some authors with another inhabitant of Haarlem, whose name was "Lourens Janszoon," but who had never borne the surname "Coster," he, after an inadequate investigation in the Haarlem archives and elsewhere, professed to prove from documents (1) that the Haarlem tradition was nothing but a "legend," the kernel of which was "Jacob Bellaert," who published in 1483 the first Haarlem book with a date; (2) Lourens Janszoon Coster was a "myth"; (3) Cornelis the bookbinder, Junius's chief witness for the Haarlem tradition, had been Bellaert's servant, and, telling his story in his second childhood, magnified the first Haarlem printer of 1483 into the first printer of the world; (4) the "Spiegel" and the Donatuses could not have been printed before 1470–1474, &c. As Van der Linde's book was apparently based on documents, it was generally thought to have put an end to the Haarlem claims. It seems to have struck nobody at the time that this Haarlem tradition or legend, if it had originated in or after 1483, could not have been so strangely distorted and altered that, within a few decades, "Jacob Bellaert" its hero, according to Van der Linde, was forgotten, while his "servant," in his second childhood, substituted for him another person of an entirely different name and of a much earlier period; whose descendants all appear in Haarlem's history, and one of whom records him in a genealogy; who is himself mentioned again and again in the Haarlem registers of the time, but who is finally, in 1870, declared to be a "myth." Nor did it strike anybody at the time that if Cornelis the bookbinder had been Bellaert's servant or binder, and his story of the inventor related to him, and to no other printer, this bookbinder must have used fragments of Bellaert's productions for strengthening his bindings, instead of which he employed fragments of the Costeriana, which are admittedly not printed by Bellaert.

These are two of the many points which might have arrested Van der Linde in his sweeping denunciation of the Haarlem tradition if he had given more attention to the subject. As no reply invalidating the main part of his criticism emanated from Haarlem, Henry Bradshaw, the librarian at Cambridge, who had been studying the Dutch incunabula for some years, accepted Van der Linde's conclusions, and published, in 1871, his *List of the founts of type used by printers in Holland in the 15th century*, in which he explained that he was compelled to place the printer of the *Speculum* at Utrecht because "it is there that the cuts of the old folio editions first appear cut up into pieces in a book (*Epistelen ende Evangelien*) printed by Veldener at that place in 1481. Without further information he would have found it necessary to place the printer of the *Speculum* last among the Utrecht presses and to affix as his date (before 1481). But as the types of the *Yliada* (VII.) and of the Ludovicus de Roma (VI.) bear a close resemblance to those of the *Speculum*, they could not be separated from the latter, and a note in the Hague copy of the *Tractatus de salute corporis* in the same type VII. makes it clear that it was bought between 1471 and 1474, this was the only date which he could accept, and it compelled him to place the printer of the *Speculum* at the head of the Dutch printers, just as the *Speculum* compelled him to place him at Utrecht."

It is clear that Bradshaw's system of classifying the incunabula, so inflexible as regards dates and places of printing, that he would admit any stray statement on these points if it be found in the books themselves, rather than go outside the books for further information, is yet elastic enough to ascribe the *Yliada* and the *Pontanus* to the printer of the *Speculum*, merely on account of a close resemblance between the types of these books. As he knew that the early printers shaped their types according to the handwritings indigenous to the places where they settled, it must have escaped him that in locating the printer of the *Speculum* at Utrecht, he placed him among printers whose types bore no resemblance to those of the Costeriana. This system, therefore, so rigorous on the one hand and so flexible on the other, can only be applied with safety to books whose country, printer and date are known, not to such as the *Costeriana*, which have neither date nor printer's name, nor place of printing, and might, therefore, be ascribed to France, Italy, Germany or any other European country, if it were not that some of them were printed in the Dutch vernacular.

As to the *Speculum* cuts being in Veldener's hands in 1481 (and 1483), various circumstances show (see Holtrop, *Mon.* p. 110 sqq.) that he could not have possessed them, nor acquired them from other printers at Utrecht, until he used them cut up into halves and already considerably worn out. It is also known that ten years at least before he employed them, the cuts had been used intact as illustrations in a book which could not be ascribed to him. In such cases bibliography is bound to inquire where they could have been so used before ascribing them to the place where they are used in 1481. The statements of the *Cologne Chronicle* (1499) and of Junius (1568) when examined together with the types and workmanship of the *Costeriana* give satisfactory answers on this point. The fact that fragments of a French translation of *Donatus*, printed in *Speculum* type 3, and of a treatise of Ludov. Pontanus on Canonical Law in the *Pontanus* type, were discovered at Utrecht, cannot be set against the finding of many more fragments of Donatuses, &c. at Haarlem.

Bradshaw lived to see some result of his system in Campbell's *Annales*, published in 1874, where all the Costeriana are ascribed to a *Prototypographie neerlandaise à Utrecht*, and he regretted it. Unhappily, his untimely death prevented him from testing his system more closely; those who adopted it were unable, or considered it unnecessary, to repeat his explanations and reservations, so that the Costeriana are now, in almost every catalogue, placed at Utrecht,[1] without any sign of doubt or hesitation, though all the particulars connected with them prove that they could not have originated there.

To ascertain the probable date of the Haarlem invention, we have at our disposal: (A) some historic statements and documents, namely (*a*) two entries of 1446 and 1451 in the Diary of Jean Le Robert (Abbat of Cambray); (*b*) the Helmasperger Instrument of 1455; (*c*) Ulrich Zell's account of the invention of printing in the *Cologne Chronicle* of 1499; (*d*) the Coster pedigree; and (*e*) Junius's narrative of the Haarlem tradition; (B) a collection of nearly, if not more than, fifty incunabula, known as Costeriana, the printing of which must have involved the manufacture of *seven* types, four of which (the *Abecedarium*, and three *Speculum* types) cannot be placed later than 1471, the other three (the *Valla*, *Pontanus* and *Saliceto* types) not later than 1472. With these types were printed five folio editions of the *Speculum*, twenty-three of *Donatus*, eight of the *Doctrinale*, besides several other important books.

Date of Haarlem Invention.

A. Historic Statements.—Junius, saying that Coster invented printing in 1440, and that Johan, who stole his types, printed with them at Mainz in 1442, probably knew, or had heard, nothing more definite about a date than that Coster's types were used at Mainz within a year after the theft. The year 1440 as that of the invention was first mentioned, it seems, in 1483, in testimony xvii.; a second time by the *Cologne Chronicle* in 1499 (but only as the year in which the art began to be "investigated," whatever that may mean), and again in 1505 and later (testimonies xxix., xxxix.). Junius, therefore, may have derived 1440 not from the Haarlem tradition, nor from the Coster pedigree (which gives 1446, and may imply a still earlier date), but from other sources, and hence fixed the commencement of printing at Mainz in 1442 (first mentioned, it seems, in 1499 by Polyd. Vergil, testimony xxiii.). Be this as it may, the Helmasperger instrument of 1455, if it is genuine, shows that Gutenberg could not have begun printing before the end of 1450, if so early, as in that year, about the middle of August, he borrowed money for "making his tools," and was then, moreover, destitute of everything necessary for printing, as parchment, paper, even ink. This year 1450 agrees with the date (1451) written in the Paris *Donatus*, which, on insufficient grounds is considered to be a forgery. It also agrees with Ulr. Zell's statement in the *Cologne Chronicle* that printing and all that belonged to it were "investigated" from 1440 to 1450, and that in the latter year they began to print. And it likewise agrees with the testimonies xxviii., xxx., xxxi., xxxiii., xxxviii. and xl. quoted above, which all come from persons who may be supposed to have known something about the date of early Mainz printing, namely, Johan Schoeffer, the son of Peter Schoeffer, Joh. Trithemius (who was personally acquainted with both Peter and Johan Schoeffer), Joh. Thurmayer Aventinus (who lived from 1474 to 1534), Mariangelo Accorso (who wrote *c.* 1533), while No. xl. is that of Joh. Bergellanus, the first author, so far as we know, who mentioned the lawsuit of 1455, in his *Encomium*, printed and published in the very St Victor Stift of which Gutenberg had been for some years a lay-brother till his death, so that this testimony points to Gutenberg's own version of the "beginning" of Mainz printing.

Mainz date, 1450.

Therefore the Mainz date 1450, derived from documents and testimonies which cannot be lightly set aside, is much later than the latest date (1446) of the Haarlem claims, and those who accept the Haarlem tradition, as we do, may reasonably conclude that Fust was induced to advance money to Gutenberg about August 1450, not by seeing anything printed by the latter, but by having some of Coster's types and tools, and a type-printed *Donatus*, shown and explained to him.

We are, however, now asked to disregard this date 1450 and all documents that indicate, and have hitherto always been relied on as fixing, the beginning of printing at Mainz in that year, and to believe that the *Astronomical Kalendar*, said to be for 1448, was printed at Mainz in 1447. If this year could be accepted for the printing of this Kalendar, its value would of course be greater than any written or printed statement. It is, however, far from certain, and its assumed date, though not interfering with the Haarlem dates, as it falls after 1446 of the Coster pedigree, is incompatible with the Helmasperger instrument, which shows that so late as August 1450 Gutenberg had not printed anything, and had not even made his apparatus for printing. There remains the Poem on the "Weltgericht," also ascribed to Gutenberg and said to be printed in the same type as the *Donatus* of 1451, with the exception of certain letters the form of which represents, it is thought, a still earlier stage. Hence the Poem is dated back, apparently for no tangible reason, to 1443–1444, and the *Donatus* placed between it and the *Kalendar*, the type of which is said to be a "development" of the *Donatus* type. This date, which is even more speculative than that assigned to the *Kalendar*, militates entirely against the Helmasperger instrument; it can hardly be said to go against the Coster pedigree, while it does not interfere with, but rather favours, Junius' dates.

Among the historic statements also come the two entries of the Abbot of Cambray, on folio 161ᵃ of his *Diary*, preserved in the Archives at Lille, in which he records having bought in January (1445, o.s. =) 1446 and in 1451, at Bruges and Valenciennes, printed[2] *Doctrinalia* (on vellum[3] and on paper). Even if printing could be said to have begun at Mainz in 1450 or earlier, no *Doctrinalia* printed there have ever come to light, unless we accept the Haarlem tradition, that those printed with Coster's types were printed there. Hence these entries can only be applied to the *Doctrinalia* printed in Holland in the same types as the *Speculum* (on which Junius based the tradition of the Haarlem invention) and the *Donatuses* which fit into Zell's historic statement (in the *Cologne Chronicle* of 1499), that the *Donatuses* printed in Holland were the models for the Mainz printing. Therefore there is no certainty as to any Mainz printing having been done before 1450, and, if the Helmasperger instrument has any value, it is certain that it could not have begun there before that year; Ulrich Zell unreservedly places the printing done in Holland before that of Mainz; Jean Le Robert's statements make it certain that printing was exercised before January 1446; the Coster pedigree fixes no later date than 1446 for the invention at Haarlem; Junius' years (1440–1442) are, perhaps, his own guess. Anyhow, if historic statements and documents have any value, the invention must have been accomplished within the six years from 1440 to 1446 (also indicated by Zell).

B. *The Costeriana.*—It has been pointed out above that we have nearly 50 Costeriana, for which *seven* types have been employed, four of which cannot be placed later than 1471, the remaining three not later than 1472; and that with these types five folio editions of the *Speculum* were printed, 23 of *Donatus*, 8 of the *Doctrinale*, besides several other important books. With such an abundance of material, for the greatest part of which we have the year 1471–1472 as an undoubted *terminus ad quem*, we need not inquire too anxiously whether Junius placed the invention in 1440, or whether the Haarlem Coster pedigree fixes it at 1446 or earlier. For, by placing intervals either between the seven types or between the several editions of the *Speculum*, *Donatus*, *Doctrinale*, &c., we can easily reach any *terminus a quo* which may be found to agree with the historic statements explained above. Such intervals, however natural and necessary they may be to arrange the Costeriana in some chronological order, must always be more or less arbitrary, as it is impossible to say whether the editions followed each other within two months or within two or more years, or whether the types became used up within six months or within six, seven or more years. Therefore, only such intervals need be suggested as may show that the Costeriana, or some of them, may reasonably be placed before Mainz dates which are certain (that is *c.* 1450, derived from the Helmasperger instrument, and 1454, the date of the Indulgences), or speculative (as 1443–1444 for the "Weltgericht," and 1447 for the *Astronomical Kalendar*). The first products of the art of printing were intended to be faithful imitations of the manuscripts, and no material deviations from the general plan become observable till about 1473–1477. Nowhere are the features of the MSS. of the 15th century so faithfully imitated as in the productions of the three earliest printing-offices of Coster, Gutenberg (?) and Schoeffer. They are all without

[1] It is pleasant to be able to record some exceptions. Voulliéme and Günther in their *Catalogues* still mention Haarlem.

[2] The abbot speaks of *Doctrinalia* "gette" or "jettez en molle," and the phrase is, as Bernard (*Origine*, i. 97 seq.) shows by eight examples from 1474 (the year when printing is first officially spoken of in France) to 1593, and down to the present day, applied to typographically printed books only; see also Fred. Godefroy, *Dictionaire*, in voce *mole* (which he interprets as *caractère d'imprimerie*, where he gives six quotations showing the same meaning.

[3] The abbot does not mention the word *vellum*, but states that the *Doctrinale* which he had bought at Valenciennes was full of mistakes wherefore he had bought one *on paper*.

signatures, without printed initial directors,[1] without printed catchwords; in short, without any of those characteristics which we see gradually, one after the other, come into almost general use when printing becomes more developed, that is from 1473 (if not earlier) to 1480. Hence a comparison of the *Speculum*, *Donatus* and *Doctrinale* editions, printed in the *Speculum* and other types, with the Gutenberg and Schoeffer *Donatuses* and their other books enumerated above, shows that the types, mode of printing and workmanship of all these books stand on nearly the same primitive stage. Yet there is a considerable difference between the productions of the three offices, those of the Haarlem office being more primitive than any of the other two. First of all the types of the Costeriana (which have nothing in common with any of those used in the Netherlands after 1471), show by their *t* with the perpendicular stroke attached to its cross-bar, the *r* with a curl, and the signs of contraction connected by a fine link to the tops of the letters over which they stand, that they were manufactured during the MS. and block-printing periods of Holland. Secondly, none of the Costeriana have any hyphens, which, in the Gutenberg and Schoeffer incunabula appear already from the beginning. Thirdly, the five editions of the *Speculum* are all printed anopisthographically (that is, on one side), the woodcuts at the top of the pages as well as the explanatory text underneath, which would hardly be the case if they had been printed after 1471, when the printing of woodcuts, together with text in movable types, on both sides of the leaf, was no longer a novelty. None of them have any colophon (except such a word as *explicit*), which would, for a collection of nearly 50 books, be incompatible with a period after 1471, but not with the earlier period of the blockbooks and MSS. Moreover, of the 50 no less than 38 are printed on vellum, which is incompatible with a period after 1471 and even earlier, when printing on paper had become universal, but not with the earlier period of the MSS. Therefore, those who wish to date the *Donatuses*, ascribed to Gutenberg, before 1450, or before 1447, must not forget that the more primitive editions of the *Speculum*, *Donatus* and *Doctrinale* printed in types I. and II. &c. can also be dated before 1450 or 1447; and when once so much is admitted, there is no reason to reject Zell's statement that the *Donatuses* printed in Holland served as models to Mainz printing.

In addition to the above considerations, there is the remarkable fact that the chief productions of the three earliest printing-offices are editions of *Donatus*, all printed on vellum. This fact has become more conspicuous by the discovery in recent years, in various parts of Holland and Germany, of a multitude of fragments of different editions of this schoolbook. Of the Haarlem office we know 23 editions; 13 are ascribed to Gutenberg; 9 we have in the Schoeffer or B^{42} type. The production of so many editions, all about the same time in the infancy of printing and in two different places, so widely apart from each other as Haarlem and Mainz, cannot have been an accident or coincidence, but suggests some connexion, some links[2] between the three or more offices that produced them. One link we find in Ulrich Zell's statement that the *Donatuses* printed in Holland were the models for Mainz printing, another in the Haarlem tradition, as narrated by Junius, that one of Coster's workmen, taking his master's types and tools, went with them to Mainz and settled there as a printer. These two statements go far to explain not only how the art of printing was transferred from Haarlem to Mainz, but how, at the latter place, it was thought expedient to continue the printing of *Donatuses* begun at Haarlem. Bearing this obvious connexion between the three earliest offices in mind, and also that the books of the printer of the *Speculum* show that he could not have learnt his art at Mainz or any other place, the only question really is: Can the Costeriana, or some of them, by placing an interval between them, be dated so far back that they may be placed before the certain or speculative dates now attributed to books or broadsides printed at, or ascribed to Mainz. In our former edition, when only 20 Costerian editions of *Donatus* were known, and no earlier final date than 1474, we suggested an interval of 18 months between each of them, giving about 30 years, from 1474 back to 1445, for the issue of all the *Donatuses*. We now know 23 editions, and 1472 as final date for the existence of all the types, though, of course, some of the editions may have appeared after this year. Therefore, our interval need not be longer than about 15 months, which makes a stretch of nearly 29 years from 1472 back to 1443. As to an interval between the types, an eminent type-founder, Dr Ch. Enschedé of Haarlem, when dealing with Coster's types (in his treatise *Laurens Jansz. Coster de uitvinder van de boekdrukkunst*, Haarlem, 1904, p. 28), reminds us of three printers (Eckert van Homberch of Delft, Govaert Bac and Willem Vorsterman, of Antwerp), who used one type all the time that they were printing (which means 23 years for the first and 19 for the second), and declares that we could not possibly put a shorter interval than 6 years between each type. As there are seven Costerian types, such an interval would mean a period of 42 years, from 1472 back to 1430, hence only four and a half years ($=31\frac{1}{2}$ years) between each type would suffice to reach the year 1440.

These calculations, however, include the *Abecedarium* (i.), *Valla* (v.), *Pontanus* (vi.) and *Saliceto* (vii.) types, and, as has been pointed out above there is no absolute proof that these four also belonged to the printer of the *Speculum*. Types v., vi., and vii. cannot be separated, and two circumstances, mentioned above, make it more than probable that they did belong to him. But the *Abecedarium* type can be ascribed to the *Speculum* printer on no other grounds than that it has all the characteristics of the Costerian types; that it is too primitive to be attributed to any later Dutch printer, so far as we know them, and that the *Abecedarium* printed with it, was discovered at Haarlem in a Dutch MS. which belonged to a Haarlem family.

Hence a computation based on the five *Speculum* editions (all printed and issued at least before 1471), the 12 editions of *Donatus* and four editions of the *Doctrinale* printed in the same types might be more convincing to the opponents of Haarlem's claims. Apart from the final date (1471) for them there is also evidence that the *Speculum* type I existed a considerable time before 1474, as in that year the bookbinder Cornelis used fragments of a *Donatus* printed in that type in the binding of an account book of the cathedral church at Haarlem. Their types and workmanship, moreover, compel us to place them before the *Valla*, *Pontanus* and *Saliceto* (or *Pius*) types. The last two, employed together in one book, cannot have been used for this book before 1458, as it bears the name of Pope Pius II., who was not elected till that year, but it is certain that it cannot have been printed after 1472. The *Valla* type, however, existed before the *Pontanus* and *Saliceto* types, as four capitals of the former were used to supply the want of such capitals in the *Pontanus* type.

If then, as suggested by Enschedé, the type-founder, an interval of six years is placed between the three *Speculum* types, it would mean 18 years, or a period from 1471 back to 1453. A similar number of years we obtain by intervals of 18 months between each of the 12 editions of *Donatus* printed in type I. Even this moderate calculation makes it plain that the printer of the *Speculum* must have begun printing at least about the same time that printing began at Mainz. But we have seen above that this printer did not hesitate to make up complete copies of his books by mixing sheets of a later edition, printed in a different type, with those of an earlier edition, and even mixed type-printed with xylographically printed sheets. A printer so carefully and economically husbanding his stock of sheets is not likely to have printed new editions of his books before the old ones were fully sold off, or to have manufactured new types till his old ones were used up. Moreover, Haarlem, a quiet provincial town, could not have been a favourable market for a rapid sale of books, especially not for books in the vernacular, like the Dutch versions of the *Speculum*. Hence we should not put too short an interval either between his editions or his types.

As (*e.g.*) Gerard Leeu[3] printed at Gouda, during the six years 1477 to 1482, 17, mostly bulky, volumes, together consisting of 2968 leaves, or nearly 6000 folio pages, all in *one* type, we need not hesitate to place at least eight or nine years between each of the three *Speculum* types, that is together 24 or 27 years from 1471 back to 1447 or 1444. It is true, the types manufactured after, say 1477, may have been more enduring than the earlier types, as being, perhaps, cast of better material and by a more perfect process than those of Coster, but the number of pages printed by the latter with the three *Speculum* types, barely amounts, so far as we know, to a tenth part (600 pages) of Gerard Leeu's work. Our calculations are, of course, liable to modification or alteration; earlier dates may yet be discovered in the Costeriana or in other documents; more editions of *Donatus* in the same types may be found, which would shorten the intervals. But we have shown that, without straining chronology, bibliography or typology, the Costeriana can be dated back so as to harmonize with any historical date, Dutch (1440, 1446) or German (1450), known at the present time, or so as to precede even the speculative dates (1447 or 1444) assigned to some Gutenberg products.

Necessity of an Earlier Printer before Mainz.

There is therefore no reason to discredit Zell's statement in the *Cologne Chronicle* of 1499, that the *Donatuses* printed in Holland were anterior to, and the models for, the art of printing at Mainz, or that of Hadrianus Junius in his *Batavia*, that printing was invented at Haarlem by Lourens Janszoon Coster, and that the *Speculum* was one of his first productions. The two statements were made independently of each other. But even without

[1] An exception is to be noticed in the Costerian *Yliada* (see above type VII., no. 14–17) in which on the recto of the second leaf the initial director *i* is printed.

[2] Schwenke has, to some extent, observed this connexion, and suggested that the texts of the *Donatuses* should be studied, as the differences between them might show whether those of Mainz were printed from the Haarlem editions or vice versa. Such a study may be useful, but could hardly lead to a definite result, as the types of these schoolbooks, like those of other incunabula, were imitations of the respective handwritings of the places where they were printed, and the texts were no doubt taken from the same MSS. in the first instance, though it is possible that the types were cast for other books and used afterwards for the *Donatuses*.

[3] These examples might easily be multiplied. Ulr. Zell, for instance, printed more than 80 books in his first type.

them, the existence of a group of nearly fifty primitively printed books of undoubtedly Dutch origin, the printing of which must have taken a number of years before 1471, would suggest serious doubts as to the priority of Mainz printing. Zell's statement is all the more weighty, as it is not one made at random but meant to be a direct *contradiction* of the vague rumours and statements about an invention of printing at Mainz by Gutenberg, which had gradually crept into print since 1468 in Italy and France, and had found their way back into Germany about 1476, after Mainz and Germany had given the greatest publicity, during twenty-two years, to the existence of the new art in their midst; while all those who might, and would and could, have told the public that the invention had been made at Mainz, if it had come about there, preserved a profound silence on this particular point, even the supposed inventor himself. And, though Zell accords to Mainz and Gutenberg the honour of having "improved" the art and having made it more artistic, he denies to them the honour of having "invented" or "begun" it, and this latter honour was never claimed by that town before 1476. Junius's account, on the other hand, is the embodiment of a local tradition at Haarlem, the first written traces of which we have in a pedigree (testimony xxxiv) of the family of the reputed Haarlem inventor, which, as regards its central part, may have existed at least as early as 1520, whereas its first part may be dated much earlier. His account is indirectly confirmed by the finding of several fragments at Haarlem, all belonging to the groups of books mentioned above, but still more by the discovery of several fragments of the *Donatuses* printed in the *Speculum* type 1 and 3, some of which had been used as binder's waste by Cornelis, the bookbinder, the very man whom Junius alleges to have been the servant of Coster.

As the case stands at present, therefore, we have, after careful and impartial examination, no choice but to repeat that the invention of printing with movable metal types took place at Haarlem between the years 1440 and 1446 by Lourens Janszoon Coster.

That the Haarlem inventor of printing was, as we have shown, a block-printer before he printed with movable types, helps us to understand what the tradition, as chronicled by Junius, says of him (Testimony xliv. *b*): that he, while walking in the wood near Haarlem, cut some letters in the bark of a tree, and with them, reversely impressed one by one on paper, he composed one or two lines as an example for the children of his son-in-law. Junius does not say it, but clearly implies that, in this way, Coster came to the idea of the movability (the first step in the invention of typography) of the characters which, hitherto, he had been cutting together on one block. He perceived the advantage and utility of such insulated characters, and so the invention of printing with movable types was made. The questions as to whether he continued to print with movable "wooden" types, or even printed books with them, cannot be answered, because no such books or fragments of them have come down to us. Junius's words (Test. xliv. § *d*) on this point are ambiguous, and no Dutch edition of the *Speculum* printed, figures and text, from wooden blocks or movable wooden types, is known.

By the middle of the 19th century the claims of Coster and Haarlem had steadily gained ground, owing to the researches of Joh. Enschedé (1751), Meerman (1765), Koning (1815), Young Ottley (1816), Bernard (1853), Sotheby (1858) and others. But in 1870 they were wellnigh destroyed by a criticism which afterwards proved to be partly groundless, partly a distortion of facts. At the time, however, it was, without further research, accepted as decisive; the claims were regarded to be a fiction, and a system of classifying the incunabula started with the unfortunate result that Utrecht came to be adopted as the birthplace of the Costeriana and Coster and Haarlem almost obliterated from all our catalogues. Since then many things have come to light, all tending to confirm Haarlem's claims, and showing how unjustifiably they were attacked in 1870. An examination of the incunabula on which they rest is far from easy or inexpensive, as the books are scattered not only over Europe but now also over America, and therefore not easy of access. We have, however, made it, sufficiently to be able to prove that the claims are based on good grounds. Our evidence, though still circumstantial, is not based on guesses; we assert nothing except on bibliographical or historical grounds; nor do we accept one statement unless it is corroborated by other statements, or by the rules of bibliography and history. Hence we should not accept Zell's evidence or that of Junius, or of any one else, if the books to which they refer did not corroborate them to the fullest extent, or if the claims of Mainz to the honour of the invention could be said to have any substance of fact. The great efforts made in Germany since 1882 to strengthen the case for Gutenberg, which culminated in the celebrations of 1900 and the publication of valuable and learned books, have enriched our knowledge of early Mainz and German printing, but at the same time conclusively shown that it requires great courage to maintain that Gutenberg was the inventor of printing.

How long Coster or his successors continued the first printing-office at Haarlem we cannot say; it seems to have come to an end in or before 1481, as the cuts of the *Speculum* had evidently then passed into John Veldener's hands, and the Haarlem tradition says that wine-pots had been cast of the remains of the types. In 1483 Jacob Bellaert was printing at Haarlem, and Jan Andrieszn in 1485; their types are imitations of the writing of their time, but already differ from those of the *Speculum* and the other Costeriana in various respects, and show many features of a later period. The question as to whether they learnt their craft from the first Haarlem printer, or from other masters, has been asked but not yet answered.

Spread of Typography.—Having explained the early printing of Haarlem and Mainz, in so far as it bears upon the controversy as to where and by whom the art of printing was invented, and shown that the testimony of Ulrich Zell (in the *Cologne Chronicle* of 1499) as to Mainz having learnt the art of printing from Holland through the *Donatuses* printed there, and that of Hadrianus Junius, as to the tradition of its Haarlem origin, are confirmed by bibliographical and historical facts, we can follow its spread from Haarlem to Mainz, and from the latter place to other towns and countries.

1460; Strassburg.—First printers: Johann Mentelin, who completed a Latin Bible in that year, according to a rubrication in a copy at Freiburg in the Breisgau; Adolph Rusch de Inguilen, who is presumed to be the printer of the undated books with a singularly shaped R,[1] *c.* 1464; Henricus Eggestein, 1471; George Husner, &c.

1461; Bamberg.—First printers: Albrecht Pfister, who in 1461 published Boner's *Edelstein*, though it is still doubtful whether he did not print earlier, while he has always been regarded as the printer of B^{36} (see above); Joh. Sensenschmidt, *c.* 1480.

1465; Subiaco.—First and only printers: Conrad Sweynheym and Arnold Pannarts, who completed in that year an edition of Cicero, *De Oratore*, and Lactantius, and removed to Rome in 1467.

1466; Cologne.—Earliest printers: (1) Ulrich Zell, who published in that year Chrysostom, *Super Psalmo quinquagesimo liber primus*, though it is presumed that he printed already in 1463; (2) Arnold Ther Hoernen, 1470; (3) Johannes Koelhoff of Lübeck, 1470, who printed the *Cologne Chronicle* in 1499; (4) Nicolaus Götz, 1474; (5) Goiswinus Gops, 1475; (6) Petrus de Olpe, 1476 (not 1470); (7) Conradus Winter of Homburg, 1476; (8) Joh. Guldenschaaf, 1477; (9) Henricus Quentel, 1479, &c.[2]

1467; Eltville.—First printers: Nicolas and Henry Bechtermuncze and Wygandus Spyes de Orthenberg, who completed in that year a *Vocabularius ex quo*.

1467; Rome.—First printers: Conrad Sweynheym and Arnold Pannarts from Subiaco, who published an edition of Cicero's *Epistolae ad familiares*; Ulrich Hahn or Udalricus Gallus, who issued on the 31st of December 1467 Turrecremata's *Meditationes*.

1468; Augsburg.—First printer: Günther Zainer or Zeyner. Same year at Basel (first printer Berthold Rot of Hanau) and at Marienthal (Brothers of the Common Life).

1469; Venice.—Printers: (1) Johannes of Spires; (2) his brother Vindelinus of Spires; (3) Christopher Valdarfer; (4) Nicolas Jenson, &c.

The further spread of typography is indicated by the following dates: 1470 at Nüremberg (Johan Sensenschmidt, Friedr. Creusner, Anton Koberger, &c.), Berona or Beromünster in Switzerland (Helyas Helye *alias* De Llouffen), Foligno (Emilianus de Orfinis and Johannes Numeister), Trevi (Johann Reynard), Paris (first printers the three partners Ulrich Gering, Michael Friburger, Martin Krantz); 1471 at Spires, Bologna, Ferrara, Florence, Milan, Naples, Pavia, Treviso, Savigliano (Hans Glim?); 1472 at Esslingen, Cremona, Mantua, Padua, Brescia, Parma, Monreale (Mondovi), Fivizzano, Verona, Iesi, St Ursino (?); 1473 at Lauingen, Ulm (perhaps as early as 1469), Merseburg, Alost, Utrecht, Lyons, Messina, Buda-Pest, Santorso; 1474 at Louvain, Genoa, Como, Savona, Turin, Vicenza, Modena, Valencia; 1475 at Lübeck, Breslau, Blaubeuren, Burgdorf, Trent, Cracow (?), Reggio (in Calabria), Cagli,

[1] M. Philippe, *Origine de l'imprimerie à Paris*, p. 219, mentions two books printed in this type, which contain manuscript notes, to the effect that they were purchased in 1464 and 1467, so that Inguilen is to be placed before Eggestein.

[2] Johann Veldener, who is said to have printed at Cologne, was never established there, but at Louvain (1473–1477), Utrecht (1478–1481), and Culenborg or Kuilenburg (1483–1484); see Holtrop, *Mon. typ.*, pp. 42, 47, 109.

Caselle or Casale, Pieve (Piove) di Sacco, Perugia, Piacenza, Saragossa; 1476 at Rostock, Bruges, Brussels, Angers, Toulouse, Polliano (Pogliano), Pilsen; 1477 at Reichenstein, Deventer, Gouda, Delft, Westminster, Lucca, Ascoli, Bergamo, Tortosa, Palermo, Seville; 1478 at Oxford, St Maartensdijk, Colle, Schussenried (in Würtemberg), Eichstädt, Geneva, Vienne, Trogen (?), Chablis, Cosenza, Prague, Barcelona; 1479 at Erfurt, Würzburg, Nijmegen, Zwolle, Poitiers, Toscolano, Pinerolo, Novi, Lerida, Segorbe, Saluzzo; 1480 at London, St Albans (or in 1479), Oudenarde, Hasselt, Reggio (in Modena), Salamanca, Toledo, Nonantola, Friuli (?), Caen; 1481 at Passau, Leipzig, Magdeburg, Treves, Urach, Casale di San Vaso, Saluzzo, Albi, Antwerp, Rougemont; 1482 at Reutlingen, Memmingen, Metz, Pisa, Aquila, Promentoux, Zamora, Odense, Chartres, Wien, Guadalajara, München, Erfurt; 1483 at Leiden, Kuilenburg (Culenborg), Ghent, Chalons-sur-Marne (?), Gerona, Stockholm, Siena, Soncino, Salins; 1484 at Bois-le-Duc, Eichstätt, Novi, Sangermano, Chambéry, Udine, Winterberg, Klosterneuburg, Rennes, Loudéac, Tarragona; 1485 at Heidelberg, Ratisbon, Pescia, Vercelli, Tréguier or Lantreguet, Brünn, Salins, Burgos, Mallorca, Hijar, Palma, Xeres; 1486 at Münster, Stuttgart, Chiavasco, Voghera, Casal Maggiore, Abbeville, Schleswig, Toledo; 1487 at Ingolstadt, Gaeta, Rouen, Murcia, Besançon; 1488 at Stendal, Viterbo, Gradisca, Faro, Constantinople, Lantenac; 1489 at Hagenau, Kuttenberg, San Cucufat (near Barcelona), Portesio, Coria, Pamplona, Tolosa, Lisbon; 1490 at Embrun, Orleans, Grenoble, Döle; 1491 at Hamburg, Kirchheim, Norzano, Goupillières, Angoulême, Dijon, Narbonne; 1492 at Marienburg, Cluni, Zinna, Valladolid, Leiria; 1493 at Lüneburg, Freiburg (in Breisgau), Urbino, Cagliari, Lausanne, Nantes, Copenhagen, Rieka; 1494 at Oppenheim, Tours, Mâcon, Monterey, Braga; 1495 at Freisingen, Freiberg (near Leipzig), Scandiano, Forli, Limoges, Schoonhoven (monastery Den Hem), Pamplona, Wadstena, Cettinje; 1496 at Offenburg, Provins, Barco, Valence, Granada; 1497 at Carmagnola, Avignon; 1498 at Tübingen, Périgueux, Schiedam, Gripsholm; 1499 at Danzig, Olmütz, Montserrat, Madrid; 1500 at Pforzheim, Sursee, Perpignan, Valenciennes, Jaen.

Printing seems to have begun in Scotland after September 1507, when King James IV. granted a patent to Walter Chepman and Andrew Myllar (also printed Millar) for the establishment of a printing press at Edinburgh. Their first book (*The Maying or disport of Chaucer*) appeared on the 4th of April 1508. Myllar, however, appeared to have been established there as a bookseller already in 1503 and to have published there his first book, Joh. de Garlandia *Interpr. vocabulorum equivocorum* (printed for him abroad) in 1505, his second *Expositio Sequentiarum* (also printed abroad) in 1506. (See Rob. Dickson and John Ph. Edmond, *Annals of Scottish Printing from 1507 to the 17th century*, Cambridge, 1890; Harry G. Aldis, *List of Books printed in Scotland before 1700*, Edinburgh 1904). Printing was introduced into Ireland at Dublin in 1551 by Humfrey Powell, who published in that year a verbal reprint of Whitchurch's edition of the Common Prayerbook of 1549. Printing in *Irish types* was brought into the kingdom in 1571 by N. Walsh and John Kearney, the first book printed in that type being *A Catechism*, written by Kearney.

Above we have stated that printing was established at Avignon in the year 1497. But during the last two decades various treatises have been published endeavouring to show that printing had already been exercised there more than half a century earlier.

Question of Date at Avignon.

In 1890 the Abbat Requin discovered at Avignon, in three notarial registers, five Latin notarial Protocols of the years 1444 and 1446, which, though they mention only the arts of "writing artistically," and painting different colours on stuffs, he and others interpreted as showing that, during those years, certain artisans had exercised the art of printing with movable types at Avignon; so that, if the art was not invented there, one of those artisans must have learnt the secret from Gutenberg, said to have been engaged in printing at Strassburg from 1436 to 1439. And hence Avignon, hitherto regarded as the 60th town where printing was introduced, was to take the second place, if not the first, in the history of the invention of printing, between Strassburg and Mainz (Requin, *L'Imprimerie à Avignon en* 1444, Paris, 1890; id., *Origines de l'imprimerie en France, Avignon*, 1444, Paris, 1891).

From Requin's first document (dated July 4, 1444) it appears that a silversmith, Procopius Waldfoghel, of Prague, residing at Avignon, had received from a magister Manaudus (also called Menaldus Vitalis, born at Dax, in the Département des Landes, *baccalaureus in decretis*, and student at Avignon) two alphabets of steel, two iron forms (frames?), one steel screw, 48 forms of tin, and divers other forms belonging to the art of *writing* (*duo abecedaria calibis et duas formas ferreas, unum instrumentum calibis vocatum vitis, quadraginta octo formas stangni necnon diversas alias formas ad artem* scribendi *pertinentes*), and promised to return these instruments (*ad usum* scribendi *pertinencia*) the moment Manaudus asked for them. The second document (dated August 27, 1444) makes no mention of tools or instruments, but is Procopius's bond for two sums of money (10 to 27 florins) which he had borrowed from Georgius de la Jardina; for the first he promised to instruct the said George in the art of *writing* well and seemly, and to do the necessary and suitable things for one month (*pro quibus promisit instruere dictum Georgium in arte* scribendi *bene et condecenter, et administrare necessaria et opportuna, hinc ad unum mensem*), on condition that neither of them should instruct anyone else in the said art of *writing*, without the consent of the other (*fuit tamen de pacto quod nullus non debeat instruere aliquem in dicta arte* scribendi, *nisi de licentia alterius*). The third document (March 10, 1446) is an agreement between Procopius and a Jew of Avignon named Davinus de Codarossia, who had advanced money to him and held property from him as security. The Jew had promised to teach Procopius to paint stuffs in different colours, and the latter had promised the Jew to make for him and to deliver to him "twenty-seven prepared Hebrew letters, well and properly cut in iron according to the science and practice of *writing*, which, two years ago, the said Procopius had shown and taught the Jew, together with instruments of wood, tin and iron (*Procopius promisit . . . judeo facere et factas reddere et restituere viginti septem litteras ebreaycas formatas, scisas in ferro bene et debite juxta scientiam et practicam* scribendi, *sunt duo anni elapsi ipsi judeo per dictum Procopium ostensam et doctam, ut dixit, una cum ingeniis de fuste, de stagno et de ferro*). It was also agreed that the Jew should pay for the tin and wood for the instruments of the Hebrew writing (*fuit de pacto quod idem judeus solvet stagnam et fustes artificiorum sive ingeniorum scripture ebrayce*). And Procopius further promised to give the Jew, the following week, ten florins to recover certain pledges or utensils which the Jew had in pawn from him, the latter binding himself not to reveal the science or teach the art to any one as long as Procopius should remain at Avignon or in the neighbourhood (*promisit eidem judeo dare decem florenos per totam hebdomadam proxime futuram et restituere sibi certa pignora sive ustensilia que ipse judeus habet in pignora a dicto Procopio*). The fourth document (April 5, 1446) shows that Procopius had made for the above-named Menaldus Vitalis and Arnaldus de Coselhaco (and Girardus Ferrosis?) and delivered to them several instruments or tools of iron, steel, copper, latten, lead, tin and wood for writing artistically; he had instructed them in the said art of *writing* artistically, and all the tools belonged to them in common. But Menaldus, wishing to sell his share in the said tools to the others and to retire from the association, twelve florins were paid to him in two instalments, but at the request of Procopius he testifies under oath that the said art of writing, taught him artistically by the said Procopius, was real and most proper, and also easy, practicable and useful to any one wishing and choosing to work it (*Cum dictus Procopius super* arte scribendi artificialiter *fecerit venerabilibus viris . . . Menaldo Vitalis et Arnaldo de Coselhaco . . . nonnulla instrumenta sive artificia causa* artificialiter scribendi *tam ferro de callibe, de cupro, de lethono, de plumbo, de stagno, et de fuste . . . dictamque artem scribendi artificialiter eos docuerit, instrumentaque ipsa omnia et singula sint . . . communia inter eosdem studentes . . . Cumque dictus . . . Vitalis cupiat . . . partem suam dictorum instrumentorum sive artificiorum . . . vendere et a communione eorum recedere . . . vendidit dicto Procopio et Girardo presentibus . . . partem suam . . . precio duodecim florenorum . . . Ibidem Vitalis . . . medio suo juramento . . . dixit . . . dictam artem scribendi per dictum Procopium artificialiter eidem doctam, esse veram et verissimam, esseque facilem, possibilem et utilem laborare volenti et diligenti eam*). The fifth document (April 26, 1446) shows that Procopius had recovered from Davinus all the pledges which he had pawned with him, except one mantle and 48 letters engraved in iron, that Davinus had not yet carried out his part of the agreement as to teaching Procopius the painting of different colours on stuffs, whereas Procopius had delivered to the Jew all the arts, tools and instruments pertaining to writing artistically in Latin letters, as he had promised to do on the 10th of March last. (*Procopius confessus fuit se ab eodem judeo recepisse . . . omnia pignora sua per eum penes dictum judeum impignorata, excepto uno mantello et quadraginta octo litteris gravatis in ferro. Et . . . dictus judeus confessus fuit . . . recepisse a dicto Procopio . . . omnia artificia, ingenia et instrumenta ad scribendum artificialiter in litera latina*, &c.) Again the compact is that Davinus shall not reveal the science to anyone, at least so long as Procopius should reside at Avignon or within 30 m. in the neighbourhood. (*nemini mundi dicere, notificare nec quovismodo revelare, per se nec per alium ullomodo, presentem scientiam in teorica nec pratica, et nulli mundi eam docere neque revelare eam fuisse ostensam per quemvis*).

It is difficult to find the art of printing with movable types, or the art of casting types in these documents. The Abbat, however, says they prove the establishment of a printing-office at Avignon in 1444, and he reads "*matrices*," "*caractères d'imprimerie*," *une* "*imprimerie*," and "*tout un matériel d'imprimerie*" in them, although the documents themselves do not mention such things; they only allude to the "art of *writing*," the "practice" or "exercise of *writing*"; the "art of *writing* well and seemly"; the "science and practice of *writing*"; the "art of *writing* artistically." And there is, apparently, no reason to think that these precise documents, while speaking exclusively of this art, should always mean another art which they do not mention. Procopius, indeed, seemed to have known an art of *writing*, in which he instructed others (second document) and which he and his associates wished to keep secret, while the "letters," tools, &c. of which they speak were no doubt "movable."

But Procopius himself appears to have possessed neither letters nor tools nor instruments or forms at the beginning of these proceedings; it was Menaldus Vitalis, a bachelor of law and student at Avignon, who entrusted to him the "two steel alphabets, two iron forms, one steel screw, and forty-eight tin and other forms," mentioned in the first document of 1444. Procopius, however, appears to have seen no permanent value in these letters, forms, &c. as he, of his own accord, promised to return them at the first request of Menaldus, who had handed them to Procopius without asking for a receipt. The third document, however, makes it plain that Procopius engraved for Davinus the Jew, not for himself, twenty-seven Hebrew letters (therefore a complete alphabet, including the five final letters) in iron, in accordance with the art of writing which he had taught Davinus two years ago, together with tools of wood, tin and iron, in return for which the Jew would teach Procopius the art of painting stuffs. The fourth document shows that Procopius had made tools of iron, steel and other metals for *writing* artistically, but again not for himself but for two other men one of whom was Menaldus who, two years ago, had entrusted him with two alphabets and some tools; Procopius, however, had this time reserved to himself a share in these tools, and Menaldus sold his share in the tools for twelve florins to the other associates, so that the value of all these tools cannot have amounted to more than about 36 florins of Avignon currency.

Therefore, the precise descriptions in the documents of the letters, tools and instruments required for Procopius's art of *writing* artistically, and the absence of all allusions to paper, ink and other things necessary for *printing* with movable types, show that there is no reference to this art, even in its infancy. That art means the multiplication of books or documents by means of an adequate quantity of single types for composing a whole page of text, and capable of being taken asunder and used again for a second, a third and a multitude of other pages, and so produce a number of copies of a book in the same or a shorter time than a scribe with his pen could produce one copy. But two Latin alphabets (of steel) and one Hebrew alphabet (of iron) would not suffice for composing and printing more than two or three words on any one page at a time, so that a person with such a small quantity of letters at his command would, in several respects, be worse off than a scribe. Hence the documents which only refer to the art of writing, mean nothing more serious than an art of taking impressions of certain letters (perhaps initials or capitals) in a more regular and steady fashion than even trained scribes could produce them by hand. For pressing in such (ornamental) initials or capitals here and there in MSS., after the scribes had done their ordinary work of writing, the insulated alphabets of Menaldus and Davinus would be a great help and save a deal of time and labour, but useless for the art of printing with movable types. If the two steel alphabets, and the one Hebrew alphabet of iron, and the 48 letters engraved in iron had been *patrices*, and the 48 forms of tin had been *matrices*, the documents, no doubt, would contain some expressions to show this, in spite of the endeavour not to divulge this art of writing. What the nature of this writing was, and why all these forms and instruments, even a screw, were required, we cannot say. It has been pointed out that the art of *printing* was also described as an art of *writing*, which is true; but when it is so described we learn at the same time that typography is meant. But we must bear in mind that Davinus the Jew was engaged on the painting of colours on stuffs and that Procopius desired to become acquainted with this industry. No doubt tools were much more required for this work than for writing. However, this writing association seems to have come to an end in 1446, and the parties departed from Avignon, without leaving there or anywhere else any trace of themselves and their interesting operations. See also Zedler, *Gutenberg-Forsch.*, p. 10 sqq.

As for non-European countries and towns, printing was established in Mexico in 1544, at Goa about 1550, at Tranquebar in 1569, Terceira in the Azores 1583, Lima 1585, Manila and Macao (China) 1590, in Haiti in the beginning of the 17th century, at Puebla in 1612, Cambridge (Mass.) 1638, Batavia 1668, Tiflis 1701, German-town 1735, Ceylon 1737, Halifax (Nova Scotia) 1766, Madras 1772, Calcutta 1778, Buenos Aires 1789, Bombay 1792, in Egypt (at Alexandria, Cairo, and Gizeh) in 1798, at Sydney 1802, Cape Town 1806, Montevideo 1807, Sarepta 1808, Valparaiso 1810, Astrakhan 1815, in Sumatra and at Hobart Town and Santiago (in Chile) in 1818, in Persia (at Teheran) in 1820, and at Chios about 1821.[1]

Customs of Early Printers.

Till the moment (say 1477) that printing was practised in almost all the chief towns of the Netherlands, Germany, Italy, Switzerland, France, Spain, England, not a single printer carried away with him a set of types or a set of punches or moulds from the master who had taught him, but, in setting up his printing office, each man cast a set of types for his own use, always imitating as closely as possible the handwriting indigenous to his locality, or of some particular manuscript which he or his patron desired to publish. When we compare Schoeffer's 30-line Indulgence of 1454 with a manuscript copy of the same Indulgence dated the 10th of April 1454, now in the hands of a private collector at Wiesbaden, we see that the types used in printing that document were specially cast for the purpose after the model of the handwriting employed for the written copies. We know also that the types of the 36-line and 42-line Bibles and those of the Psalter of 1457 are the closest possible imitations of the ornamental church handwriting customary at the time of their production. Also, when we compare the 31-line Indulgence of 1454 with the German blockbook called the *Enndtchrist*, and both in their turn with the German MSS. of that period (especially the manuscript portions in the printed copies of the Indulgences), we see that the cutter of the text type of the Indulgence, as well as the engraver of the blockbook, formed his characters according to some German handwriting (book hand) of the period. This imitation extended, not only to the shape of the individual letters of the alphabet, but likewise to all those combinations of letters (double *p*, double *f*, double *s*, *st*, *ti*, *tu*, *re*, *cu*, *ct*, *si*, *de*, *co*, *ci*, *te*, *ce*, *or*, *ve*, *po*, *fa*, *he*, *be*, &c.) and contractions (for *pro*, *-um*, *-em*, *-en*, *the-*, *uer*, *-bus*, *-bis*, *sed*, *am*, *tur*, *qui*, *quae*, *quod*, *secundum*, &c.) which were then, and had been for many centuries, in use by scribes. In most, if not all cases, the MSS. which the printers imitated were, as has been remarked above, indigenous to the place where they settled. Thus the first printers of Subiaco, though they were Germans and had most probably learnt the art of casting types and printing at Mainz, yet cut their types after the model of some Italian MS. which was free from any Gothic influence, but written in a pure Caroline minuscule hand, differing but slightly from the Caroline minuscules which the same printers adopted two years afterwards at Rome. The first Paris printers started in 1470 with a type cast entirely on the model of the Caroline minuscule handwriting then in vogue at Paris. John de Westphalia, who introduced printing into Belgium, used from the beginning a type which he calls Venetian. Therefore a great similarity (without absolute identity) between the types of two printers (*e.g.* Schoeffer and Ulr. Zell), should be attributed to the similarity of the handwritings which the printers followed, not to any attempt on their part to imitate each other's types. To this universal system (clearly discernible in the first twenty-five years of printing) of each printer setting up business with a new type cast by himself, there would be, according to the conjectures of some bibliographers, only two exceptions; one is Albrecht Pfister (see above); the other is the Bechtermuncezes of Eltville (see above).[2]

Unevenness of Lines.

Another important feature in the earliest books is that the printers imitated, not only the handwriting, with all its contractions, combined letters, &c., but all the other peculiarities of the MSS. they copied. There is in the first place the unevenness of the lines, which often serves as a guide to the approximate date of an early printed book, especially when we deal with the works of the same printer, since each commenced with uneven lines, and gradually made them less uneven, and finally even. The unevenness was unavoidable in manuscripts as well as in blockbooks; but in the earliest printed books it is regarded as evidence of the inability of the printers to space out their lines. If this theory be correct, this inability was perhaps owing to the types being perforated and connected with each other by a thread, or to some other cause which has not yet been clearly ascertained. In some incunabula we find some pages with uneven lines, and others quite straight in the same book. It is not impossible, however, that the unevenness was simply part and parcel of the system of imitating MSS., and that only gradually about 1473 or 1474, but in some cases later) printers began to see that even lines looked better than uneven. This seems clear when we observe that the imitation of MSS. was carried so far that sometimes things which deviated from the work of the scribe, but had accidentally been printed in, were afterwards erased and altered in conformity with the MS. The Paris Library, for instance, possesses two copies of the *Liber Epistolarum* of Gasparinus Pergamensis (printed at Paris in 1470), in both of which the initial G of the first line and the initial M of the fourth line were printed in, and, whilst they have been allowed to

[1] On the introduction of printing in various towns, consult Henry Cotton, *A Typog. Gazet.*, 8vo, Oxford, 1831 and (second series, 8vo, Oxford, 1866); (P. Deschamps) *Dict. de géogr. à l'usage du libraire*, (8vo, Paris, 1870); R. C. Hawkins, *Titles of the First Books from the Earliest Presses Established in Different Cities in Europe*, (4to, New York, 1884); Rob. Proctor, *Early Printed Books in the British Museum*, (1898), &c.

[2] In recent years Dr Dziatzko, overlooking the relation between MSS. and typography in its infancy, has attempted to show that the types of the 36-line Bible were imitations of those of the 42-line Bible.

remain in one of the copies, in the other they were regarded as a fault and replaced by a rubricated L and M.

Initials. In the second place the initials of books or the chapters of books in MSS., and again in blockbooks and the earliest products of printing, were always, or at least in most cases (they are printed in the Indulgences of 1454), omitted by the scribe and the printer and afterwards filled in by the rubricator. As the latter artists were sometimes illiterate and very often filled up the gap by a wrong initial, we find in many MSS. as well as early printed books small letters written either in the margin or in the blank left for the initial, to guide the rubricator. In most cases where these letters (now called initial directors) were written in the margin, they were placed as much as possible on the edges of the pages in order that they might be cut away by the binder as unsightly; but in many incunabula they have remained till the present day.[1] Later on these initial directors were in many books printed in (in lower-case type) with the text. In all cases, whether written or printed, they were meant to be covered by the illuminated initial; but, as a matter of fact, the latter very seldom covers the initial director so completely as to make it invisible, and in various cases the intended illumination was never carried into effect. *Hyphens.* With respect to the hyphens, which were used in the 1454 Indulgences and the 36-line and 42-line Bibles, always outside the printed margin, some of the earliest printers did not employ them at the moment that they started their presses, and in the case of some printers the non-use or use of hyphens, and their position outside or inside the printed margin, serve as a guide to the dating of their products. After about 1472 they become more uniform in their shape and more generally used.

Signatures. The use of signatures was confined in MSS. mostly to mark the quires (with a numeral or a letter of the alphabet), sometimes also the leaves; in many cases they were written close to the bottom of the leaf, so that they might be cut off by the binder, which has happened in many cases, wholly or in part, as may be seen in many MSS.; in blockbooks they are usually printed with the picture on each sheet or page; they are not printed in incunabula close to the bottom line of the page before 1472 (at least in no earlier book with a date), when they appear in Joh. Nider's *Praeceptorium Divinae Legis*, published by Johan Koelhoff at Cologne. Caxton did not adopt them till 1480. In the books printed before 1472 they were written by the rubricator or the binder, in the same way as in the MSS.

Catchwords. Catchwords (custodes) were used for the first time about 1469 by Johannes of Spires, at Venice, in the first edition of Tacitus.

Pagination. Pagination or rather foliation was first used by Arn. Ther Hoernen, at Cologne in 1471, in Adrianus's *Liber de remediis fortuitorum casuum*, having each leaf (not page) numbered by figures placed in the end of the line on the middle of each right-hand page.

Slowness of Progress at First. The practice among early printers of imitating and reproducing MSS. was not abandoned till many years after the first dated document (1454) made its appearance; and, looking at the books printed, say from 1454 to 1477, from our present standpoint, the printing of that period may be said to have been almost wholly stagnant, without any improvement or modification. If some printers (for instance, Sweynheym and Pannarts at Subiaco and Rome, and Nicolas Jenson at Venice) produced handsomer books than others, this is to be attributed to the beauty of the MSS. imitated and the paper used rather than to any superior skill. Generally speaking, therefore, we shall not be far wrong in saying that the workmanship of Ketelaer and De Leempt's first book, published at Utrecht *c.* 1473, and that of Caxton's first book issued at Westminster in 1477, exhibit almost the same stage of the art of printing as the 1454 Indulgences. If, therefore, any evidence were found that Ketelaer and De Leempt and Caxton had really printed their first books in 1454, there would hardly be anything in the workmanship of these books to prevent us from placing them in that year. And conversely, if the Indulgences of 1454 had been issued without a date or without any names to indicate their approximate date, their workmanship might induce bibliographers to ascribe them to *c.* 1470, if not somewhat later. Even after 1477 alterations in the mode of printing books came about slowly and almost imperceptibly. It was no longer a universal system for printers to begin business by casting a type for themselves, but some received their types from one of their colleagues. And, though there were still many varieties of types, one sort began to make its appearance in two or three different places. The combinations of letters were the first to disappear; but the contractions remain in a good many books even of the 17th century.

Some theories have been based on, and others have been considered to be upset by, the supposition that the early printers always required as much type as printers of the present day, or at any rate so much as would enable them to set up, not only a whole quire of 4 or 5 sheets (=8 or 10 leaves=16 or 20 pages), but even two quires (=40 pages). Consequently calculations have been made that, for instance, the printer of the 42-line Bible required a fount of at least 120,000 characters. See Bernard, *Orig. de l'impr.* i. 164, who was a printer himself and speaks very strongly on this point. But there are numerous proofs that many early books were printed page by page, even when in small 4to. For instance, in some books it has been observed that portions of the types with which the text of the first, second or third pages of a quire had been printed, were used to "lock up" the types employed for the later pages of the same quire, as is evident from the blank impressions of such portions being found on these later pages. Again, in some small books, two, three or four blank leaves are found at the end, showing a miscalculation of the printer at the commencement. Moreover, numerous itinerant printers of the 15th century established a press for a short time wherever they went, which proves that the furniture of the earliest printing-offices cannot have been of any great extent.

Early Types and their Fabrication.—We must now take notice of two theories or traditions which have been current for a long time as to some intervening stage between the art of block-printing and the art of printing with movable cast metal types.[2] One theory or tradition would have it that the inventor of printing, after the idea of single, individual, movable types had arisen in his mind, practised his new invention for some time with wooden types, and that he came only gradually to the idea of movable types cast of metal.

Wooden Types. Junius gives us to understand that the Dutch *Speculum* was printed with such wooden types. Of Johann Gutenberg it was asserted that he printed his first Bible with wooden types. The Mainz psalter, printed in 1457 by Joh. Fust and Peter Schoeffer, was alleged to have been printed with wooden types, in which case the 4th edition, published in 1502, and even the 5th edition of 1516, would be printed with wooden types, the same being used for them as for the editions of 1457 and 1459. Theod. Bibliander was the first to speak (in 1548) of such types and to describe them: first they cut their letters, he says, on wood blocks the size of an entire page; but, because the labour and cost of that way was so great, they devised movable wooden types, perforated and joined one to the other by a thread.[3] Bibliander does not say that he had ever seen such types himself, but Dan. Speckle or Specklin (d. 1589), who ascribed the invention to Mentelin, asserts that he saw some of these wooden types at Strassburg.[4] Angelo Roccha asserted in 1591 that he had seen at Venice types perforated and joined one to the other by a thread, but he does not say whether they were of wood or of metal.[5] In 1710 Paulus Pater asserted that he had seen wooden types made of the trunk of a box-tree, and perforated in the centre to enable them to be joined together by a thread, originating from the office of Fust at Mainz.[6] Bodman, as late as 1781, saw the same types in a worm-eaten condition at Mainz; and Fischer stated in 1802 that these relics were used as a sort of token of honour to be bestowed on worthy apprentices on the occasion of their finishing their term.

Besides those who believed in these wooden types from the fact that the letters (especially in the *Speculum*) vary among themselves in a manner which would not be the case had they been cast from a matrix in a mould, there were authors and practical printers who attempted to cut themselves, or to have cut for them, some such wooden types as were alleged to have been used by the early printers. Some of them came to the conclusion that such a process would be quite practicable; others found by experiment that it would, in the case of small types, be wholly impossible. Nearly all the experiments, however, were made with the idea that the inventor of printing, or the earliest printers, started, or had to start, with as large a supply of type as a modern printer. This idea is erroneous, as it is known that, for a good many years after the first appearance of the art, printers printed their books (large or small) not by quires (quaternions or quinternions) but page by page.[7] Therefore, all considerations of the experimenters as to the impracticability of such wooden types, on account of the trouble and length of time required for the cutting of thousands of types, fall to the ground in face of the fact that the earliest printers required only a very small quantity of type, in spite of the peculiar forms (combined letters, letters with contractions, &c.) which were then in vogue. Up to

[1] The university library of Basel possesses a collection of the earliest Paris books still bound in their original binding, in which these initial directors are written not only on the outer edges, but on the inner sides of the pages, and so close to the back that they can only be seen by stretching the books wide open.

[2] We do not allude to Tritheim's assertion that the *Catholicon* of 1460 was printed from wooden blocks; for this story, which he declares he had heard from Peter Schoeffer, if it were true, would belong to the history of block-printing. Nor need we speak of Bergellanus's verses (1541), in which he distinctly alludes to carved blocks.

the present time no book or document has come to light which can be asserted to have been printed from single, movable, wooden types. But we have seen above that the Haarlem tradition, as told by Junius, distinctly points to such types having been used for, among other things, the first edition of the Dutch Spiegel, and no one examining this edition (of which two copies are preserved at Haarlem) would deny that there are grounds for this belief; the dancing condition of the lines and letters making it almost impossible to think that they are metal types. For how long and to what extent such types were employed, if at all, we cannot say.

Sculpto-fusi Types.

The other theory would have it that between block-printing and printing with movable cast types there was an intermediate stage of printing with "sculpto-fusi" types, that is, types of which the shanks had been cast in a quadrilateral mould, and the "faces," *i.e.* the characters or letters, engraved by hand afterwards. This theory was suggested by some who could not believe in wooden types and yet wished to account for the marked irregularities in the types of the earliest printed books.

Gerardus Meerman, the chief champion of this theory, based it, not only on the words of Celtes (*Amores*, iii. 3), who in 1502 described Mainz as the city "quae prima sculpsit solidos aere characteres," but on the frequent recurrence of the word *sculptus* in the colophons of the early printers (for Jenson and Husner of Strassburg, see p. 514 above). Sensenschmid in 1475 said that the *Codex Justinianus* was "cut" (*insculptus*), and that he had "cut" (*sculpsit*) the work of Lombardus, *In Psalterium*. Meerman also interpreted the account of the invention of printing by Trithemius[1] as meaning that, after the rejection of the first wooden types, the inventors discovered a method of casting the bodies only of all the letters of the Latin alphabet from what they called matrices, on which they cut the face of each letter; and from the same kind of matrices a method was in time discovered of casting the complete letters of sufficient hardness for the pressure they had to bear, which letters they were before—that is, when the bodies only were cast—obliged to cut.[2] In this way Meerman explained that the *Speculum* was printed in sculpto-fusi types, although in the one page of which he gives a facsimile there are nearly 1700 separate types, of which 250 alone are e's. Schoepflin claimed the same invention for Strassburg, and believed that all the earliest books printed there were produced by this means. Meerman and Schoepflin agreed that engraved metal types (*literae in aere sculptae*) were in use for many years after the invention of the punch and matrix, mentioning among others so printed the Mainz psalter, the *Catholicon* of 1460, the Eggestein *Bible* of 1468, and even the *Praeceptorium* of Nider, printed at Strassburg in 1476. But the difficulty connected with the process of first casting the shanks and afterwards engraving the faces of the types has become apparent to those who have made experiments; and it seems more probable that the terms *sculpere*, *exsculpere*, *insculpere*, are only a figurative allusion to the first process towards producing the types, namely, the cutting of the punch, which is artistically more important to the fabrication of types than the mechanical casting—all the more as Schoeffer in 1468 makes his *Grammatica vetus rhythmica* say, "I am cast at Mainz," an expression which could hardly be anything but a figurative allusion to the casting of the types.

Types Cast in Sand.

Granting that all the earlier works of typography preserved to us are impressions of cast-metal types, there are still differences of opinion, especially among practical printers and type-founders, as to the probable methods employed to cast them. It is considered unlikely that the inventor of printing passed all at once to the perfect typography of the punch, the matrix and the mould. Bernard[3] thought that the types of the *Speculum* were cast in sand, as that art was certainly known to the silversmiths and trinket-makers of the 15th century; and he accounts for the varieties observable in the shapes of various letters on the ground that several models would probably be made of each letter, and that the types, when cast by this imperfect mode, would require some touching up or finishing by hand. He exhibits a specimen of a word cast for him by this process which not only proves the possibility of casting types in this manner, but also shows the same kind of irregularities as those observable in the types of the *Speculum*.

But here again it is argued that in types cast by this or any other primitive method there would be an absence of uniformity in what founders term "height to paper." Some types would stand higher than others, and the low ones, unless raised, would miss the ink and not appear in the impression. The comparative rarity of faults of this kind in the *Speculum* leads one to suppose that, if a process of sand-casting had been adopted, the difficulty of uneven heights had been surmounted either by locking up the forme face downwards, or by perforating the types, either at the time of casting or afterwards, and holding them in their places by means of a thread or wire. To this cause Ottley attributed the numerous misprints in the *Speculum*, to correct which would have involved the unthreading of every line in which an error occurred. And, as a still more striking proof that the lines were put into the forme one by one, in a piece, he shows a printer's blunder at the end of page 42 in the unmixed Dutch edition, where the whole of the last reference-line is put in upside down, thus:—

Noe vnas bespot slapende ende niet waetende.
Genesis ix capitel.

A "turn" of this magnitude could hardly have occurred if the letters had been set in the forme type by type.

Types Cast in Clay Moulds.

A second suggested mode is that of casting in clay moulds, by a method very similar to that used in the sand process, and resulting in similar peculiarities and variations in the types.

Ottley, who was the chief exponent of this theory, suggested that the types were made by pouring melted lead or other soft metal into moulds of earth or plaster, after the ordinary manner used from time immemorial in casting statues of bronze and other articles of metal. But the mould thus formed could hardly avail for a second casting, as it would be scarcely possible to extract the type after casting without breaking the clay, and, even if that could be done, the shrinking of the metal in cooling would be apt to warp the mould beyond the possibility of further use. Ottley therefore suggests that the constant renewal of the moulds could be effected by using old types cast out of them, after being touched up by the graver, as models—a process which he thinks will account for the varieties observable in the different letters, but which would really cause such a gradual deterioration and attenuation in the type, as the work of casting progressed, that in the end it would leave the face of the letter unrecognizable as that with which it began. It would, therefore, be more reasonable to suppose that one set of models would be used for the preparation of all the moulds necessary for the casting of a sufficient number of types to compose a page, and for the periodical renewal of the moulds all through the work, and that the variations in the types would be due, not to the gradual paring of the faces of the models, but to the different skill and exactness with which the successive moulds would be taken.

It is evident that the sand and clay methods of casting types above described would be slow. The time occupied after the first engraving of the models in forming, drying and clearing the moulds, in casting, extracting, touching up and possibly perforating the types required for one page, would exceed the time required by a practised xylographer for the cutting of a page of text upon a block. But he that has gone through the trouble of casting separate movable types has a clear gain over the wood-block printer in having a fount of movable types, which, even if the metal in which they were cast were only soft lead or pewter, might be used again and again in the production of any other page of text, while the wood block can only produce the one page which it contains. Moreover, only one hand could labour on the xylographic block; but many hands could be employed in the moulding and casting of types, however rude they might be. Bernard states that the artist who produced for him the few sand-cast types shown in his work assured him that a workman could easily produce a thousand such letters a day. He also states that, though each letter required squaring after casting, there was no need to touch up the faces.

Polytype.

A third suggestion was made as to the method in which the types of the rude school may have been produced. This may be described as a system of what the founders of about 1800 called polytype, which is a cast or facsimile copy of an engraved block, matter in type, &c.

Lambinet,[4] who is responsible for the suggestion, based upon a new translation of Trithemius's narrative, explains that this process really means an early adoption of stereotype. He thinks that the first printers may have discovered a way of moulding a page of some work—an *Abecedarium*—in cooling metal, so as to get a matrix-plate impression of the whole page. Upon this matrix they would pour a liquid metal, and by the aid of a roller or cylinder press the fused matter evenly, so as to make it penetrate into all the hollows and corners of the letters. This tablet of tin or lead, being easily lifted and detached from the matrix, would then appear as a surface of metal in which the letters of the alphabet stood out reversed and in relief. These letters could easily be detached and rendered mobile by a knife or other sharp instrument, and the operation could be repeated a hundred times a day. The metal faces so produced would be fixed on wooden shanks, type high, and the fount would then be complete. Lambinet's hypothesis was endorsed by Firmin-Didot, the renowned type-founder and printer of Lambinet's day. But it is impossible to suppose that the Mainz psalter of 1457, which these writers point to as a specimen of this mode of execution, is the impression, not of type at all, but of a collection of "casts" mounted on wood.

Yet another theory has been proposed by Dr Ch. Enschedé, head of the celebrated type foundry of the same name at Haarlem, who says (pp. 15 sqq. of his *Technisch onderzoek naar de uitvinding van de Boekdrukkunst*, 1901), that the principle of a printing surface

[1] *Annales Hirsaugienses*, ii. 421: "Post haec inventis successerunt subtiliora, inveneruntque modum fundendi formas omnium Latini alphabeti literarum, quas ipsi matrices nominabant, ex quibus rursum aeneos sive stanneos characteres fundebant, ad omnem pressuram sufficientes, quos prius manibus sculpebant."

[2] *Origines typographicae*, app. p. 47 (The Hague, 1765).

[3] *Origine de l'imprimerie*, i. 40.

[4] *Orig. de l'imprimerie* i. 97 (2 vols. 8vo., Paris, 1810).

composed of separate pieces was known to the block-printer, but he would have found it impossible to use small insulated blocks of wood for printing, or to manufacture them for that purpose with the necessary mathematical precision. Hence the idea of separate movable characters was not the invention of printing, but the art of casting them, and this was a work not for the block-printer, but for another industry, for a foundry.

Enschedé Theory.

From the types of B^{36} and B^{42} Enschedé concludes that Gutenberg's punches (patrices) were made, like the bookbinders' stamps, of yellow copper (brass, Germ. *Messing*). With such patrices only leaden matrices could be made, but the latter could be produced in two ways: the lead can be poured over the patrix, or the patrix be pressed into cold lead. The first mode is somewhat complex, but the matrix would have a smooth surface, and need no further adjustment. The second mode is more simple, but requires great force, although lead is a soft metal. Moreover, the surface of the matrix has to be trimmed, as the impression forces the lead downwards and sidewards, which makes the surface uneven, though by this pressure the lead becomes firmer and more compact, to the advantage of the type-founder. Enschedé thinks that Gutenberg's letters must have been sharp, and that he obtained his matrices by the second mode; he had each letter engraved on a brass plate, 2mm. thick, therefore a mere letter without anything underneath it. This letter (patrix) was pressed, by means of a small flat plate, so far into the metal that its back formed one surface with the top part of the lead, and then removed. After the patrix and matrix had been made in this way, the letter was to be cast, and Enschedé believes that for this work Gutenberg used what in Germany is called the *Abklatsch*-method, which, after having been gradually improved, was at last superseded by more perfect machinery. By this method the letter was cast in two tempos. First the letter itself on a small plate; then the plate placed underneath a casting-form, to fix it to a small shank, which was to be cast into the form and would make, with the plate, the exact height of the letter. The letter on the plate was made not by pouring the metal into the matrix, but by beating the latter into the molten metal. When lead is heated so as to be a soft mass it easily assumes the form of any object which falls on or in it, therefore also of the matrix, which is the image of the engraved type. When the metal is not overheated it will immediately cool down by contact with the cold matrix, so that the latter will not be injured, although it consists of the same substance as the molten metal. In this way a great many letters can be cast from one matrix. Enschedé describes various difficulties connected with this method, and tells us that only large letters, like those of B^{36} and B^{42}, could be made by it, as the operation of adding the shank to the letter becomes impossible in the case of smaller letters. Hence Gutenberg, having conceived the idea of printing from seeing (!) the Dutch *Donatuses*, chose this large size of type for his work; for the smaller types of the 1454 Indulgences a copper matrix was required, which, in its turn, necessitated the use of a steel patrix, the introduction of which he ascribes, as others have done before him (*e.g.* Bergellanus), to Peter Schoeffer.

As to the Costerian types, their bad and irregular condition shows, he thinks, that they were produced from leaden matrices, and the latter from brass patrices, though wooden patrices are also possible, but not probable. All the tools, however, were imperfect, and the workmen inexperienced, and therefore bound to produce such imperfections as he finds in the *Abecedarium* and *Donatus* types. But the types were cast in one tempo; the *Abklatsch*-method would have been out of the question for them on account of their small size. In this way Enschedé thinks Coster, not having learnt his art from anybody, invented the type cast with the staff, in one tempo, while Gutenberg, having had a Costerian *Donatus* as his model, cast his large types in two tempos by the *Abklatsch* system till Peter Schoeffer, by means of his steel patrices, was able to cast smaller types such as those of the 1454 Indulgences, with staff and all.

Enschedé warns us that he is merely making suggestions as a type-founder, that he is not a bibliographer, and leaves the interpretation of documents to others. We quote his theories as coming from such a qualified type-founder, and because they have made some impression in certain quarters, but they lead us away from the real points connected with the invention of printing. First of all the "casting of metal types" is not, as he thinks, the *first* stage in the invention; its beginning, its essence is, and has always been thought to be, the *movability* of the characters. This movability, and the accidental way in which it was discovered, form together the pith of the Haarlem tradition as told by Junius. He indicates it, without using the word "movable," by saying that Coster, while walking in the Haarlem wood, cut some letters in the bark of a tree, and with them, "reversely impressed *one by one* on paper," composed one or two lines. Nothing seems more natural than that a block-printer (as the printer of the xylographically printed *Speculum* must have been) should cut such separate letters, and thereupon perceive that they could be used over and over again for a variety of words, on different pages, while those which he used to cut in a block only served him for one page and for one purpose. It is equally clear from the Haarlem tradition that the art of *casting metal* types was the *second* stage in the invention, a development or outcome of the primary idea of "movable letters," and the realization of their advantage, for Junius says that Coster "afterwards changed the beechen characters into leaden, and the latter again into tin ones." This also shows that the discoverer of the insulated movable wooden letters—after realizing, perhaps, that they could not endure much pressure, or missed (as Enschedé says) the mathematical precision necessary for his purpose—transformed himself from a woodcutter into a letter-founder, and had no recourse (as Enschedé would have it) for casting his types to a foundry apart from his own. As this transformation is possible and probable there seems to be no reason for departing from the simple but clear Haarlem tradition as we read it in Junius.

In the infancy of printing every printer, in different countries and different towns, starts with his own types; hence we may conclude that he had learnt the art of engraving and casting them himself, and so combined the art of type-founding with that of printing. This points back to a combination of the two or three arts in the first printing-office. It would be strange if the inventor of the movable letters, whom we have shown to have been a block-printer, and therefore acquainted with the art of engraving letters, and other mechanical contrivances connected with printing, had lacked the ability, which his immediate followers possessed, of imparting to his movable characters, by some means or another, that firmness and precision which he required for the realization of his invention. How long Coster had been a block-printer before he invented, and how long and to what extent he continued to use, the movable wooden letters, we cannot tell.

That Enschedé ascribes to Coster the invention of casting metal types with a shank (as they have been manufactured for centuries afterwards), and that of another mode of manufacturing types (the *Abklatsch*-method) to Gutenberg, suggested to the latter by *seeing* (!) the *Donatuses* printed at Haarlem, looks like an amiable attempt to get over the unpleasant tradition of the theft of Coster's types, but his theories are irreconcilable with the Haarlem tradition, with Zell's account of the relation between Dutch and Mainz printing and with bibliography in general.

It is not surprising that Enschedé's theories called forth others from Zedler (*Veröffentl.* i. 34), who argues as follows: Enschedé says rightly that the type of the Hague Dutch *Donatus* is more defective than that of any other 15th-century book, more than even that of the Paris *Donatus*. Such types could not have been cast from a copper matrix. But a printer who had derived his art of casting types from Gutenberg or one of his pupils, would hardly, after the introduction of the steel stamp and the copper matrix (necessary for manufacturing the small types of the 1454 Indulgences), have returned to the casting of a small type from a leaden matrix, and used, moreover, a process which remained, in its consequences, behind that of Gutenberg. Zedler then points to a peculiarity of the earliest Dutch incunabula already mentioned above, namely, the sign of contraction connected with some letters by a fine stroke, which he says is not (!) found in the Dutch block-books, or in the Dutch MSS. He thinks, therefore, that this stroke was required by the method of casting this type. The stamp for making the matrix cannot have been *a staff*, on the lower end of which the *reversed* letter was cut, but a mere letter without any footing. Consequently, it must have consisted of lead not wood, and have been manufactured in the same way as Gutenberg's type was made, according to Enschedé. Every sign of contraction had to be one whole with the letters to which they belonged to prevent their being shifted during the process of printing. The letters cast from the matrix made in this way had as foot a thin square plate which enclosed the letter but no staff, owing to the mode of making the stamp and the matrix. If the Dutch printer had intended to cast a type with a staff by means of a casting tool, however primitive, he would not have required the thin plate. But his letters, with a thin plate as their foot, required to be pasted on a sheet of strong paper, so as to be firmly connected in words and sentences for the purpose of printing. Hence the printer could regulate the spaces between the words, without using, like Gutenberg, spaces of a definite width for this purpose, so that he had no trouble in making the lines end evenly. From such a printing-surface with a firm footing, it was possible, after the ground had become hard, to obtain impressions just as from movable types enclosed in the forme. Zedler was told by an expert that, technically, there was nothing against such an explanation, but, he says, if it were correct, it would not solve the question, not yet satisfactorily answered, as to what we have to understand by the printed Dutch *Donatuses*. The "doctrinal jetté en molle" of Jean le Robert and the *libri impressi*, mentioned under the year 1450 in the *Memorial* of the monastery Weidenbach in Cologne would then be books printed from such printing plates with separately cast letters. In this way Zells' account in the *Cologne Chronicle* would be confirmed (!). We should also understand why the Dutch, though knowing the art of casting types, only printed *Donatuses* and similar small schoolbooks, for which there was much demand, for in the present day, stereotype-printing is likewise used for books which, when editions follow each other rapidly, have to be printed unaltered. In this case Gutenberg would not be the inventor of the cast letter. But the Dutch could not claim, with Enschedé, the honour of the invention of movable metal types. They invented the casting of letters, but it would be Gutenberg's merit to have invented the *movable* cast types. At any rate he would be the inventor of the casting instrument whereby the letter with the staff became independent, that is movable. The early Dutch printing letter, which could only be used by being firmly footed on a plate, would have missed its real value for printing, its free movability.

Zedler, for want of data, cannot say where and when Gutenberg learnt the technics of early Dutch printing, though the *Cologne Chronicle* tells us that from this printing his work began. But he thinks that the secret arts which occupied Gutenberg at Strassburg, and which, when the documents are impartially (!) considered, can be regarded as nothing but experiments in the printing of books, are earlier than 1440. He will not decide whether Gutenberg has been in Holland, or whether this historical kernel is the foundation of the Coster legend (!) of Adrianus Junius which is independent of the *Cologne Chronicle*. Anyhow, Gutenberg still required ten years of hard work and troublesome experiments, before he, basing himself on the early Dutch printing, whatever this may have been, could become the inventor of the present mode of printing books.

We here see how Enschedé's theories give rise to Zedler's structure of theories. When the former says that Gutenberg chose for his first work the large letters of B^{36} and B^{42}, because the Abklatsch-method (invented [?] by him) was only fit for large letters, he forgets that the printers of these Bibles, wishing to apply their new art to the production of copies of the Bible in a speedier way than the scribes of their time were able to do, had, of necessity, to design their types from the large ornamental church-hand then in vogue for Bibles, Psalters, Missals, &c. For the same reason they prepared different, much smaller, types for the Indulgences of 1454, as the manuscript copies of these Indulgences, handed to them as "copy," were written in the bastard Roman book-hand, used for such documents. When the arts of casting types and of printing with them found their way to Mainz they were new in that city, but they came there already well-developed, and the printers, whoever they were, knew how to prepare themselves for any book or document which it was thought desirable to print. But of these questions Enschedé takes no account. He ascribes the two Bibles to Gutenberg, because Dziatzko has done so, without inquiring whether Gutenberg (not Pfister) had, after all, anything to do with B^{36}.

Zedler's theories, partly developments, partly corrections of those of Enschedé's, are based on the misapprehension that a peculiarity in the Costerian types, *i.e.* the connexion of the signs of contractions by a fine stroke with the letters over which they stand, does not occur either in the Dutch blockbooks or in the Dutch MSS. This connexion, however, far from being not found, is a conspicuous feature, in the Dutch blockbooks and MSS., and being faithfully reproduced in the Costerian types, shows how near these types stand to the block-printing and MS. periods. Zedler does not explain how he would print with the plate-footed types, pasted on strong paper, which he ascribes to Coster. Nor does he say whether he ever examined the Costerian editions of the *Speculum*, *Donatuses*, &c., to see whether they showed any traces of such awkward contrivances.

After having done justice, we hope, to these latest theories, which, in spite of their great length, leave many things unexplained, it is a pleasure to read once more Junius's unvarnished account of the Haarlem tradition, which contains no intricate theories, but a simple explanation of the rise and progress of printing with movable (metal) types in that city. The reading of it shows that real facts can be explained in a few words, while theories require long explanations, first for explaining away the real facts, and then for explaining the theories, which after all lead us astray.

Shape of Earliest Type.

The shape and manufacture of the types used as early as *c.* 1470 do not seem to have differed materially from those of the present types. This is evident (1) from the shape of the old types which were discovered in 1878 in the bed of the river Saône, near Lyons, opposite the site of one of the 15th-century printing-houses of that city, and which there is reason to believe belonged once to one of those presses, and were used by the early printers of Lyons; (2) from a page in Joh. Nider's *Lepra moralis*, printed by Conrad Homburch at Cologne in 1476, which shows the accidental impression of a type, pulled up from its place in the course of printing by the ink-ball, and laid at length upon the face of the forme, thus leaving its exact profile indented upon the page; (3) from an entirely similar page (fol. 4^b) in *Liber de laudibus ac festis gloriosae Virginis* (Cologne, *c.* 1468). From the small circle appearing in the two last-mentioned types, it is presumed that the letters were pierced laterally by a circular hole, which did not penetrate the whole thickness of the letter, and served, like the nick of modern types, to enable the compositor to tell by touch which way to set the letter in his stick. The fact that in these two cases the letter was pulled up from the forme seems to show that the line could not have been threaded.

Vinc. Fineschi, *Notizie Storiche sopra la stamperia di Ripoli*, p. 49 (Florence, 1781), gives an extract from the cost-book of the Ripoli press, about 1480, which shows that steel, brass, copper, tin, lead and iron wire were all used in the manufacture of types at that period.[1]

[1] On the above theories and types consult T. B. Reed, *Old English Letter Foundries*, pp. 3–26.

History of the Earliest Types.—The history and nomenclature of the earliest types are practically a continuation of the history and nomenclature of the characters figured in the earliest blockbooks, wood-engravings and MSS. For instance, Gothic type was first used, say, about the year 1445; but Gothic writing, of which that type was an imitation, was already known and used about the second half of the 12th century and can be traced still farther back (see above). Again, the pure Roman type, which appeared about 1464, is nothing but an imitation of what in palaeography is called the Caroline minuscule, a handwriting which was already fully developed towards the end of the 8th century (see PALAEOGRAPHY).

The broad outlines of the history of the earliest types are as follows:—

Gothic.

Gothic type, of the angular or pointed kind, was first used by the Haarlem printer of the *Speculum*, *Donatus*, &c. (see specimen No. 1, taken from the British Museum copy of the *Speculum humanae salvationis*, mixed Latin edition), presumably *c.* 1445. An entirely similar but larger type (No. 2, taken from the British Museum copy of Ludovicus [Pontanus] de Roma, *Singularia*) was used, presumably by the same printer, *c.* 1465–1470. Gothic type appeared in Germany as a church type in 1454, in the 31-line Indulgence, presumably printed by Johan Gutenberg at Mainz (No. 3, from the Göttingen copy), and in the 30-line Indulgence (No. 4, taken from the British Museum copy), printed by Peter Schoeffer at Mainz. Type No. 3 was also used about the same time for the 36-line Bible, and type No. 4 for the 42-line Bible. Two much larger Gothic types appeared in the Psalter of 1457, published by Fust and Schoeffer (see Bernard, *Origine*, pl. vii.). In Italy Gothic type appears in 1468 (No. 5, taken from the British Museum copy of Cicero, *De oratore*, published at Rome by Ulr. Hahn, the 15th of December 1468, in small Roman type, with imprint in Gothic), but in a more rounded form; it is practically the ordinary Italian writing influenced by the Gothic. In France Gothic began to be used in 1473; in England it appears first in Caxton's type about the year 1480.[2] It was employed extensively in a great many of the earliest presses all over Europe, and continued to be used largely at all times, especially for Bibles, law books, royal proclamations, &c., and even to this day it is the national character of Germany. It is now usually called *lettre de forme*, *black letter* or *English* in English-speaking countries, *lettre flamand* in Holland, and *fractur* in Germany.

Bastard Italian or Roman.

Bastard Italian or bastard Roman was introduced in 1454 at Mainz in the 31-line (No. 6) and 30-line (No. 7) Indulgences. It is also called *lettre de somme*, some think from the *Summa* of Thomas Aquinas, printed in the type of the Bible of 1462 by Fust and Schoeffer. Varieties of this kind of type were, like the Gothic, much used by the earliest printers, as, for instance, the printer of the 1460 *Catholicon*, Mentelin of Strassburg, *c.* 1460, and Ulrich Zell at Cologne, *c.* 1466, &c. In England it appeared in the first three books printed (1478, 1479) at Oxford (No. 8, taken from the British Museum copy of Jerome's *Expositio in Simbolum Apostolorum* wrongly dated 1468 for 1478).

Roman.

Roman type, the Caroline minuscule of palaeography, was first used in Germany about 1464, Strassburg, by the printer whose fount of type is known by a peculiarly shaped R, and who on that account is usually called "the R printer" (No. 9, taken from the British Museum copy of Durandus, *Rationale*, of which the Basel library possesses a copy which was bought in 1464).[3] In Italy it appears in 1465 at Subiaco (see Bernard pl. xii. No. 19), at Rome in 1467 (*op. cit.* pl. xii. No. 20), but in all its purity at Venice in 1469, used by Johannes of Spires (*op. cit.* pl. xii. No. 25), and at Paris in 1470 (*op. cit.* pl. xiii. No. 25). In England it was not used before 1518, when Richard Pynson printed Pace's *Oratio in Pace nuperrima* (see facsimile in Reed's *Type Foundries*, p. 92).

Burgundian.

Burgundian type, or *gros batarde* or *secretary*, was first used about 1470–1472 by Colard Mansion at Bruges (No. 10, taken from the British Museum copy of *La Controversie de Noblesse*, *c.* 1471–1472). With a somewhat similar type (No. 11, taken from the British Museum copy of the *Recuyell*) William Caxton is presumed to have printed, likewise at Bruges, a set of five books, of which the *Recuyell of the History of Troye*, a translation of a work by Raoul le Fèvre, is the best known and was probably printed *c.* 1471.[4] To this same class belong the first type (No. 12, from the British Museum copy of the *Dictes*) used in England by William Caxton for the printing of *Dictes and Sayings of the Philosophers* (Nov. 18, 1477), and that used by the printer of St Albans (No. 13, taken from the Cambridge University Library copy of Aug. Dactus, *Elegancie*). It was an imitation of the manuscript hand of the English and Burgundian scribes of the 15th century, and, after having figured for a long time in several of the early London and provincial presses, was about 1534 entirely superseded by the English black letter. To this class of type

belong also the later *lettre de civilité* (*c.* 1570), the *script* (*lettre coulée, lettre de finance*, Dutch, *geschreven schrift*), *set court, base secretary*, and *running secretary* types.

On the types, illustrations, initials, &c., before 1500, consult also the facsimiles in Holtrop's *Mon. typ. des Pays-Bas* (the Hague, 1868); R. C. Hawkins, *First Books and Printers of the Fifteenth Century* (New York, 1884); William Blades, *The Life of Caxton* (London, 1861–1863); Bernard, *Origine de l'imprimerie*, vol. i. pls. iii.–xiii. (Paris, 1853); Placidus Braun, *Notitia de libris ab artis typogr. inventione usque ad annum 1479 impressis* (Augsburg, 1788); H. Noel Humphreys, *Hist. of the Art of Printing*, fol. (London, 1867); *Veröffentlichungen der Gesellsch. für Typenkunde des 15. Jahrhunderts.* Edd. Isak Collyn, Rud. Haupt, H. O. Lange, K. Haebler, V. Madsen, E. Voulliéme, vol. i, &c. (220 facs. published, Leipzig, 1907–); *The Woolley* [Geo. Dunn], *Photographs of Early Types* (400), designed to supplement published examples with references to the British Museum Index 1899–1904, 5 pts., folio; K. Burger, *Deutsche und italienische Inkunabeln, in getreuen Nachbildungen herausgeg.*, pts. 1–8 (200 pls.), folio (Berlin, 1892–); E. Gordon Duff, *Early English Printing*, a series of facs., folio (London, 1896); Ch. Enschedé, *Fonderies de caractères et leur matériel dans les Pays-Bas du 15me au 19me siècle*, fol. (Haarlem, 1908); Horace Hart, *Notes on a Century of Typography at the University Press, Oxford, 1693–1794*, folio (Oxford, 1900); Olgar Thierry-Poux, *Premiers monuments de l'imprimerie en France au 15me siècle*, fol. (Paris, 1890); *British Museum* (*Facsimiles from early printed books in the*), (1897), 32 pls. folio; *Type Facsimile Society*, folio (Oxford, 1900–).

The types after 1500 can best be learned from the catalogues of type-founders, among which those of Messrs Enschedé of Haarlem occupy a foremost place. Of others we may mention: *Indice dei caratteri nella stampa Vaticana*, 4to (Rome, 1628); *Épreuves des caractères qui se trouvent chez Claude Lameste*, 4to (Paris, 1742); *Épreuves des car. de la fonderie de Claude Mozet*, 8vo (Nantes, 1754); *Les Car. de l'imprimerie par Fournier le Jeune*, 8vo (Paris, 1764); *Proef van Letteren, Bloemen, &c., van Ploos van Amstel*, 8vo (Amsterdam, 1767); *Épreuve de car. de Jacques François Rosart*, 8vo (Brussels, 1771); *Schriften . . . bey J. H. Prentzler*, 4to (Frankfort-on-Main, 1774); *Épreuves des car. de la fond. de J. L. Joannis*, 8vo (Paris, 1776); *Épreuves des car. de la fond. de J. L. de Boubers*, 8vo (Brussels, 1777); *Proeve van Letteren welke gegooten worden door J. de Groot*, 8vo (the Hague, 1787); *Pantographie*, by Edmund Fry, 8vo (London, 1799); and *Manuale typographico*, by G. Bodoni, 4to (Parma, 1818).

Printers after 1500.—Though the *Cologne Chronicle* of 1499 denies to Mainz the honour of the invention of the art of printing, it was right in asserting that, after it had been brought there from Holland, it became more masterly and exact, and more and more artistic. During the first half-century of printing a good many printers distinguished themselves by the beauty, excellence and literary value of their productions. We may mention as such: Johan Fust and Peter Schoeffer at Mainz; Johan Mentelin and Heinrich Eggestein at Strassburg; Ulrich Zell at Cologne; Sweynheym and Pannarts at Subiaco and at Rome; Nicolas Jenson at Venice; Anton Koberger at Nuremberg; Ketelaer and De Leempt at Utrecht; Johan Veldener at Louvain, Utrecht and Kuilenburg; Gerard Leeu at Gouda; Johan of Westphalia at Louvain; and William Caxton (*q.v.*) at Westminster.

Very soon the demand for books increased, and with it came a reduction in their prices. This caused a decline in the execution of printing, which begins to be appreciable about 1480 in some localities, and may be said to have become general towards the end of the 15th century. At all times, however, we find some printers raise their art to a great height by the beauty of their types and the literary excellence of their productions. Among the later printers we may mention the Aldi of Venice (1490 to 1597); G. B. Bodoni of Parma (1768–1813); John Amerbach at Basel (1492–1516); John Froben at Basel (1496–1527); John Baskerville at Birmingham (1750–1775); the house of Weichel, first at Paris (*c.* 1530–1572), afterwards at Frankfort; Christopher Plantin at Antwerp (1554–1589); the Elzevirs, first at Leiden, afterwards at Amsterdam (1580–1680); Antoine Verard at Paris (1485–1513); Josse Bade or Badius at Paris (1495–1535); and the Estiennes at Paris (1502–1598).

Italic.

The Italic type[1] is said to be an imitation of the handwriting of Petrarch, and was introduced by Aldus Manutius of Venice for the purpose of printing his projected small editions of the classics. The cutting of it was entrusted to Francesco da Bologna, an artist who is presumed to be identical with the painter Francesco Francia or Raibolini. The fount is a "lower case" only, the capitals being Roman in form. It contains a large number of tied letters, to imitate handwriting, but is quite free from contractions and ligatures. It was first used in the *Virgil* of 1500. Aldus produced six different sizes between 1501 and 1558. It was counterfeited almost immediately in Italy, at Lyons and elsewhere. Originally it was called Venetian or Aldine, but subsequently Italic type, except in Germany and Holland, where it is called "cursive." The Italians also adopted the Latin name "characteres cursivi seu cancellarii." In England it was first used by Wynkyn de Worde in Wakefield's *Oratio* in 1524. The character was at first intended and used for the entire text of classical works. When it became more general, it was employed to distinguish portions of a book not properly belonging to the work, such as introductions, prefaces, indexes, notes, the text itself being in Roman. Later it was used in the text for quotations, and finally served the double part of emphasizing certain words in some works, and in others, chiefly translations of the Bible, of marking words not rightly forming a part of the text.

Greek.

Greek type (*minuscules*) first occurs in Cicero, *De officiis* printed at Mainz in 1465 by Fust and Schoeffer. The fount used is rude and imperfect, many of the letters being ordinary Latin. In the same year Sweynheym and Pannarts used a good Greek letter for some of the quotations in their edition of *Lactantius* (see, for instance, leaves 11a, 19a, 36a, 139, 140); but the supply was evidently short at first, as some of the larger quotations in the first part of the book were left blank to be filled in by hand. The first book wholly printed in Greek minuscules was the *Grammar* of Lascaris, by Paravisinus, at Milan in 1476, in types stated to have been cut and cast by Demetrius of Crete. The fount contains breathings, accents and some ligatures. The headings to the

[1] These paragraphs on the various types are for the most part taken from T. B. Reed's *History of the Old English Letter Foundries*, p. 50 seq. (London, 1887).

chapters are wholly in capitals. The *Anthologia graeca* of Lascaris was printed at Florence in 1494 wholly in Greek capitals (*litterae majusculae*), and it is stated in the preface that they were designed after the genuine models of antiquity to be found in the inscriptions on medals, marbles, &c. But as late as 1493 Greek type was not common, for in that year the Venice printer Symon Bevilaqua issued *Tibullus, Catullus* and *Propertius* with blanks left in the commentary for the Greek quotations. In England Greek letters appeared for the first time in 1519 in W. de Worde's edition of Rob. Whittington's *Grammatica*, where a few words are introduced cut in wood. Cast types were used at Cambridge in Galen's *De temperamentis*, translated by Linacre, and printed by Siberch in 1521, who styles himself the first Greek printer in England; but the quotations in the Galen are very sparse, and Siberch is not known to have printed any entire book in Greek. The first printer who possessed Greek types in any quantity was Reginald Wolfe, who held a royal patent as printer in Greek, Latin and Hebrew, and printed in 1543 two *Homilies* of Chrysostom, edited by Sir John Cheke, the first Greek lecturer at Cambridge. In Edinburgh, in 1563, and as late as 1579, the space for Greek words was left blank in printing, to be filled in by hand.

The Oxford University Press, re-established in 1585, was well supplied with Greek types, which were used in the Chrysostom of 1586. About 1607 Sir Henry Savile introduced Greek types (vulgarly called on account of their beauty "the silver letter") into Eton College, for printing his edition of St Chrysostom (8 vols., 1610–1613, John Norton), and other Greek authors. He afterwards presented this type to the university of Oxford. In 1632 Cambridge applied to Oxford for the loan of a Greek fount to print a Greek Testament, and the same university made an offer in 1700 for the purchase of a fount of the king's Greek at Paris, but withdrew on the French Academy insisting as a condition that every work printed should bear the imprint "characteribus Graecis e typographeo regio Parisiensi." It should not be forgotten that the large number of ligatures in the Greek of that day made the production of a fount a serious business. The Oxford Augustin Greek comprised no fewer than 354 matrices, the great primer 456, and Fournier's fount showed even 776 different sorts. The Dutch founders effected a gradual reduction of the Greek typographical ligatures. Early in the 19th century a new fashion of Greek, for which Porson was sponsor and furnished the drawings, was introduced, and has remained the prevailing form to this day. Cf. Rob. Proctor, *The Printing of Greek in the XVth Century*, folio (Oxford, 1900).

Hebrew. The first Hebrew types are generally supposed to have appeared in 1475 in Petrus Niger's *Tractatus contra perfidos Judaeos* (leaf 10), printed by Conrad Fyner at Esslingen. De Rossi states that a Hebrew work in four folio volumes entitled *Arba Turim*, of Rabbi Jacob ben Asher, was printed in 1475 at Pieve di Sacco in Austrian Italy, while in the same year, a few months earlier, Salomon Jarchi's *Comment. on the Pentateuch* appeared at Reggio in Italy, printed in the Rabbinical character. Numerous other Hebrew works followed before 1488, in which year the first entire Hebrew Bible was printed, with points, at Soncino, by a family of German Jews. The first English book in which any quantity of Hebrew type was used was Dr Rhys's *Cambro-Brytannicae Cymraecaeve linguae institutiones*, printed by Thomas Orwin in 1592, though already in 1524 Hebrew characters, but cut on small blocks of wood, were used by W. de Worde in Rob. Wakefield's *Oratio*. The Hebrew fount made use of in Walton's *Polyglott* in 1657 was probably the first important fount cut and cast in England, though there were as yet no matrices there for Rabbinical Hebrew. In the beginning of the 18th century Amsterdam was the centre of the best Hebrew printing in Europe.

Arabic. The first book printed in Arabic types is said to be a *Diurnale Graecorum Arabum*, printed at Fano in Italy in 1514.[1] Two years later P. P. Porrus's *Polyglott Psalter*, comprising the Arabic version, was printed at Genoa; and two years later a *Koran* in Arabic is said to have been printed at Venice. In 1505 an *Arabic Vocabulary* at Granada had the words printed in Gothic letters with the Arabic points placed over them; and in other presses where there were no Arabic types the language was expressed in Hebrew letters or cut in wood. De Guignes and others mention a fount of Arabic used by Gromors in Paris in 1539–1540 to print Postel's *Grammar*. In England some Arabic words were introduced in Wakefield's *Oratio* of 1524, but apparently cut on small blocks of wood. In Minsheu's *Ductor in linguas*, 1617, the Arabic words are printed in Italic characters. Laud's gift of Oriental MSS. to Oxford in 1635, and the appointment of an Arabic lecturer, were the first real incentives to the cultivation of the language by English scholars. Previous to this it is stated that the Raphelengius Arabic Press at Leiden had been purchased by the English Orientalist, William Bedwell; but, if it was brought to England, it does not appear to have been immediately made use of. The Arabic words in Thomas Greave's *Oratio de linguae Arabicae utilitate*, printed at Oxford in 1639, were written in by hand.

Syriac. Syriac type, probably cut in wood, first appeared in Postel's *Linguarum XII. Alphabeta*, printed in Paris in 1538; but the characters are so rude in form and execution as to be scarcely legible. In 1555, however, Postel assisted in cutting the punches for the Syriac Peshito New Testament, printed at Vienna in 4to, the first portion of the Scriptures, and apparently the first book, printed in that language. In 1569–1572 Plantin at Antwerp included the Syriac New Testament in his *Polyglott*, and reissued it in a separate form in 1574. In England Syriac was usually expressed in the earlier works in Hebrew characters. But in 1652, when the prospectus and preliminary specimen of Walton's *Polyglott* were issued, we find Syriac type in use.

Armenian. Of the Armenian character the press of the Vatican possessed a good fount in 1591, when Angelo Roccha showed a specimen in his *Bibliotheca Apostolica Vaticana*. A psalter is said to have been printed at Rome in 1565, and Rowe Mores mentions doubtfully a liturgy printed at Cracow in 1549. Armenian printing was practised in Paris in 1633; but the Armenian bishops, on applying to France for assistance in printing an Armenian Bible, in 1662, were refused, and went to Rome, where, as early as 1636, the press of the Propaganda had published a specimen of its Armenian matrices. The patriarch, after fifteen months' residence in Rome, removed to Amsterdam, where he established an Armenian press, and printed the Bible in 1666, which was followed in 1668 by a separate edition of the New Testament. In 1669 the press was set up at Marseilles, where it continued for a time, and was ultimately removed to Constantinople. In England the first Armenian type was that presented by Dr Fell to Oxford in 1667. The alphabet given in the prolegomena of Walton's *Polyglott* was cut in wood.

Ethiopic. Of Ethiopic the earliest type appeared in Potken's *Psalter and Song of Solomon*, printed at Rome in 1513. The work was reprinted at Cologne, in 1518, in Potken's *Polyglott Psalter*. In 1548 the New Testament was printed at Rome by some Abyssinian priests. The press of the Propaganda issued a specimen of its fount in 1631, and again in Kircher's *Prodromus Coptus* in 1636. Erpenius at Leiden had an Ethiopic fount, which in 1626 was acquired by the Elzevirs. Usher attempted to procure the fount for England; but, his attempt failing, punches were cut and matrices prepared by the London founders for the London *Polyglott*, which showed the Psalms, Canticles and New Testament in the Ethiopic version.

Coptic. Of Coptic the press of the Propaganda possessed a fount, and a specimen was issued in 1636, in which year also Kircher's *Prodromus Coptus* appeared from the same press. In England David Wilkins's edition of the New Testament was printed in 1716 from Coptic types cast with matrices which Dr Fell had presented to Oxford in 1667. The alphabets shown in the introduction and prolegomena to the London *Polyglott* of 1655 and 1657 were cut in wood.

Samaritan. Of Samaritan the press of the Propaganda had a fount in 1636, and the Paris *Polyglott*, completed in 1645, contained the entire Pentateuch in type, the punches and matrices of which had been specially prepared under Le Jay's direction. The fount used for the London *Polyglott* in 1657 is admitted to have been an English production, and was probably cut under the supervision of Usher.

Slavonic. With Slavonic type a psalter was printed at Cracow as early as 1491, and reprinted in Montenegro in 1495. The only Slavonic fount in England was that given by Dr Fell to Oxford, and this, Mores states, was replaced in 1695 by a fount of the more modern Russian character, purchased probably at Amsterdam. The *Oratio Dominica* in 1700 gives a specimen of this fount, but renders the Hieronymian version in copper-plate. ***Russian.*** Modern Slavonic, better known as Russian, is said to have appeared first in portions of the Old Testament, printed at Prague in 1517–1519. Ten years later there was Russian type in Venice. A Russian press was established at Stockholm in 1625, and in 1696 there were matrices in Amsterdam, from which came the types used in Ludolph's *Grammatica Russica*, printed at Oxford in that year, and whence also, it is said, the types were procured which furnished the first St Petersburg press, established in 1711 by Peter the Great. Mores notes that in 1778 there was no Russian type in England, but that Cottrell was at that time engaged in preparing a fount. It does not appear that this project was carried out, and the earliest Russian in England was cut by Dr Fry from alphabets in the *Vocabularia*, collected and published for the empress of Russia in 1786–1789. This fount appeared in the *Pantographia* in 1799.

Etruscan. A fount of the Etruscan character cut by William Caslon about 1733 for Swinton of Oxford was apparently the first produced. Fournier in 1766 showed an alphabet engraved in metal or wood. In 1771 the Propaganda published a specimen of their fount, and Bodoni of Parma in 1806 exhibited a third in his *Oratio Dominica*.

Runic. Runic types were first used at Stockholm in a Runic and Swedish *Alphabetarium*, printed in 1611. The fount, which was cast at the expense of the king, was afterwards acquired by the university. About the same time Runic type was used at Upsala and at Copenhagen. Voskens of Amsterdam had matrices about the end of that century, and it was from Holland that Francis Junius is supposed to have procured the matrices which, in 1677, he presented to Oxford. This fount appears in the

[1] See Panzer vii. 2.

Oratio Dominica of 1700, and in Hickes's *Thesaurus* (1703–1705), and it remained the only one in England.

Gothic. Matrices of Gothic type were presented to Oxford by Francis Junius in 1677, and a fount of them was used for the *Oratio Dominica* of 1700 and in Hickes's *Thesaurus*. A different fount was used for Chamberlayne's *Oratio Dominica*, printed at Amsterdam in 1715. Caslon cut a fount which appeared in his first specimen in 1734. This and the Oxford fount were the only two in England in 1820.

Scandinavian. Founts of Icelandic, Swedish and Danish were included in Junius's gift to Oxford in 1677, and were, perhaps, specially prepared in Holland. The first-named is shown in the *Oratio Dominica* of 1700 and in Hickes's *Thesaurus*. Printing had been practised in Iceland since 1531, when a *Breviary* was printed at Hoolum, in types rudely cut, it is alleged, in wood. In 1574, however, metal types were provided and several works produced. After a period of decline, printing was revived in 1773, and in 1810 Sir George M'Kenzie reported that the Hoolum press possessed eight founts of type, of which two were Roman, and the remainder of the common Icelandic character, which, like the Danish and Swedish, bears a close resemblance to the German.

Anglo-Saxon. For the Anglo-Saxon language the first type was cut by John Day in 1567, under the direction of Archbishop Parker, and appeared in Ælfric's *Paschal Homily* in that year and in the *Ælfredi res gestæ* of Asser Menevensis in 1574. Anglo-Saxon type was used by Browne in 1617, in Minsheu's *Ductor in linguas*; and Haviland, who printed the second edition of that work in 1626, had in 1623 made use of the character in Lisle's edition of Ælfric's *Homily*.

Irish. The first fount of Irish character was that presented by Queen Elizabeth to O'Kearney in 1571, and used to print the Catechism which appeared in that year in Dublin, from the press of Franckton. But the fount is only partially Irish, many of the letters being ordinary Roman or Italic. It was used in several works during the early years of the 17th century, and as late as 1652 in Godfrey Daniel's *Christian Doctrine*, printed in Dublin. The Irish seminaries abroad were better supplied with Irish type. A new type was cut by Moxon, and appeared in 1681 in Boyle's New Testament, printed by Robert Everingham.

Music. The earliest specimen of music type occurs in Higden's *Polychronicon*, printed by De Worde at Westminster in 1495. The square notes appear to have been formed of ordinary quadrats, and the staff-lines of metal rules imperfectly joined. In Caxton's edition of the same work in 1482 the space had been left to be filled up by hand. The plain chant in the Mainz psalter of 1490, printed in two colours, was probably cut in wood. Hans Froschauer of Augsburg printed music from wooden blocks in 1473, and the notes in Burtius's *Opusculum Musices*, printed at Bologna in 1487, appear to have been produced in the same manner; while at Lyons the missal printed by Matthias Hus in 1485 had the staff only printed, the notes being intended to be filled in by hand. About 1500 a musical press was established at Venice by Ottavio Petrucci, at which were produced a series of mass-books with lozenge-shaped notes, each being cast complete with a staff-line. In 1513 he removed to Fossombrone, and obtained a patent from Leo X. for his invention of types for the sole printing of figurative song (*cantus figuratus*). Before 1550 several European presses followed Petrucci's example, and music type was used, among other places, at Augsburg in 1506 and 1511, Parma in 1526, Lyons in 1532 and Nuremberg in 1549. In 1525 Pierre Hautin cut punches of lozenge-shaped music at Paris. Round notes were used at Avignon in 1532. In England, after its first use, music-printing did not become general till 1550, when Grafton printed Marbecke's Book of Common Prayer, "noted" in movable type, the four staff-lines being printed in red and the notes in black. There are only four different sorts of notes used—three square and one lozenge. About 1660 the detached notes hitherto employed began to give place to the "new tyed note," by which the heads of sets of quavers could be joined. But at the close of the 17th century music-printing from type became less common, on account of the introduction of stamping and engraving plates for the purpose. Cf. Rob. Steele, *The Earliest English Music Printing*, folio (London, 1903); Andr. Deakin, *Mus. Bibliogr.*, 8vo. (Birmingham, 1893).

Printing for the Blind. Printing for the blind was first introduced in 1784 by Valentin Haüy, the founder of the asylum for blind children in Paris. He made use of a large script character, from which impressions were taken on a prepared paper, the impressions being so deeply sunk as to leave their marks in strong relief and legible to the touch. Haüy's pupils not only read in this way, but executed their own typography, and in 1786 printed an account of their institution and labours as a specimen of their press. The first school for the blind in England was opened in Liverpool in 1791, but printing in raised characters was not successfully accomplished till 1827, when Gall of the Edinburgh asylum printed the Gospel of St John from angular types. Alston, the treasurer of the Glasgow asylum, introduced the ordinary Roman capitals in relief, and this system was subsequently improved upon by the addition of the lower-case letters by Dr Fry, the type-founder, whose specimen gained the prize of the Edinburgh Society of Arts in 1837. Several rival systems have competed in England for adoption, of which the most important are those of Lucas, Frere, Moon, Braille, Carton and Alston (see BLINDNESS).

Initials. The trouble and cost involved in the use of the initial director early suggested the use of woodcut initials, and Erhard Ratdolt of Venice, about 1475, is generally supposed to have been the first printer to introduce the *literae florenies*, called also *lettres tourneures*, or *typi tornatissimi*, which eventually superseded the hand-painted initials. Caxton introduced one or two kinds in 1484. Among the earliest to be used are the so-called Lombardic initials or capitals. The more elaborate initials, such as those used in the Mainz indulgences and psalter, by Aldus at Venice, by Johann Schoeffer at Mainz in 1518, by Tory and the Estiennes at Paris, by Froben at Basel, and by the other great printers of their day, were known as *lettres grises*. Besides these, the ordinary "two-line letters" or large plain capitals came into use; and these were generally cast, whilst the ornamental letters were for the most part engraved on wood or metal.

Ornaments and Flowers. Type ornaments and flowers began, like the initials, with the illuminators, and were afterwards cut on wood or metal. The first printed ornament or vignette is supposed to be the scutum or arms of Fust and Schoeffer in some copies of their 1457 Psalter, and of their edition of the Bible of 1462. There is no vignette in the Subiaco *Lactantius* of 1465 (as stated by Mr Reed, *Letter Foundries*, p. 82). In Holtrop's *Monum. typogr. des Pays-Bas* may be seen borders used by some of the earliest printers of Holland (1475–1490), which would not look bad even in the present time. Caxton in 1490 used ornamental pieces to form the border for his *Fifteen O's*. At the same time the Paris printers engraved still more elaborate border pieces. At Venice entire frames were engraved in one piece, while Aldus as early as 1495 used tasteful head-pieces cut in artistic harmony with his *lettres grises*. Early in the 16th century we observe detached ornaments and flourishes which have evidently been cast from a matrix.

II.—Modern Practical Typography

The printing surfaces used in the production of books and newspapers, apart from wood- or process-blocks and casts, and apart also from such surfaces as are obtained by means of the Linotype and kindred machines, are made up primarily of an aggregation of separate types, each representing a letter, mark or sign, though the actual surface employed on the printing press is frequently a duplicate copy made by a process of stereotyping or electrotyping.

Material Characteristics of Type.—A *fount* consists of a proportioned quantity of each of these letters and signs of any one particular body and face. It therefore contains single letters, both capitals ("upper case") and small letters ("lower case"), diphthongs, ligatures, such as ff, fl, accents, points, figures, fractions, commercial signs such as @, £, "peculiars" such as *, † and leaders (...), together with quads (pieces of metal which do not print, but are used to compensate for the shortness of occasional lines, as at the end of a paragraph), and spaces which separate words. A fount may thus have about 275 characters or *sorts*, about 100 of them consisting of italic letters, points and figures.

The numbers of the different sorts vary with different languages, and even with the style of different writers, the works of Charles Dickens, for instance, making unusually heavy demands on the vowels, while the writings of Lord Macaulay run with like persistence on the consonants. Type-founders determine the proportions of the different sorts according to a *bill of type*, or *scheme*, either numerically, when the basis of the computation is the number of lower case m's (or of A's, in the case of display type used for headings) or by weight. In the second method a fount of 125 lb of Roman type includes, on one scheme, 8 oz. of E, M, C; 9 oz. of T; 8 lb of e; 5 lb each of a, b, n, o, t; and so on down to 3 oz. of z. A fount of body-letters, that is those used for the reading matter of books and newspapers, as made up by one British type-founder, contains capitals 9% by weight, small capitals 4%, figures 6%, lower case letters, points and leaders 56%, spaces 15% and quads 10%; rules, accents and fractions not being supplied except in new complete founts or when specially asked for. A rule for estimating the quantity of type required for a page is to divide the number of square inches it contains by 4, when the quotient represents approximately the weight of type in lb. But for large founts 25% and for small ones 40% should be allowed in addition, on account of unused type in the cases, which cannot be completely set.

Logotypes. For many years it was a favourite idea with inventors, especially those who were not practical printers, that great economy might be gained in composition by the use of word characters, or "logotypes," instead of single letters. The constant recurrence of certain words such as "the," "and," "is," suggested that they, as well as affixes and suffixes like ad-, ac-, -ing, -ment, should be cast in single pieces instead of being set up with their component letters. Such logotypic printing was used in 1785 in the *London Daily Universal Register*, which three years later became *The Times*, but it has never found general favour. The chief practical objection is that it involves the use of cases with an inconveniently large number of boxes. The greater the variety of characters the more "travel" of the compositor's hand over the cases is necessary for picking them up, and by so much is the speed of his work retarded.

Parts of a Type. Each of the parts of a type has a technical name. In fig. 1, representing the capital letter M, the darkest space *a, a, a, a*, is called the *face*; and only that part of the type touches the paper in printing. The face is divided into the *stem*, marked 1, which comprises the whole outline of the type M; the *serifs*, or the horizontal lines marked 2, which complete the outline of the letter; the *beard*, consisting of the bevel or sloping part marked *b, b*, and the *shoulder* or flat portion below *b*. The shank is the entire body of the letter *d*, the front part (that shown) being known as the *belly* and the corresponding part behind as the *back*. The spaces at *h* and *h* are the *counters*, which regulate the distances apart of the stems in a line of type. The hollow groove extending across the shank at *e, e* is the *nick*, which enables the workman to recognize the direction of the type and to distinguish different founts of the same body. The absence of this simple expedient would retard the operation of hand-setting up by fully one-half. The earliest type-founders did not know the use of the nick. If a part of the face overhangs the shank, this part is called the *kern*, but kerned letters are avoided as much as possible. The groove *g* divides the bottom of the type into two parts called the *feet*. An impression from that part of a type on which it stands would be as ▀. Types must be perfectly rectangular, the minutest deviation rendering them useless. Any roughness at the sides is called *burr*, and any injury to the faces a *batter*.

Fig. 1.—Finished Type.

Species of Letter. Types which have the face cast in the middle of the shank, as a, c, e, m, &c., and thus leave an open space above them corresponding to that below, caused by the beard, are known as *short letters*. Those whose stem extends to the top of the shank, as b, d, f, &c., are called *ascending letters*. Those that have a stem extending over the shoulder, as g, p, &c., are called *descending letters*. Those that are both ascending and descending, and extend over the whole of the shank, as Q and j, are *long letters*. Small letters and figures cast upon the upper part of the shank, as 1^a, are called *superiors*; those very low down on the shank are *inferiors*, as H_2. Types that are very heavy and massive in appearance are called *fat-faced*; those that are fine and delicate, *lean-faced*. A type whose face is not in proportion to the depth of the shank (*e.g.* a small pica cast on a pica body) is a *bastard type*.

Sizes of Type. Types of are various sizes, from those used for the smallest pocket bibles to those used for large placards, and the sizes are classified according to the dimensions of their ends or *bodies*. In a given fount the length of the end of the type which bears the face is the same for all characters, but the width varies, an i for example being narrower than a w. Each body has a distinctive name, but it used to be a confusing and inconvenient anomaly that types made by different founders, though called by the same name, were not of precisely the same size. The long primer of one maker, for example, was 89 lines to the foot, of another 89½, and of a third 92. This inconvenience was remedied in America by the founders agreeing to adopt a uniform *point-system*; the pica of 0·16604 in. was taken as a standard, six picas being 0·996 in., and was divided into twelve parts or points of 0·013837 in., other types being cast as multiples of one of these points, and specified according to the number of them they contained. This system, with the same basic unit, has been adopted by British typefounders, though not to the exclusion of older sizes, and it has been extended to regulate the thickness or *set* of types, and also the position of the faces on the bodies as regards alignment. The Didot point-system, used in France, is based on a point of 0·376 mm., the English point being 0·35145 mm. The following are specimens of the principal bodies of ordinary British and American types, with their corresponding appellations on the point-system, the first five being now mainly for display purposes:—

[The larger type used in the body of this work is 10-point, and the smaller 8-point.]

The height of types is $\frac{11}{12}$ in. Those lower than the standard dimensions are said to be "low to paper," and if surrounded by higher types will not give perfect impressions. Spaces and quads are $\frac{3}{4}$-in. high for direct printing, but for stereotyping are cut rather higher (0·83 in.).

Varieties of Face.

According to the purpose for which they are used, types are divided into two classes—book type, including Roman and Italic; and job type, including a multitude of fanciful forms of letters, chiefly founded on the shape of the Roman and Italic letters, and intended to be more prominent, delicate, elegant, &c. It is impossible to enumerate all the varieties of the latter class, as additions are being constantly made and once popular styles always going out of fashion. The leading varieties are the antiques, which are Roman letters with strokes of nearly uniform thickness, as **M**; sanserifs or grotesques, which have no serifs, as M; blacks, as 𝔐; and scripts, which represent the modern cursive or Italian handwriting, as *M*. Black letter is now only a jobbing type in English-speaking countries, although it was the first character used in printing. It is still used in Germany, with certain modifications, as the principal text-letter for books and newspapers. A comparison of the numerous reproductions that have been issued of Caxton's works with any modern line of black letter will show how greatly the form and style have been altered. The present style of Roman type dates only from about the first quarter of the 18th century. Previously the approved shape was as follows:—

Printing has been defined to be the act, art, or practice

The use of this type was revived by Charles Whittingham, nephew of the founder of the Chiswick Press, about 1843, and it has since become a favourite form, under the name of old style. Some of the punches cut by the first notable English type-founder, William Caslon (1692–1766), have been preserved, and types are being constantly cast from them. Nearly all founders now produce modernized old style.

In this connexion reference may be made to the modern revival of artistic book printing in England by William Morris and others influenced by him. This development took definite form in the founts and books of the Kelmscott Press, which is distinguished by the use of three founts designed by Morris. The Troye and Chaucer founts, both Gothic, are best fitted for ornamented medieval works, while the Golden or Roman fount is without the exaggerated contraction of form laterally, the exaggerated use of thick and thin strokes, and the vicious stroke-terminations common to modern founts. It is a type of full body, designed in careful relation to the up and down strokes, and resting upon solid serifs, as with Jenson's fount, for instance, but in detail more allied to fine penmanship or black letter. The *Vale* books, often classed with the Kelmscott, may be counted with them so far as they also are controlled by one designer, from the important matter of type, decoration and illustration, to that of "build" and press work. The first Vale book in which these conditions were achieved is *Milton's Minor Poems* (1896). In this is employed the Roman type, known as the Vale fount, designed by Charles Ricketts, which differs from the Kelmscott fount in a greater roundness or fullness of body, and in a modification of details by the conditions of type-making. The second fount used in the Vale issues, first employed in *The Plays of Shakespeare* (1896), is less round in body, more traditional in detail and lighter in effect.

Manufacture of Type.—Type is made of an alloy, known as type-metal, which consists chiefly of lead, with smaller amounts of antimony and tin. The exact proportions vary in different countries and foundries and with the size and quality of the type, but in general more than 60% is lead and the antimony predominates over the tin. Sometimes small quantities of other metals, such as copper and iron, are added. Large letters, such as are used for bills and posters do not come within the province of the type-founder; they are made of wood, chiefly rock maple, sycamore, pine and lime, planed to the right size and engraved by special machinery.

Matrices for Type.

The earliest printers made their own types, and the books printed from them can now be distinguished with almost as much certainty as handwriting can be identified. The modern printer has recourse to the type-founder. The first step in the making of type, according to the old method, is the production of a *matrix*. The letter is cut on the end of a piece of fine steel, forming the punch (fig. 2), which is afterwards hardened. A separate punch is required for each character in every fount of type, and the making of them requires great care and delicacy in order that the various sorts in a fount may be exactly uniform in width, height and general proportions. During the process of its

FIG. 2.—Punch.

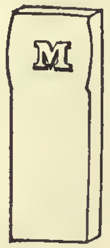

FIG. 3.—Drive.

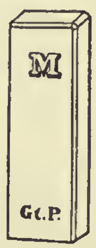

FIG. 4.—Matrix.

manufacture, the punch is frequently tested or measured by delicate gauges to insure its accuracy, and from time to time it is examined by means of a *smoke-proof*, that is, an impression obtained by holding it in a flame and stamping it on paper. When the letter is perfect, it is driven into a piece of polished copper, called the *drive* or *strike* (fig. 3). This passes to the justifier, who makes the width and depth of the faces uniform throughout the fount. They must then be made to line exactly with each other. When completed, the strike becomes the matrix (fig. 4), wherein the face of the type is made. But matrices are now commonly produced by the aid of an engraving engine which copies a standard drawing of each letter on any desired scale, and they may be obtained from existing founts by electrotyping.

Type Casting.

Until well into the 19th century types were cast from the matrices in small hand-moulds, the output from which with a skilful worker was about 400 letters an hour. The mould consisted of two portions fitting closely to each other and containing the matrix with a space to receive the metal for the shank; holding it in his left hand the operator poured in the metal with his right, and after jerking it at arm's length, to bring the metal well up against the matrix, opened the two halves and threw out the type. In 1838 David Bruce, Junr., of New York, a Scotsman, who had migrated to America, invented a machine to perform substantially the same operations; this increased the rate of production to about 100 a minute for ordinary sizes, and with improvements and modifications remained a standard appliance for 40 years after its introduction. The metal, kept molten by a small furnace, was injected by a pump into the mould, which at every revolution of the axle came up to the spout of the pump, received a charge of metal, receded, opened, and discharged the type. But neither the hand mould nor the Bruce machine produced finished type. To the bottom of each there was attached a wedge-shaped *jet* (fig. 5), somewhat similar to that on a bullet cast in a hand mould. This had to be picked off by hand; the burr on the shoulder of the types had also to be rubbed off, and a groove had to be cut in the bottom to form the feet. Many efforts were made to devise machines which should perform these operations and produce finished type, one of the most satisfactory being that patented by Henry Barth, of Cincinnati, in 1888, but the principle of the divided mould which opened to discharge the type was generally retained. A new principle, however, was adopted by Frederick Wicks (1840–1910) in his rotary type casting machine, which was developed into a practical apparatus in London just at the end of the 19th century, and which is able to produce finished types, ready to be despatched to the printer without any inspection or treatment beyond packing, at a

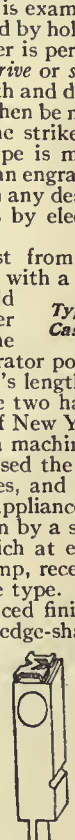

FIG. 5.—Type with jet.

continuous rate of 60,000 an hour. It consists of a horizontal mould wheel, 20 in. in diameter, contained in the casing D (fig. 6), in which are cut 100 radial slots, each having a matrix at its inner end. These slots thus form moulds, and are of varying width according to the letter each has to cast. Each wheel can only produce type of the particular body for which it has been cut, but by changing the matrices the moulds can be made to cast any description of face capable of being received upon the body. The wheel is rotated once in every six seconds, so that the slots are successively presented to a jet of molten type-metal, which is pumped from the

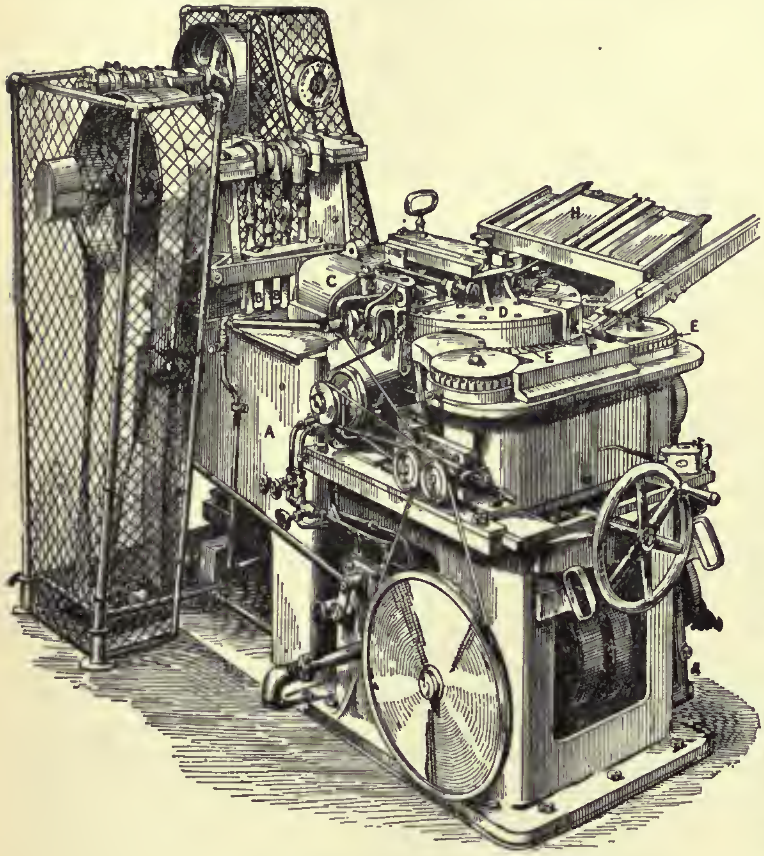

FIG. 6.—Wicks Rotary Type-casting Machine.

metal reservoir A by a pump B of special construction, and forced out at high pressure through a nozzle under the shield C. As soon as any particular slot has passed the jet and been filled with metal, a cam-action comes into play and gradually pushes out the formed type. This operation is completed in half a revolution, the ejected type being taken up by carriers mounted on a continuous chain E, which is moved along exactly in step with the wheel. The carriers, which are of different sizes according to the particular letters they have to hold, are raised by a cam-action as they come opposite the slots to receive the types, but fall again at the point F, depositing the letters at the end of the race G. Each successive type thus dropped pushes its predecessors farther along the race until when the row contains 200 types—the product of two revolutions of the wheel—an attendant lifts the whole series off and places them on the plate H, one row below the other. Since the sequence of the letters is of course the same in each revolution, the result is that each vertical line on the plate consists of the same character, and each sort can be easily removed and packed in any required form for despatch to the printer. As soon as each slot has been emptied of its type, another cam begins to draw in the matrix towards the centre of the wheel, so that it is in as far as it can go by the time the slot is again opposite the jet. To prevent a type from being drawn back with the matrix, the bead-cam K engages with the nicks which have already been formed on the front of the type-bodies by the operation of the machine. To ensure trueness and accuracy in the product, the conditions under which casting is conducted are maintained as uniform as possible. The composition of the type-metal alloy is kept constant; the temperature of the molten metal is carefully regulated by the aid of a pyrometer to about 800° F., so as not to volatilize the antimony it contains; the pumps work up to a pressure of 900 ℔ to the square inch, and by the interposition of a reducing valve deliver the metal at the nozzle at a constant pressure of 200 ℔; and the moulding slots are maintained at an equably cool temperature by an elaborate system of water circulation.

Type-case.

Type-setting by Hand.—The types, received from the foundry in the packages called pages, containing about 8 ℔, are placed in shallow trays called *cases*. These contain compartments or *boxes*, each of which is appropriated to some particular *sort* or character. The cases when in use stand on *frames* or sloping desks. The case at the top is the *upper case*, and that below the *lower case*. The former contains 98 equal-sized boxes, appropriated principally to the capital and small capital letters; the latter has 53 boxes of various sizes, appropriated to the lower case sorts. The difference in the size of the boxes corresponds to the difference of quantity of letters in a fount, the lower-case *e*, for instance, having the largest box. As a man picks out from the boxes seldom less than 1500 letters an hour and distributes or replaces on the average about

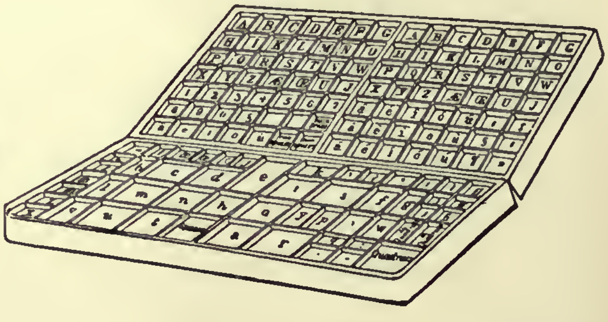

FIG. 7.—Type-case.

5000 an hour, it is necessary that the most economical allocation of the boxes should be adopted. The system of allocating the various types is called the *lay* of the case; one plan is illustrated in fig. 7.

Composing.

The types when taken from the cases are arranged in lines (*composed* or *set up*) in an instrument called a *composing stick*, made of iron, brass or gun metal. The slide in the middle is movable so as to accommodate varying lengths of lines. The compositor fixes the "copy" or document which he has to repeat in type, in a convenient place before his eye. In his left hand he holds the composing stick, and with the thumb and first finger of the right hand lifts the letters from the boxes, and arranges them in the composing stick, every letter, point or sign being picked out separately. In this operation he is much assisted by the use of a *setting-rule*, a thin brass or steel plate which, being removed as successive lines are completed, keeps the type in place. When so many words and parts of words as will nearly fill the line have been composed, it is made the exact length required by increasing or diminishing the space between the several words. This is called *justifying* the line and is effected by means of the spaces already mentioned. If the work is not "solid"—that is, if the lines are not close together—the strips of metal called *leads* or *brasses* are inserted between each. When the composing stick is filled, the type is lifted upon a *galley*, a shallow tray of wood or metal, two or three sides of which are flanged, for the purpose of supporting the type when the galley is slightly inclined. Stickful after stickful of type is placed on the galley until it is full. The matter is then fastened up, a *proof* taken at the proof press, and the work of the *reader* or corrector of the press begins (see PROOF-READING). The proof, marked with the necessary corrections, is given back to the compositor, in order that he may make the required alterations in the type.

Imposing.

The type, being duly corrected, is made up into pages of the required length (unless the author has desired to see proof in *slip*). It is then *imposed*, that is, the pages are arranged in such a manner that, when printed and the sheet folded, they will fall in due numerical sequence. The impression from any arrangement of pages will be the reverse of that in which they are laid down. If a four-page newspaper be opened and spread out with the first page uppermost, it will be found that on this side the order of pages is 4, 1; when turned the pages are 2, 3. The type pages must be ranged in the reverse way, as 1, 4; 3, 2. Thus the fourth page is placed alongside the first, because both must be printed together on the outside; the third page is to the left, and the second to the right, because in books the odd page—the verso—is always to the right. For a quarto a sheet of paper is folded twice, that is once across its breadth and then once in a perpendicular direction down the middle. It contains four leaves, and if these are printed on both sides eight pages. The two sides of a sheet are called the outer and inner formes respectively. A sheet of octavo is folded three times, making 8 leaves or 16 pages. The size of a book depends not only upon the number of times the sheet has been folded, and described accordingly as 4to, 8vo, 12mo, &c., but upon the size of the sheets. The dimensions of the papers commonly used in book-printing are: imperial, 22×30 in.; super royal, $20\frac{1}{2}\times27\frac{1}{2}$; royal,

20×25; medium, 19×24; demy, $17\frac{1}{2} \times 22\frac{1}{2}$; double crown, 20×30; double foolscap, 17×27; post, $15\frac{3}{4} \times 19\frac{1}{4}$. Hence to say merely that a book is a quarto gives no precise indication of its dimensions, as a quarto of one size of paper may be smaller than an octavo of another; it is also necessary to know the size of the sheets of which it is composed.

Signatures. When a printed book is opened, it will be found that at the foot of certain pages there is usually a letter and at the foot of another a letter and a figure, as B, B 2; farther on another letter and another letter and figure. On going through the book it will be seen that the letters are in regular alphabetical order, and occur at regular intervals of eight, twelve, sixteen, &c., pages. These designate the several sheets of which the book is composed and are called *signatures*, so that a sheet may be designated B, and the pages of which it consists are thereby sufficiently indicated. (Occasionally, numbers are used instead of letters.) These signatures assist the binder in folding, as they occupy a certain specified place in each sheet; hence to ascertain if the sheet has been folded properly it is only necessary to examine the position of the signature. The binder also is thus assisted in *gathering* or collating together the sheets of a volume in proper order. Signature A is omitted, because it would be on the title or first page, and would be both unnecessary and unsightly. By old custom J, V and W are discarded, I and J, U and V being originally used indiscriminately, by printers, while W was written UU or VV. When the alphabet is exhausted, a new one is begun, distinguished by a figure precedent, as 2 B, 2 C, &c.

Forme. The pages of types are arranged in proper order on a flat table, covered with stone or metal, called the *imposing stone*, and are then ready to be made into a *forme*, that is, into such a state that they can be securely fastened up and moved about. The forme is enclosed in an iron frame or *chase*, sub-divided by a cross bar. The portions of the type are separated by *furniture*, which may be of metal or wood or both. It is of the same height as the chase, but lower than the type, and therefore does not print, but forms the margin of the printed pages. As the sides of the two sections of the formes are pieces of furniture of a tapering shape, called *side-sticks*, and at the top and bottom corresponding pieces, called *foot-sticks*. Small wedges, called *quoins*, are inserted and driven forward by a mallet and a *shooting-stick*, so that they gradually exert increasing pressure upon the type. Other mechanical means for locking up are also occasionally adopted. When sufficiently locked up, the whole is quite as firm and portable, however many thousands of pieces of metal it may consist of, as if it were a single plate, and is ready for use on the printing press, either directly or in the form of a stereotyped or electrotyped copy.

Distributing. After use the type undergoes the operation of *distributing*, which is the converse of composing; it is de-composing the forme and returning the several letters to their proper boxes in the case. The forme is first washed over with an alkali or other detergent to remove the ink from its surface, and then laid down on the imposing surface, unlocked and damped; this assists the cohesion of the type, after the chase, furniture, side-sticks, &c., are removed. The compositor then takes in his left hand, supported by a setting rule, a portion of type in lines, and with the right hand takes a word or so between the finger and thumb, letting each letter drop separately into its proper box. The types are held upside down, that is, with the nicks uppermost; hence the letters of each word are read from left to right like ordinary matter when printed, but the words are of course dealt with in the inverse order.

Type-setting by Machine.—The above method of producing a printing surface depends entirely upon hand labour, but it has long been an object of inventors in connexion with printing to perfect a mechanical system by which hand-work may be done away with both in setting type and in distributing it after use. The first step in this direction was the construction of composing machines in which the compositor put together types in the required order, not by lifting them one after another from his "boxes" and placing them by hand in his "stick," but by operating a keyboard which liberated them from magazines and assembled them in the order in which the keys had been struck. Such machines were followed as a natural correlative by distributing machines which performed the converse operation. Then the idea occurred of avoiding distribution altogether, by returning the printing surface to the melting-pot and using the metal over again to produce an entirely new printing surface as required, instead of sorting the types into their various kinds to be set up again either by hand or by machine. There are two main solutions of this problem. One is to manufacture ordinary movable types at a cost that is less than that of distribution, when it obviously becomes advantageous to treat the formes, after use, as old metal and return them directly to the melting pot without distribution. In 1900 *The Times* began to adopt this method, thus securing the advantage of fresh new type for each issue. In its offices for several years type made by the Wicks casting machine was set up by composing machines, and after being used in making the necessary stereotype plates was returned to the foundry to be melted and recast. The other solution depends upon the employment of apparatus which are in effect combinations of type-setting and type-casting machines, and may be divided into two broad classes: (*a*) those in which, by the operation of a keyboard, letters are translated into metal types which appear as a product for use in the printing-press, not singly, but cast into complete bars or lines of type; and (*b*) those in which the final product is separate types, delivered made up into lines of the required length. The former class is exemplified by the Linotype, the Typograph, and the Monoline machines, the latter by the Lanston Monotype, the Tachytype and the Goodson. In machines of the Linotype class, which have come into extensive use, especially for newspaper printing, it is impossible to make corrections or alterations in the line of type after it has been cast. The smallest change, such as the addition of a comma, involves the resetting and recasting of a whole line, while, if two or three words have to be added or removed, the compositor may have to recast a considerable number of lines, perhaps a whole paragraph. Machines of the second class, like the Monotype, which has been employed for setting up the present edition of the *Encyclopaedia Britannica*, appeal rather to the book printer, though the Monotype is used by such newspapers as *The Times* (London) and the *Sun* (New York). They have the advantage that corrections can be made as with hand-set type; but for newspaper work the fact that the manipulation of the keyboard does not, as with the Linotype, directly produce a printing surface but merely a punched strip of paper, which has then to be passed through a separate casting machine, inevitably introduces some delay. This is a matter that must be taken into account in the hurried conditions under which a daily paper is produced, when the shortest possible interval must elapse between the time when the latest news is received and the actual printing is begun. A machine invented by Mr H. Gilbert-Stringer is designed to combine the advantages of the Linotype and Monotype machines by casting at a single operation separate types properly arranged in lines and uniformly spaced. Up to the point where the matrices are ranged in a line ready for the bar of type to be cast, the mechanism may be identical with that of the Linotype; from that point each matrix is separately pushed into a mould which is automatically varied in size to suit the size of the particular letter it is casting, and also casts the spaces between the words (determined by the use of a modified Schuckers wedge-space), so that when all the individual types and spaces in the line are assembled after casting they exactly fill the line. The machine requires only one operator, and while one line is being cast the matrices which have formed the preceding one are being distributed to the magazine, as in the Linotype, and the following one is being set up. The matrices differ from those of the Linotype in that the face is impressed on their broad flat surface, not on the thin edge.

Composing Machines.—An early attempt to make a machine for setting up ordinary foundry type was patented in England by Dr William Church in 1822. In the machine of Young and Delcambre, which was used in London for composing the *Family Herald* in 1842, and was the forerunner of the Kastenbein machine adopted in *The Times* office in 1869, the types were arranged in tubes placed either vertically or horizontally, and the lowest or endmost letter was, when wanted, ejected from the tube by a pusher actuated by a finger-key. It then passed down the channels of a guide-plate to a common point, whence it was pushed forward by a reciprocating motion to the line of previously composed matter and divided into lines of the required length. To the same group belong the Fraser machine, the Hattersley and the Empire, also known in America as the Burr. Another group of machines developed from the rotary composer was invented by Alexander Mackie of Warrington in 1871, and used in the office of the *Warrington Guardian*. In this the types were arranged in vertical tubes round a rotating disk, and the letters were automatically selected by a strip of paper previously punched with holes through which feelers passed and caused the desired type to be ejected upon a travelling band. This device of using a paper strip perforated in different positions to correspond to different letters was patented by Felt in 1860 (*U.S. Patent Spec.* No. 28,463), and he also utilized it for effecting distribution, the "dead" or used type being dealt with by another machine through which the paper strip was run in the reverse direction. This quality, however, was not so valuable as it might appear at first sight, since any correction, however simple, of necessity made the perforated paper ineffectual as a guide in distribution. The Thorne machine, exhibited in the Paris Exhibition of 1878, was a development of the principle of a rotating disk, but the types, which were contained in a vertical cylinder, were selected by touching keys in the ordinary manner. When liberated they fell upon a rotating table, whence they were deflected by a finger upon a travelling band and delivered into the composing race. The American Simplex machine resembles the Thorne very closely. The Wicks composing machine, again, adopts a different principle from both the above groups. The types are ejected upon a straight race set at an angle of 45°. Thus each has to travel a different distance from the other—a result which the inventors of the Delcambre group of machines were at pains to avoid; and when several keys are struck together so as to give a combination like "and," the several types delivered to the race follow each other in proper succession to the point of assembly, the letter whose key is nearest to the left side of the keyboard preceding those whose keys are more to the right.

The Paige composing, justifying and distributing machine—an American invention—is one of the most remarkable pieces of mechanism ever put together. It contains 18,000 parts, and the patent specifications form an imposing volume. It is operated by keys in the ordinary way, but automatic mechanism advances the ejected letters in words, spaces them and inserts the lines in the "galley" with "leads" if desired; at the same time other mechanism automatically distributes dead matter and refills the tubes which contain the supplies of types. Two machines were made, and are said to have done good work, but the cost of construction and the complicated nature of the mechanism made the apparatus impracticable commercially, and the two that were made are now on view as mechanical curiosities, the one in the Columbia Institute and the other in Cornell University. The Paige machine dispensed with the guide-plate of the Delcambre group, the letters being ejected on a plane along which a driver passed at intervals and swept the type into a receiving race on the left of the machine. The Dow composing and justifying machine, a later American invention, adopts this characteristic of the Paige, but has two drivers meeting at the centre of the plane which receives the letters. The types having been swept to the centre by these, a vertical driver forces them downwards into a vertical receiver. When a line has been set a justifying key is touched, the vertical line passes to a horizontal position, and is driven forwards to a point where apparatus measures it, and having removed temporary brass spaces replaces them with others selected from a series of ten different thicknesses.

Distributing Machines.—There are two main classes of distributing machines. One, which is exemplified by the Delcambre or the Fraser machine, is operated by a keyboard; the compositor strikes the keys corresponding to the letters of the printed matter he wishes to distribute, and thus opens gates through which the types pass and find their way down a guide-plate to their proper tubes. The other comprises a number of machines which agree in requiring the type to be specially nicked for their use. Each type has its own particular combination of nicks, and the receptacles in which the type is collated are provided at their entrances with wards corresponding to these nicks, so that each type can only enter the one receptacle for which its nicks are arranged (fig. 8). In some cases, as in the Empire and the Dow, the distributor is a separate machine; in others, as the Thorne and the Simplex, it is combined with the composing machine in such a way that the two work simultaneously.

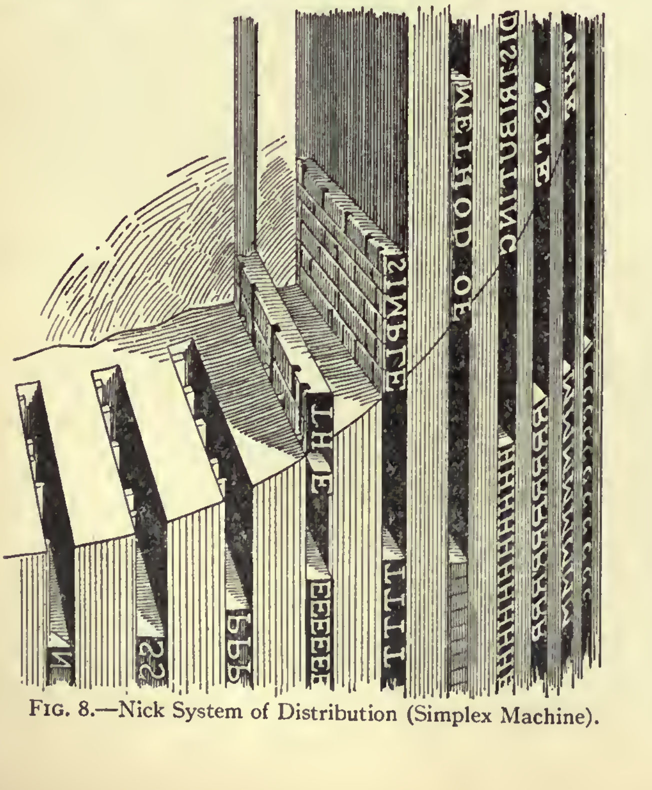

Fig. 8.—Nick System of Distribution (Simplex Machine).

Linotype.—An enormous amount of ingenuity has been expended on the Linotype, which was developed into a practical machine by

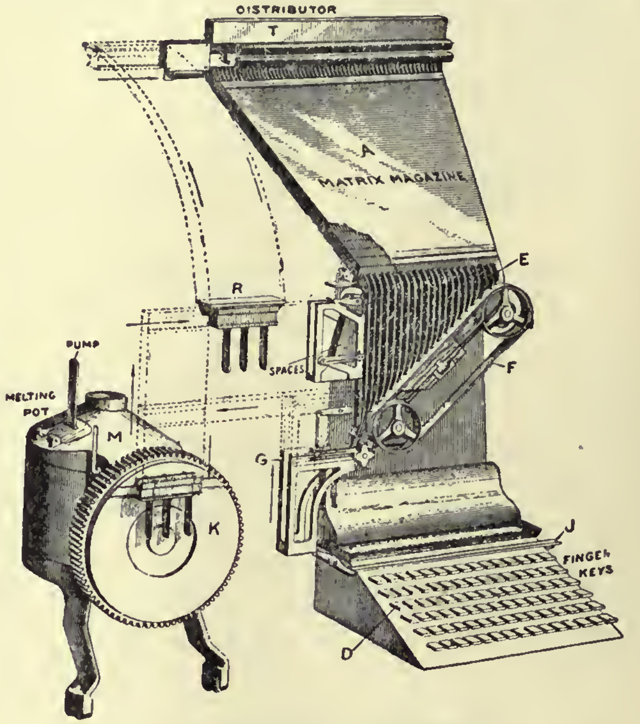

Fig. 9.—Diagram of Linotype Machine.

Ottmar Mergenthaler, of Baltimore, though two of its elements—the solid bar of type and the wedge space—were invented by others, the former by T. W. Smith, of the Caslon Foundry, and the latter by Jacob W. Schuckers, of Washington. The following will give a general idea of its working: In the magazine A (fig. 9) are a series of matrices, formed with the characters in intaglio on one edge, which are discharged by gates, operated from the keyboard D into the chutes E, and thence upon the travelling belt F; this delivers them upon a revolving pusher wheel by which they are set up in proper order in the assembler block G. Above the assembler block is a space magazine, and from this the space key J releases a space bar, when desired, which drops into place in the line. As the matrices are forced into the assembler block they move to the left against the resistance of a sliding abutment, thus being held compactly in place in the line. As soon as a complete line is set up, the compositor operates a hand lever by which the assembler block and matrices are raised to the level of a horizontal slide, where the line is grasped between two jaws and carried to the left, and lowered into position opposite the mouth of the mould wheel K. Here the justification of the line is effected by means of an upwardly moving plunger which drives the wedge-shaped spaces, seen in fig. 10, into the line, and thus expands it to the exact length required. The matrices are then locked firmly in a vice with the characters opposite the mouth of the mould. At this time the pump plunger in the melting pot M (fig. 9) is forced downwards by mechanism actuated by suitable cams on the driving shaft, and a jet of molten type metal is ejected into the mould and against the characters on the matrices, thus casting the bar or "slug." The cast bar is next forced, by a revolution of the wheel K, between a pair of knives, by which it is trimmed, and into a galley, where it is pushed along by a packer arm and placed beside its fellows in a column ready for use.

It is next necessary to distribute the matrices to the magazines, in order that the operation of the machine may be carried on continuously. The matrices and spaces are raised from the vice and brought opposite a bar R, which carries on its under side a series of undercut ribs corresponding to the teeth which are shown at the edges of the V-shaped notch in the top of the matrices (fig. 10) and the matrices are pushed on to this bar so as to be suspended by the ribs. They are next pushed still farther towards the right of the machine into a box having ribs engaging the notches in the side of the matrices, but with downwardly inclined grooves crossing these ribs, by which the shoulders at the upper end of the space bars are allowed to descend, and the spaces are thus dropped out of line and fall through a chute into the space-box from which they originally came. The matrices are pushed still farther to the right, where their teeth slide along the distributor bar T, being carried by two screws which engage opposite sides of the matrices and keep them separated so that they hang loosely from the distributor bar. The ribs of the distributor bar are so arranged as to support each matrix by one or more pairs of teeth until it arrives opposite the mouth of its own magazine channel, where they are interrupted in such a manner that the matrix is unsupported and drops into the magazine for further use. It will thus be apparent that there is a constant circulation of the matrices through the machine, and the composing of one line, the casting of another and the distribution of a third are all carried on at the same time, which adds greatly to the speed of the operation. The machine may be fitted with double magazine, which with double-letter matrices gives 360 characters or four faces ready for use, or even with three magazines, which provide for 540 characters or six faces, the movement of a hand lever bringing the desired magazine into use.

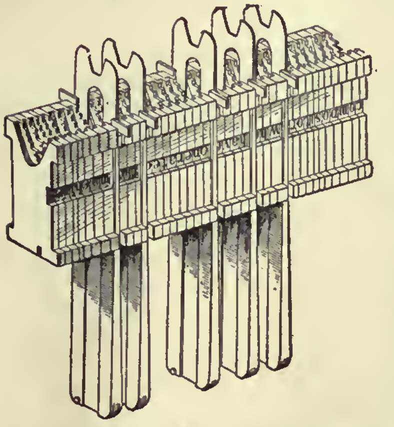

FIG. 10.—Line of Matrices with Spaces.

Lanston Monotype.—In the Lanston apparatus there are two distinct machines, a ribbon-punching machine and a type-casting and composing machine. The first of these is a small device resembling a typewriter, having a number of keys, 257 in all, corresponding to all the characters used in a fount of type, with some additions representing certain movements to be performed by the composing machine. These keys, when depressed, admit compressed air to a plunger or combination of two plungers working punches, whereby perforations are made in a strip of paper fed step by step through the machine. Most of the keys make two perforations, though some a single one only. These perforations stand in a transverse line across the strip, as shown in fig. 11, and their relative position in the line varies with the particular key operated. At the end of each word a spacing key is struck, and suitable perforations are made in the strip, and as the end of a line is neared, a bell rings to warn the operator, who, by looking at a line scale facing him on the machine, is enabled to see how many units of space remain to be filled, and can then determine whether another word or syllable can be set up. If not, it then becomes necessary to provide proper space-type to justify or fill out the line, which is done by increasing the width of the normal space-types already provided for in the proportion which the number of units of space still vacant in the line bears to the number of space-types which the line contains. For example, if there are ten space-types and $\frac{1}{10}$ of an inch of space remains to be filled, each space-type must be increased in thickness just $\frac{1}{100}$ of an inch completely to fill the line. It is not necessary, however, for the operator to make this calculation, for he has only to consult the scale provided for this purpose, and is referred at once to the proper keys to punch the justifying perforations in the strip. Each time the space key is depressed a pointer rises one step against a cylindrical scale placed vertically in front of the machine, and when the operator has finished setting a line he presses a special key which causes the cylinder to rotate until it automatically stops with the required number at the end of the pointer. This number is in the form $\frac{3}{4}$, and to complete the justification of the line the operator has only to depress the appropriate keys in the top two rows of the keyboard, in this case No. 3 of the top row and No. 4 of the second.

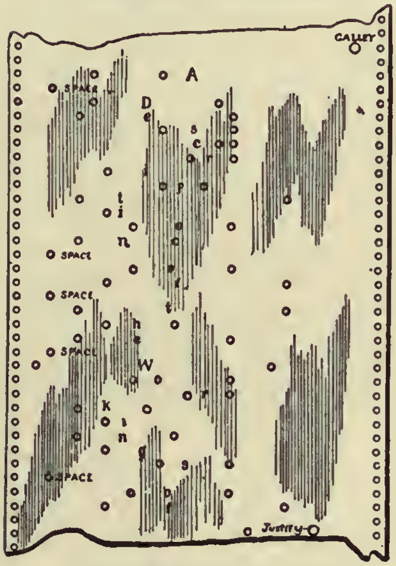

FIG. 11.—Perforated Strip.

The ribbon thus prepared in the punching machine is used to control all the movements of the casting or composing machine. The matrices for making the type faces are formed in a plate about 3 in. square, and any character is brought opposite the casting point by the movement of the matrix-carrier in two directions, or rather by the resultant of two such independent movements. As the perforations for controlling the galley movements and those for justifying the line are necessarily made after the others in the perforating machine, and these operations must be provided for in the composing machine before the line is set up, the latter machine is so organized that the ribbon is passed through and the types are set in the reverse order to that in which the strip was punched. The perforated ribbon is wound from one wheel off to another, passing over the edge of a tracker board in which there are a number of holes corresponding to those which may occur in the ribbon, and each of these holes communicates by a tube with a small piston which controls some device for performing one of the various operations of the machine. As the ribbon passes over the tracker board, a jet of compressed air passes to the appropriate operating device whenever a ribbon perforation or any combination of them coincides with the proper holes. The two perforations on each transverse line control two stop pins which limit the movements of the matrix-carrier to bringing the proper matrix to the casting-point, while the justifying perforations set in motion devices which open the space mould to cast space type of the exact size to effect the proper justification of the line, and the galley perforation starts the feeding device which moves the galley for the next line of type. The matrix-carrier may be readily removed and another carrying a different style or size of type substituted therefor.

In modern printing it is often the case that the printing surface actually used in the press (see PRINTING) is not the original forme of type, whether consisting of separate type set up by machine or by hand, or of Linotype slugs, but a reproduction of it made by electrotyping or by stereotyping. Of these two processes the former is the slower and the more costly, but it produces the better results, since electrotyped plates are capable of yielding a larger number of sharp impressions than are stereotypes.

Electrotyping.—In making an electrotype, a moulding composition consisting mainly of wax with a little blacklead, is poured when molten into a shallow metal tray, and, when it has set, its surface is brushed over with blacklead and polished. An impression of the forme, which is also blackleaded, is next taken in the wax while it is still warm, often by the aid of a hydraulic press, and the mould thus obtained, after being separated from the forme, undergoes a process of *building up*, which consists of dropping heated wax upon those portions which require to be more deeply sunk in the finished type, that is, upon those places where "whites" are to appear in the print. The face of the finished mould is then carefully covered with blacklead, which is a conductor of electricity, and the whole is immersed in an electrotyping bath, where copper is deposited on the blackleaded portions by means of the current from a Smee's battery or a dynamo machine. When the deposit, or *shell*, is sufficiently thick, it is disengaged from the wax mould, backed with a metal which resembles type-metal but contains a larger proportion of lead, and trimmed and planed. For use in rotary presses curved electrotypes may be produced.

Stereotyping.—The great advantage of stereotyping is in connexion with the production of newspapers, where the desideratum is the printing off of a large number of copies in a short time. For this purpose, in the first place, rotary machines must be employed, and stereotyping affords a ready means of obtaining curved printing surfaces to fit their cylinders. It is true that stereotyping is not absolutely necessary for rotary printing, since it has been found possible to print from movable type clamped on the cylinders in curved frames known as "turtles." But to set up duplicate formes of type is impracticable, and, therefore, this device does not permit the utilization of more than one press. Herein lies the second great advantage of stereotyping, for it enables the printer to obtain as many replicas of each forme as he desires, and thus not only to employ a number of machines simultaneously, but also to "dress" each of them with several duplicates of the same forme, as is required in the later developments of high-speed presses.

The first attempt at making stereotypes was by means of moist clay into which, after it had been impressed with the type and baked, molten type metal was poured; but this method did not yield a curved plate. Later the clay was replaced by papier-mâché, which being flexible can be bent to the required shape. This papier-mâché, known as *flong* and composed of several sheets of paper united by a paste capable of withstanding a high temperature without burning, is moistened and laid over the forme of type, into which it is well pressed either by beating with a long-handled brush or, according to the more modern and expeditious method, by being passed through a moulding press. The flong is next dried, for which purpose it is either placed with the type in a heated chamber covered with blankets which absorb the moisture, or is removed from the type and heated separately. Sometimes these two methods are used in combination; processes have also been devised for pressing the flong dry upon the type, when subsequent drying becomes unnecessary. For casting a plate the matrix thus prepared is fastened in a casting mould or *box* curved to the circumference of the cylinder of the press, and molten stereo-metal (a softer form of type-metal) is poured upon it. During this process the box stands upright, but while the matrix is being placed in position it lies horizontally, a swivel mounting enabling it to be readily turned. After time has been allowed for solidification, the cast is taken out, stripped from the matrix and adjusted on a "finishing saddle," where a machine cuts off the superfluous metal from its upper end and forms a bevel by which it can be clamped on the press. It is then placed face downwards in another machine which shaves out and smooths its interior surface, and finally it is set face upwards, while men with chisels remove protruding pieces of metal that might take ink and print.

Up to the end of the 19th century the general method of stereotyping was as outlined above, though of course there were variations in different establishments. The time required to produce a plate, as distinct from making the matrix, was about 1 or 1½ minute, and the process was expensive in labour since it required the employment of half-a-dozen men. This time may seem short enough, but when plates are needed by the score, as may be the case with a paper having a large circulation, the delay entailed by the preparation of the whole number by this method becomes of serious importance. Means were therefore sought to reduce it by the adoption of automatic mechanism. In the Autoplate machine, invented in America by Henry A. Wise Wood, and first used by the *New York Herald* in 1900, the operation of casting is performed automatically from the time the matrix is put in position until the finished plate is ready to be placed on the printing press, and from a single matrix four plates ½ in. thick, or seven or eight ¼ in. thick, can be produced every minute, by the aid of three men only. The casting is done against a horizontal cylinder or core, the interior of which is cooled by water. Below it is a frame or "back" carrying the matrix. This back has an up and down movement of about six inches, and when it is in its topmost position there is a semicircular space between it and the core equal in length, breadth and thickness to the plate which has to be cast. Molten metal having been injected into this space by a pump, there is a pause of a few seconds to permit of solidification, and then the back falls, bringing away the matrix with it. Immediately afterwards the cylinder makes a half turn, and presents what was previously its upper half to the matrix for another cast. The first cast is taken with it as it turns, and is then pushed along from the top of the core against two rotating saws which trim its edges. Next it comes under a shaving arch, where it pauses while its interior surface is smoothed to proper thickness, and finally water is directed against its back, to cool it without wetting its printing face. The Junior Autoplate is a simpler machine which does not perform so many operations. In it the casting core is vertical, not horizontal, but the matrix is still automatically stripped from the plate, the casts are made alternately on the two halves of the cylinder, and as one plate is being removed another is being cast. The machine also automatically cuts off the sprue which is left on the top of the plate as it stands in the casting box. About three plates a minute are produced, but they are not delivered completely finished, and have to undergo several further operations before they are ready to be placed on the press. The Double Junior consists of two Junior Autoplates served from a common melting-pot, and its capacity is six plates a minute, with two matrices; and another machine, the Autoshaver, has been devised which can shave, cool and deliver that number of plates automatically, no labour being required except to take the plate from the casting machine and place it on the Autoshaver.

TÝR, the Scandinavian god of battle. He is not a prominent figure in Northern mythology, for even in this special capacity he is overshadowed by Odin, and there are hardly any traces of worship being paid to him. Among other Teutonic peoples, however, he seems at one time to have been a deity of considerable importance. In Anglo-Saxon he was called Tī (*Ti, Tiig*, gen. *Tīwes*, whence "Tuesday") and equated with the Roman Mars. He is also identified with the German god mentioned more than once by Tacitus, as well as in inscriptions, by the name Mars. His Teutonic name is the same as the word for "god" in several other Indo-European languages (*e.g.* Lat. *dīuus*, Lith. *dēvas*, Skr. *devas*), and even in Old Norse the plural (*tīvar*) was still used in the same sense. (See TEUTONIC PEOPLES: § *Religion, ad fin.*) (H. M. C.)

TYRANT (Gr. τύραννος, master, ruler), a term applied in modern times to a ruler of a cruel and oppressive character. This use is, however, based on a complete misapprehension of the application of the Greek word, which implied nothing more than unconditional sovereignty. Such rulers are not, as is often supposed, confined to a single period, the 7th and 6th centuries B.C. (the so-called "Age of the Tyrants") of Greek history, but appear sporadically at all times, and are frequent in the later city-states of the Greek world. The use of the term "tyrant" in the bad sense is due largely to the ultra-constitutionalists of the 4th century in Athens, to whom the democracy of Pericles was the ideal of government. Thus the government which Lysander set up in Athens at the close of the Peloponnesian War is called that of the "Thirty Tyrants" (see CRITIAS). The same term is applied to those Roman generals (really 18) who usurped authority locally under Gallienus.

TYRAS, a colony of Miletus, probably founded about 600 B.C., situated some 10 m. from the mouth of the Tyras River (Dniester). Of no great importance in early times, in the 2nd century B.C. it fell under the dominion of native kings whose names appear on its coins, and it was destroyed by the Getae about 50 B.C. In A.D. 56 it seems to have been restored by the Romans and henceforth formed part of the province of Lower Moesia. There exists a series of its coins with heads of emperors from Domitian to Alexander Severus. Soon after the time of the latter it was destroyed by the Goths. Its government was in the hands of five archons, a senate, a popular assembly and a registrar. The types of its coins suggest a trade in wheat, wine and fish. The few inscriptions are also mostly concerned with trade. Its remains are scanty, as its site has been covered by the great medieval fortress of Monocastro or Akkerman (*q.v.*).

TYRCONNELL, RICHARD TALBOT, EARL [TITULAR DUKE] OF (1630–1691), Irish Jacobite, came of an ancient Anglo-Norman family, the Talbots of Malahide. His father, Sir William Talbot (d. 1633), was a Roman Catholic lawyer and politician of note. His brother Peter was Roman Catholic archbishop of Dublin. Richard Talbot served as a royalist during the Great Rebellion. He was present in Drogheda (Tredah) when it was stormed by Cromwell on the 3rd of September 1647, and was one of the few members of the garrison who escaped from the massacre; he fled to Spain. He then lived like many other royalist refugees, partly by casual military service, but also by acting as a subordinate agent in plots to upset the Commonwealth and murder Cromwell. He was arrested in London in November 1655 and was examined by Cromwell. Once more he escaped, but it was said by his enemies that he was bribed by the Protector, with whom one of his brothers was certainly in correspondence. After the Restoration he had a place in the household of the duke of York (James II.). He was actively engaged in an infamous intrigue to ruin the character of Anne Hyde, the duke's wife, but continued in James's employment and saw some service at sea in the naval wars with the Dutch. He accumulated money by acting as agent for Irish Roman Catholics who sought to recover their confiscated property. He was arrested in connexion with the Popish Plot agitation in 1678, but was allowed to go into exile. He returned just before the death of Charles II., and during the reign of James II. he was the chief agent of the king's policy in Ireland. He was appointed commander-in-chief and created earl of Tyrconnell in 1685. The duty assigned him was to create a Roman Catholic army which might be used to coerce England. In February 1687 he was appointed lord deputy, and became the civil as well as the military governor of Ireland. Tyrconnell, who foresaw the revolution in England, entered into intrigues for handing Ireland over to the king of France in order to secure the interest of his fellow Roman Catholics. For a time he made a pretence of protecting the Protestants, but when the revolution of 1688 occurred in England he threw himself, after some hesitation, into the struggle against William III., and when James fled to France Tyrconnell was left as his representative. When William raised the siege of Limerick, Tyrconnell went over to France to seek help, and after his return (January 1691) he was little more than a spectator of the military operations. When he did act it was to thwart the French General St Ruth and his own countryman Sarsfield. He became so unpopular that he was compelled to retire to Limerick, where he died of apoplexy on the 14th of August 1691. In 1689 King James created him duke of Tyrconnell, but the title was recognized only by the Jacobites.

TYRCONNELL (*Tir-Conaill*), an ancient kingdom of Ireland. Conall Gulban, a son of Niall of the Nine Hostages, king of Ireland, acquired the wild territory in the north-west of Ulster (the modern Co. Donegal, &c.), and founded the kingdom about the middle of the 5th century. Of the several branches of his family, the O'Connells, O'Cannanans and O'Dohertys may be mentioned. The kings of Tyrconnell maintained their position until 1071.

TYRE (Phoen. and Hebr. צר, צור = "rock," Assyr. *Ṣurru*, Egypt. *Dara*, Early Lat. *Sarra*), the most famous city of Phoenicia. It is now represented by the petty town of Sur (about 5,000 inhabitants), built round the harbour at the north end of a peninsula, which till the time of Alexander's siege was an island, without water or vegetation. The mole which he constructed has been widened by deposits of sand, so that the ancient island is now connected with the mainland by a tongue of land a quarter of a mile broad. The greatest length of the former island, from north to south, is about ⅝ m. and its area about 142 acres. The researches of Renan have refuted the once popular idea that a great part of the original island has disappeared by natural convulsions, though he believes that the remains of a submerged wall at the south end indicate that about 15 additional acres were once reclaimed and have been again lost. On this narrow site Tyre was built; its 25,000 inhabitants were crowded into many-storeyed houses loftier than those of Rome; and yet place was found not only for the great temple of Melqarth with its courts, but for docks and warehouses, and for the purple factories, which in Roman times made the town an unpleasant place of residence (Strabo xvi. 2, 23). In the Roman period the population occupied a strip of the opposite mainland, including Palaetyrus. Pliny (*Nat. Hist.* v. 19) gives to the whole city, continental and insular, a compass of 19 Roman miles; but this account must be received with caution. In Strabo's time the island was still the city, and Palaetyrus on the mainland was distant 30 stadia; modern research, however, indicates an extensive line of suburbs rather than one mainland city that can be identified with Palaetyrus. This name was given by the Greeks to the settlement on the coast under the mistaken impression that it was more ancient than that on the island; the Assyr. *Ushu*, frequently mentioned in the Amarna letters, makes it probable that Usu or Uzu was the native name. Owing to the paucity of Phoenician remains the topography of the town and its surroundings is still obscure. The present harbour is certainly the Sidonian port, though it is not so large as it once was; the other ancient harbour, the Egyptian port, has disappeared, and is supposed by Renan to have lain on the south side of the island, and to be now absorbed in the isthmus. The most important ruins are those of the cathedral, with its magnificent columns of rose-coloured granite, now prostrate. The present building is assigned by De Vogüé to the second half of the 12th century, but the columns may have belonged to the 4th-century church of Paulinus (Euseb. *H.E.* x. 4). The water-supply of ancient Tyre came from the powerful springs of Ras-al 'Ain (see AQUEDUCT) on the mainland, one hour south of the city, where there are still remarkable reservoirs, in connexion with which curious survivals of Adonis worship have been observed by travellers. Tyre was still an important city and an almost impregnable fortress under the Arab Empire. From 1124 to 1291 it was a stronghold of the crusaders, and Saladin himself besieged it in vain. After the fall of Acre the Christians deserted the place, which was then destroyed by the Moslems. The present town has arisen since the Motāwila (Metāwila or Mutāwileh) occupied the district in 1766.

The most important references to Tyre in the Bible are 1 Kings v., vii., ix.; Is. xxiii.; Am. i. 9 seq.; Ezek. xxvi.–xxviii.; 2 Macc. iv. 18 sqq.; Mark iii. 8, vii. 24 sqq.; Matt. xi. 21 seq. (and parallels); Acts xii. 20. Cf. also Joshua xix. 29; 2 Sam. xxiv. 7; Ezra iii. 7; Neh. xiii. 16; Ps. xlv. 12, lxxxiii. 7, lxxxvii. 4. For the history of Tyre see PHOENICIA. See also Renan, *Mission de Phénicie* (1864); Pietschmann, *Gesch. der Phönizier* (1889), 61–72; F. Jeremias, *Tyrus bis zur Zeit Nebukadnesars* (1891); H. Winckler, *Altor. Forschungen*, ii. 65 sqq.; A. Socin in Baedeker, *Pal. u. Syrien.*
(W. R. S.; G. A. C.*)

TYREE, an island of the Inner Hebrides, Argyllshire, Scotland. Pop. (1901), 2192. It is situated fully 2 m. S.W. of Coll, the isle of Gunna lying in the channel between the two islands, and has an extreme length from north-east to south-west of nearly 12 m. and a breadth varying from ¾ m. to 4¼ m. Carnan Mor (460 ft.) is the highest point; there are several lakes. On the south-western point of Balephuill Bay are ruins of St Patrick's temple, besides duns and ancient chapels. Steamers call from Oban regularly at the small harbour of Scarinish. SKERRYVORE, a lonely rock in the Atlantic, 14 m. south-west, belongs to the parish of Tyree. The massive lighthouse, which Alan Stevenson erected in 1833–1843, was constructed of granite from the quarries of Hynish at the south-eastern extremity of Tyree.

TYRONE, EARLS OF. The earldom of Tyrone was first conferred by Henry VIII. in 1542 on Conn Bacach O'Neill, and was forfeited in 1614 when an act of attainder was passed against his grandson Hugh, 2nd earl (more strictly 3rd earl, for his brother Brien was for some years *de jure* holder of the title though never recognized as such), the famous rebel who fled from Ireland with the earl of Tyrconnell in 1607 (see O'NEILL). Descendants of the 1st earl in Spain continued to style themselves earls of Tyrone till the death early in the 18th century of Owen O'Neill, grandson of Owen Roe O'Neill. In 1673 Richard Power, 6th Baron Le Power and Coroghmore, governor of Waterford, was created viscount of Decies and earl of Tyrone, being succeeded in these titles by his two sons successively, on the death of the younger of whom in 1704 they became extinct. A daughter of this last earl married Sir Marcus Beresford, Bart., of Coleraine, Co. Derry, in 1717; and in 1720 Beresford was created Baron Beresford and Viscount of Tyrone. In 1746 he was further created earl of Tyrone, and after his death in 1763 his widow became in 1767 Baroness La Poer in her own right. The only surviving son of this marriage inherited the titles of both his parents, all of which were in the peerage of Ireland, and in 1786 he was created a peer of Great Britain as Baron Tyrone of Haverfordwest in the county of Pembroke; three years later he was created marquess of Waterford, with which dignity the earldom of Tyrone has remained conjoined.

TYRONE, a county of Ireland in the province of Ulster, bounded N. and W. by Donegal, N.E. by Londonderry, E. by Lough Neagh and Armagh and S. by Monaghan and Fermanagh. The area is 806,658 acres or about 1260 sq. m. The surface is for the most part hilly, rising into mountains towards the north and south, but eastward towards Lough Neagh it declines into a level plain. Running along the north-eastern boundary with Londonderry are the ridges of the Sperrin Mountains (Sawel, 2240 ft., and Meenard, 2061 ft.). Farther south there is a range of lower hills, and Mullaghearn, north-east of Omagh, reaches 1778 ft. South of Clogher a range of hills, reaching 1255 ft. in Slieve Beagh, forms the boundary between Tyrone and Monaghan. On each side of the Mourne River near Omagh rise the two picturesque hills Bessy Bell and Mary Gray. The Foyle forms a small portion of the western boundary of the county, and receives the Mourne, which flows northward by Newton Stewart. The principal tributaries of the Mourne are the Strule (constituting its upper waters), the Derg from

Lough Derg, and the Owenkillew, flowing westward from Fir Mountain. The Blackwater rises near Fivemiletown and forms part of the south-eastern boundary of the county with Monaghan and Armagh. With the exception of Lough Neagh, bounding the county on the east, the lakes are small, also few in number. Lough Fea is picturesquely situated in the north-west, and there are several small lakes near Newtown Stewart.

Geology.—The Sperrin Mountains in the north consist of ordinary "Dalradian" mica schists, covered mostly with grass. Lower Carboniferous Sandstone occurs as an outlier between the mountains and Strabane. The relation of the northern schists to the gneissic and "green rock" axis that forms the central moorland of Tyrone is obscure; intrusions of granite have evidently coarsened the structure of this axis. Ancient perlitic rhyolites occur among the "green rocks" on its northern flank. Omagh lies on Lower Carboniferous Sandstone, which, fringed by Old Red Sandstone, stretches west from the town to the county boundary; but the Dalradian schists appear continuously south of this from Omagh to Lack in Co. Fermanagh. A great mass of Old Red Sandstone, rising in long ranges of hills, occupies most of the south of the county, resting on Silurian shales at Pomeroy. Lower Carboniferous sandstone and limestone occur on the south flank of this upland, and extend over its east end to Cookstown. At Slieve Beagh in the extreme south Upper Carboniferous sandstones and shales are reached, and from Coalisland to Dungannon true Coal Measures appear. This coalfield includes one fine seam 9 ft. thick at Coalisland; less important coals occur in the Millstone Grit series at Dungannon. Though much denuded before Triassic times, the field doubtless continues eastward under the Triassic sandstone that stretches towards Lough Neagh. The pale clays, probably Pliocene, of the southern shore of the lake cover the flat land east of Coalisland, and are several hundred feet thick. North of Stewartstown, near Tullaghoge, a very small patch of Magnesian limestone contains Permian marine fossils; and, farther north, the county includes part of the basaltic plateaus, protecting Chalk, which extend away into Co. Londonderry. The Glacial epoch has left immense deposits of gravel and long eskers throughout the county. These are especially conspicuous north of Pomeroy. Fire-clay is raised from the collieries at Coalisland; but coal-mining here awaits exploration on the east.

Industries.—The hilly districts are unsuitable for tillage; but in the lower regions the soil is remarkably fertile, and agriculture is generally practised after improved methods, the county in this respect being in advance of most parts of Ireland. The excellent pasturage of the hilly districts supports a large number of young cattle. The proportion of tillage to pasture is roughly as 1 to 1½. Oats, potatoes and turnips are the principal crops. The cultivation of flax, formerly an important industry, has greatly deteriorated. Poultry-keeping is a growing industry. There are manufactures of linens and coarse woollens (including blankets); brown earthenware, chemicals, whisky, soap and candles are also made. There are a few breweries and distilleries, and several flour and meal mills. But for the lack of enterprise the coal and iron might aid in the development of a considerable manufacturing industry.

Branches of the Great Northern railway from Portadown (Co. Armagh) and Dungannon in the south-east, and from Enniskillen (Co. Fermanagh) and Fintona, unite at Omagh, whence a line proceeds north by Newtown Stewart and Strabane to Londonderry. From Dungannon a branch runs north to Cookstown, where it joins a branch of the Northern Counties (Midland) railway. From Victoria Bridge on the Londonderry line the Castlederg light railway serves that town. The south of the county is served by the Clogher Valley light railway. Water communication includes Lough Neagh, and the Blackwater entering it, and navigable to Moy, whence the Ulster canal skirts the boundary of the county with Co. Armagh to Caledon. The Foyle is navigable to Strabane.

Population.—The population (150,567 in 1901) shows a decrease among the most serious of Irish county populations, and emigration is heavy. About 55% of the inhabitants are Roman Catholics, 22% Protestant Episcopalians and 19% Presbyterians; about 90% constitute the rural population. The chief towns are Strabane (pop. 5033), Omagh (the county town, 4789), Dungannon (3694), Cookstown (3531) and Newtown Stewart (1062). The county comprises 8 baronies. Two county members and 2 for each of the boroughs of Augher, Clogher, Dungannon and Strabane were returned to the Irish parliament; after the Union the county returned 2 members to parliament, the borough of Dungannon also returning 1; but in 1885 Dungannon was disfranchised and the county arranged in four divisions—east, mid, north and south—each returning one member. Assizes are held at Omagh and quarter-sessions at Clogher, Cookstown, Dungannon, Omagh and Strabane.

History.—Tyrone became a principality of one of the sons of Niall of the Nine Hostages in the 5th century, and from his name—Eogan—was called Tir Eogan, gradually altered to Tyrone. From Eogan were descended the O'Neals or O'Neills and their numerous septs. The family had their chief seat at Dungannon until the reign of Elizabeth, when it was burned by Hugh O'Neill to prevent it falling into the hands of Lord Mountjoy. The earldom of Tyrone had been conferred by Henry VIII. on Conn O'Neill, but on his death, when the earldom should have descended to his heir Matthew, baron of Dungannon, another son, Shane, was proclaimed chief with the consent of the people. Shane maintained a contest with English authority, but his last-remaining forces were completely defeated near the river Foyle in May 1567, and shortly afterwards he was himself killed. Tyrone was one of the counties formed at Sir John Perrot's shiring of the unreformed parts of Ulster; but his work was interrupted by the rising of Hugh O'Neill in 1596. During the insurrection of 1641 Charlemont Fort and Dungannon were captured by Sir Phelim O'Neill, and in 1645 the parliamentary forces under General Munro were signally defeated by Owen Roe O'Neill at Benburb. At the Revolution the county was for a long time in the possession of the forces of James II.

Raths are scattered over every district of the county. There is a large cromlech near Newtown Stewart, another at Tarnlaght near Coagh and another a mile above Castlederg. At Kilmeillie near Dungannon are two stone circles. There are some ruins of the ancient castle of the O'Neills, near Benburb; mention may also be made of the ruins of the castles of Newtown Stewart, Dungannon, Strabane and Ballygawley.

TYRONE, a borough of Blair county, Pennsylvania, U.S.A., about 15 m. N.E. of Altoona, on the Little Juniata river, a small tributary of the Juniata river. Pop. (1910) 7176. Tyrone is served by the main line and three short branches of the Pennsylvania railway (which has repair shops here), and is connected with Altoona by an electric line. The borough is situated about 910 ft. above sea-level, in an agricultural and lumbering region, and there are deposits of limestone in the vicinity. It is a distributing point for the Clearfield coal region to the northward. At the village of Birmingham, 3 m. east, is a school for girls (founded 1853; incorporated 1907). Tyrone was laid out as a village in 1851, and was incorporated as a borough in 1857.

TYRRELL, GEORGE (1861–1909), Irish divine, was born in Dublin on the 6th of February 1861, and came of a family noted for its intellectual distinction. He was educated under Dr Benson at Rathmines School and entered Trinity College in 1878. He was greatly influenced by the writings of Cardinal Newman, and early in 1879 entered the Roman Catholic Church. In 1880 he joined the Society of Jesus and passed his novitiate at Manresa and other houses of the order, becoming teacher of philosophy at Stonyhurst. He had a keen sympathy with the difficulties experienced by the ordinary lay mind in trying to reconcile the conservative element in Catholicism with the principle of development and growth, and in *The Faith of the Millions*, *Hard Sayings* and *Nova et vetera* he attempted to clear them away. His writings have been described as "apologetic in intention, meditative in method and mystical in substance," and Tyrrell himself certainly combined in a wonderful way the judicial and the enthusiastic types of character. Besides the influence of Newman, the friendship and work of Robert Dolling made a great impression on him, and as he admitted, saved him from being contented with a merely academic and ecclesiastical type of religion. Tyrrell privately circulated among his friends writings in which he drew a clear line of distinction between religion as a life and theology as the incomplete interpretation of that life. One of these, the *Letter to a Professor of Anthropology*, was translated without his knowledge into Italian, and extracts from it were published in the *Corriere della Sera* of Milan in January 1906. For at least eight years before this he had been more or less in conflict with the authorities of his order, through his sympathy with "modernist" views, but the publication of this letter (afterwards issued by Tyrrell as *A Much Abused Letter*) brought about his expulsion from the order in February 1906. "The conflict," he wrote, "such as it is, is one of opinion and tendencies, not of persons; it is the result of mental and moral necessities created by the antitheses with which the Church is wrestling in this period of transition." Tyrrell found no bishop to give him an ecclesiastical status and a *celebret*, and he never regained these privileges. In July 1907 the Holy Office published its decree condemning certain modernist propositions, and in September the pope issued his encyclical *Pascendi Gregis*. Tyrrell's criticism of this document appeared in *The Times* on the 30th of September and the 1st of October, and led to his virtual excommunication from the Church. In the few years that remained to him he gave himself with patience and dignity to the work of his life. He had already published *Lex orandi*, insisting that the true interpretation of the creed is determined by its prayer value, and in 1906 he wrote *Lex credendi*. This was followed by *Through Scylla and Charybdis*, in which he developed his favourite view of revelation as experience; *Mediaevalism*, a vigorous apologia in reply to a Lenten pastoral of Cardinal Mercier, archbishop of Malines, who had attacked him as the chief exponent of Modernism; and *Christianity at the Cross Roads*, which emphasizes the distinction between his own position and that of the Liberal Protestants, and is of special interest for its treatment of the eschatological problems of the Gospels. On the 6th of July 1909 he was suddenly taken ill, on the 10th he received conditional absolution from a priest of the diocese of Southwark, and on the 12th extreme unction from the prior of Storrington. His intimate friend, the Abbé Bremond, gave him the last absolution and remained with him until his death on the 15th of July 1909. Such appear to be the facts, but Tyrrell's relations with Rome were such that a good deal of mystery was made as to whether he really received the last rites of his Church in any authorized manner. About his own saintly and sympathetic character, and his essential religiousness, there was no doubt.

See the estimates by Baron F. von Hügel and Rev. C. E. Osborne in *The Hibbert Journal* for January 1910; also the obituary in *The Times* (July 16, 1909), and the *Life*, by Miss M. D. Petre.

TYRRELL, SIR JAMES (d. 1502), the supposed murderer of the English king Edward V., and of his brother Richard, duke of York, was a son of William Tyrrell and a grandson of Sir John Tyrrell (d. *c.* 1437), who was treasurer of the royal household and was on three occasions Speaker of the House of Commons. The family is said to descend from Walter Tirel, the murderer of William Rufus. During the Wars of the Roses James Tyrrell fought for the Yorkists; in 1471 he was knighted; and in 1477 he was member of parliament for Cornwall. With regard to his share in the murder of the prince in 1483 he appears to have been selected by Richard III. and sent to the Tower of London, where he supervised the crime which was carried out by his subordinates. Afterwards he received several appointments from Richard and was sent to Flanders. He was also employed by Henry VII. and was made governor of Guisnes, but he seems to have incurred the king's displeasure through his friendship with Edmund de la Pole, earl of Suffolk. Having been treacherously seized he was conveyed to England and was executed on the 6th of May 1502. Just before his death he made a confession about the murder of the princes.

Members of the same family were Sir Thomas Tyrrell (1594–1672), justice of the common pleas under Charles II., and Anthony Tyrrell (1552–*c.* 1610), a Roman Catholic priest and spy, who afterwards became a clergyman of the Church of England.

TYRTAEUS, Greek elegiac poet, lived at Sparta about the middle of the 7th century B.C. According to the older tradition he was a native of the Attic deme of Aphidnae, and was invited to Sparta at the suggestion of the Delphic oracle to assist the Spartans in the second Messenian war. According to a later version, he was a lame schoolmaster, sent by the Athenians as likely to be of the least assistance to the Spartans (Justin iii. 5; Themistius, *Orat.* xv. 242; Diod. Sic. xv. 67). A fanciful explanation of his lameness is that it alludes to the elegiac couplet, one verse of which is shorter than the other. According to Plato (*Laws*, p. 629 A), the citizenship of Sparta was conferred upon Tyrtaeus, although Herodotus (ix. 35) makes no mention of him among the foreigners so honoured. Basing his inference on the ground that Tyrtaeus speaks of himself as a citizen of Sparta (*Fr.* 2), Strabo (viii. 362) is inclined to reject the story of his Athenian origin. Suïdas speaks of him as "Laconian or Milesian"; possibly he visited Miletus in his youth, where he became familiar with the Ionic elegy. Busolt, who suggests that Tyrtaeus was a native of Aphidnae in Laconia, conjectures that the entire legend may have been concocted in connexion with the expedition sent to the assistance of Sparta in her struggle with the revolted Helots at Ithome (464). However this may be, it is generally admitted that Tyrtaeus flourished during the second Messenian war (*c.* 650 B.C.)—a period of remarkable musical and poetical activity at Sparta, when poets like Terpander and Thaletas were welcomed—that he not only wrote poetry but served in the field, and that he endeavoured to compose the internal dissensions of Sparta (Aristotle, *Politics*, v. 6) by inspiring the citizens with a patriotic love for their fatherland. About twelve fragments (three of them complete poems) are preserved in Strabo, Lycurgus, Stobaeus and others. They are mainly elegiac and in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus (Εὐνομία), partly to stimulate the Spartan soldiers to deeds of heroism in the field (Ὑποθῆκαι—the title is, however, later than Tyrtaeus). The interest of the fragments preserved from the Εὐνομία is mainly historical, and connected with the first Messenian war. The Ὑποθῆκαι, which are of considerable merit, contain exhortations to bravery and a warning against the disgrace of cowardice. The popularity of these elegies in the Spartan army was such that, according to Athenaeus (xiv. 630 F), it became the custom for the soldiers to sing them round the camp fires at night, the polemarch rewarding the best singer with a piece of flesh. Of the marching songs (Ἐμβατήρια), written in the anapaestic measure and the Doric dialect, only scanty fragments remain (Lycurgus, *In Leocratem*, p. 211, § 107; Pausanias iv. 14, 5. 15, 2; fragments in T. Bergk, *Poetae lyrici graeci*, ii.).

Verrall (*Classical Review*, July 1896, May 1897) definitely places the lifetime of Tyrtaeus in the middle of the 5th century B.C., while Schwartz (*Hermes*, 1899, xxxiv.) disputes the existence of the poet altogether; see also Macan in *Classical Review* (February 1897); H. Weil, *Études sur l'antiquité grecque* (1900), and C. Giarratani, *Tirteo e i suoi carmi* (1905). There are English verse translations by R. Polwhele (1792) and imitations by H. J. Pye, poet laureate (1795), and an Italian version by F. Cavallotti, with text, introduction and notes (1898). The fragment beginning Τεθναμέναι γὰρ καλὸν has been translated by Thomas Campbell, the poet. The edition by C. A. Klotz (1827) contains a dissertation on the war-songs of different countries.

TYRWHITT, THOMAS (1730–1786), English classical scholar and critic, was born in London on the 27th of March 1730, where he died on the 15th of August 1786. He was educated at Eton and Queen's College, Oxford (fellow of Merton, 1755). In 1756 he was appointed under-secretary at war, in 1762 clerk of the House of Commons. In 1768 he resigned his post, and spent the remainder of his life in learned retirement. In 1784 he was elected a trustee of the British Museum, to which he bequeathed a portion of his valuable library.

His principal classical works are: *Fragmenta Plutarchi II. inedita* (1773), from a Harleian MS.; *Dissertatio de Babrio* (1776), containing some fables of Aesop, hitherto unedited, from a Bodleian MS.; the pseudo-Orphic *De lapidibus* (1781), which he assigned to the age of Constantius; *Conjecturae in Strabonem* (1783); Isaeus *De Meneclis hereditate* (1785); Aristotle's *Poetica*, his most important work, published after his death under the superintendence of Dr Burgess, bishop of Salisbury, in 1794. Special mention is due of his editions of Chaucer's *Canterbury Tales* (1775–1778); and of *Poems, supposed to have been written at Bristol by Thomas Rowley* *and others in the Fifteenth Century* (1777–1778), with an appendix to prove that the poems were all the work of Chatterton. In 1782 he published a *Vindication of the Appendix* in reply to the arguments of those who maintained the genuineness of the poems. While clerk of the House of Commons he edited *Proceedings and Debates of the House of Commons*, 1620–1621 from the original MS. in the library of Queen's College, Oxford, and Henry Elsynge's (1598–1654) *The Manner of holding Parliaments in England.*

TYTLER, WILLIAM (1711–1792), of Woodhouselee, Scottish historian and antiquarian, son of Alexander Tytler of Edinburgh, was born in that city on the 12th of October 1711. He was educated at the High School and the University, and was in 1744 admitted into the society of Writers to the Signet. In 1759 he published an *Inquiry, Historical and Critical*, defending the character of Mary, Queen of Scots, and in 1783 the *Poetical Remains of James the First, King of Scotland.* He died at Woodhouselee on the 12th of September 1792. His life, written by Henry Mackenzie, was published in 1796.

His son Alexander Fraser Tytler, Lord Woodhouselee (1747–1813), Scottish judge, was born at Edinburgh on the 15th of October 1747. He was called to the Edinburgh bar in 1770. His first work, a supplement to Lord Kames's *Dictionary of Decisions*, entitled *The Decisions of the Court of Session*, was published in 1778, and a continuation appeared in 1796. In 1780 he was appointed conjoint professor of universal history in the university of Edinburgh, becoming sole professor in 1786. In 1783 he published *Outlines* of his course of lectures, extended and republished in 1801 under the title of *Elements of General History.* In 1790 he was appointed judge-advocate of Scotland, and while holding this office he wrote a *Treatise on the Law of Courts-Martial.* In 1801 he was raised to the bench, taking his seat (1802) in the court of session as Lord Woodhouselee. He died at Edinburgh on the 5th of January 1813.

Besides the works already mentioned, he wrote *Life and Writings of Dr John Gregory* (1788); *Essay on the Principles of Translation* (1790); a dissertation on *Final Causes*, prefixed to his edition of Derham's *Physico-Theology* (1799); a political pamphlet entitled *Ireland profiting by Example* (1799); an *Essay* on Laura and Petrarch (1801); and *Memoirs of the Life and Writings of Henry Home of Kames* (1807).

Patrick Fraser Tytler (1791–1849) Scottish historian, son of Lord Woodhouselee, was born at Edinburgh on the 30th of August 1791. He was called to the bar in 1813; in 1816 he became king's counsel in the exchequer, and practised as an advocate until 1832. He contributed to Allison's *Travels in France* (1815); his first independent essays were papers in *Blackwood's Magazine.* His great work, the *History of Scotland* (1828–1843) covered the period between 1249 and 1603. While occupied on this work Tytler removed to London, and it was largely owing to his efforts that a scheme for publishing state papers was carried out. Tytler was one of the founders of the Bannatyne Club and of the English Historical Society. He died at Great Malvern on the 14th of December 1849. His life (1859) was written by his friend, John W. Burgon, dean of Chichester.

His other works include: contributions to Thomson's *Select Melodies of Scotland* (1824); *Life of James Crichton of Cluny, commonly called the Admirable Crichton* (1819; 2nd ed., 1823); a *Memoir of Sir Thomas Craig of Riccarton* (1823); an *Essay on the Revival of Greek Literature in Italy*, and a *Life of John Wickliff*, published anonymously (1826); *Lives of Scottish Worthies*, for Murray's *Family Library* (1831–1833); *Historical View of the Progress of Discovery in America* (1832); *Life of Sir Walter Raleigh* (1833); *Life of Henry VIII.* (1837); *England under the Reigns of Edward VI. and Mary*, from original letters (1839); *Notes on the Darnley Jewel* (1843), and on the *Portraits of Mary Queen of Scots* (1845).

TYUMEÑ, a town in West Siberia, in the government of Tobolsk, situated where the chief highway from Russia across the Urals touches the first navigable river (the Tura) of Siberia. Pop. (1900), 29,651. A railway passing through Ekaterinburg (202 m. west by rail) and the principal ironworks on the eastern slopes of the middle Urals connects Tyumeñ with Perm, the terminus of steamboat traffic on the Kama and Volga. Tyumeñ has regular steam communication with Omsk and Semipalatinsk Irtysh (steamers penetrating as far as Lake Zaisan in Dzungaria), with Tomsk, and other places in the Altai, and with the Arctic Ocean and the fisheries of the lower Ob. The town is well built, and stands on both banks of the Tura, here spanned by a bridge. The inhabitants have always been renowned for their industrial skill. Woollen cloth, linen, belts, barges, paper, and especially boots and gloves, are manufactured to a large amount; and Tyumeñ carpets have a great reputation in Russia and Siberia.

TZETZES, JOHN, Byzantine poet and grammarian, flourished at Constantinople during the 12th century A.D. Tzetzes has been described as a perfect specimen of the Byzantine pedant. Excessively vain, he resented any attempt at rivalry, and violently attacked his fellow grammarians. Owing to want of books, he was obliged to trust to his memory; hence he is to be used with caution. But he was a learned man, and deserves gratitude for his efforts to keep up the study of ancient Greek literature. Of his numerous works the most important is the *Book of Histories*, usually called *Chiliades* ("thousands") from the arbitrary division by its first editor (N. Gerbel, 1546) into books each containing 1000 lines (it actually consists of 12,674 lines in "political" verse). It is a collection of literary, historical, theological and antiquarian miscellanies, whose chief value consists in the fact that it to some extent makes up for the loss of works which were accessible to Tzetzes. The whole production suffers from an unnecessary display of learning, the total number of authors quoted being more than 400 (H. Spelthahn, *Studien zu den Chiliaden des Johannes Tzetzes*, diss., Munich, 1904). The author subsequently brought out a revised edition with marginal notes in prose and verse (ed. T. Kiessling, 1826; on the sources see C. Harder, *De J. T. historiarum fontibus quaestiones selectae*, diss., Kiel, 1886). The *Chiliades* is based upon a collection of *Letters* (ed. T. Pressel, 1851), which has been called an index to the larger work, itself described as a versified commentary on the letters. These letters (107 in number) are addressed partly to fictitious personages, and partly to the great men and women of the writer's time. They contain a considerable amount of biographical details. The *Iliaca*, an abridgment of and supplement to the *Iliad*, is divided into three parts—*Antehomerica, Homerica, Posthomerica*—containing the narrative from the birth of Paris to the return of the Greeks after the fall of Troy, in 1676 hexameters (ed. C. Lehrs and F. Dübner, 1868, in the Didot series, with Hesiod, &c.) The Homeric *Allegories*, dedicated to the empress Irene, in "political" verse, are two didactic poems in which Homer and the Homeric theology are explained on euphemistic principles (ed. P. Matranga, in his *Anecdota graeca*, i. 1850). Tzetzes also wrote commentaries on a number of Greek authors, the most important of which is that on the *Cassandra* or *Alexandra* of Lycophron (ed. C. G. Müller, 1811), in the production of which his brother Isaac is generally associated with him. Mention may also be made of a dramatic sketch in iambic verse, in which the caprices of fortune and the wretched lot of the learned are described; and of an iambic poem on the death of the emperor Manuel, noticeable for introducing at the beginning of each line the last word of the line preceding it[1] (both in Matranga, *An. gr.* ii.).

For the other works of Tzetzes see J. A. Fabricius, *Bibliotheca graeca* (ed. Harles), xi. 228, and C. Krumbacher, *Geschichte der byz. Litt.* (2nd ed., 1897); monograph by G. Hart, "De Tzetzarum nomine, vitis, scriptis," in Jahn's *Jahrbücher für classische Philologie.* Supplementband xii. (Leipzig, 1881).

[1] This versification is called κλιμακωτός (κλῖμαξ, ladder), a term more commonly applied to a verse in which each word contains one letter more than the one which precedes it.

U The twenty-first letter of the English alphabet. It is a modification made in manuscript writing of the Latin inscriptional V, and is itself found on the inscriptions of Rome as early as the latter part of the 2nd century A.D. The symbols U, V, Y are all of the same origin, but what the origin is has been much disputed. In the Phoenician alphabet T is the last symbol, but there can be little doubt that when the Greeks introduced symbols for vowels, which had not been indicated in the alphabet they had borrowed, they took the sixth symbol of the Phoenician alphabet (see F) in its ordinary form ϒ and placed it at the end of the alphabet with the value of a vowel. This vowel was apparently *u* (English *oo* in *moon*), though Ionic and Attic Greek at a very early period changed it to the sound of the French *u*. In other dialects the earlier value long persisted, and in modern Tzakonian, the representative of the ancient Laconian, it still survives. In some places, *e.g.* Boeotia, the sound seems to have changed, in connexion with dental consonants, in the same way as the English sound, in certain cases *i̯* (*y*) being inserted in front of it. This seems to be the only feasible explanation of such spellings as τιούχα (τύχη), πολιούξενος (πολύξενος), which appear after the Boeotians adopted the Ionic alphabet. A similar change must have existed in very early Attic and Ionic to account for the change of *t* before *υ* into *s* in σύ, "thou" for τύ; some authorities think it was universal in the earliest Greek. Greek nowhere shows the symbol in the bowl shape that it has in the Semitic alphabet. From the 7th century B.C. both Y and V are found, sometimes both in the same area. Another form somewhat later has the upper strokes curved outwards ϒ, while the angle is much less deep than in the other forms. It is noticeable that the symbol for *u* in the syllabary which was used to write Greek in Cyprus has this form amongst others. The name of the sixth symbol in the Phoenician alphabet was *Wāw* (*Vau*), but though U has taken its form, in Greek its name was ῦ (*i.e.* English *oo*, as in moon, except in Attic and Ionic, where it was like the French *u* in *lune*), not *upsilon*, as is frequently stated. In Sweet's terminology *u* (*oo*), as pronounced in English "put" or "too," is a high back wide round, while the sound in the French *sou* or the Scotch pronunciation of "book" is a high back narrow round. The high front corresponding sound is found in the French *lune*. With this the German "modified u" (*ü*) is often equated, but it is not really identical, being a mid front narrow round vowel. The pitch of the vowel *u* is among the lowest of the vowel sounds; the rounding and protrusion of the lips make the breath passage longer than it is for other vowels, and so its production may be compared to that of a sound made upon a flute when all the finger-holes are covered. In modern English *ū* preceded by *i̯* (*y*) arises from three different sounds in middle English: (*a*) the long French *u* (*ü*) brought in with borrowed words from French (duke), (*b*) *ēu* (Early English *ēow*) as in "new," (*c*) a more open sound *ēu* (Early English *ēaw*) as in "dew" (Sweet, *New English Grammar*, § 806). The *y*-sound was dropped after *r*, *ch* and *dzh*, as in "true," "choose," "juice" (ibid., § 857). In the literary dialect also it generally disappears after *l*, as in "lurid," "lute." In some provincial and American pronunciations it is dropped everywhere except initially, so that "Tuesday" is pronounced *Toosday*, "new" *noo*. (P. Gi.)

UAKARI (*Ouakari*), the native name of certain tropical American monkeys, distinguished from all other New World monkeys by their short tails. The three known species constitute the genus *Uacaria* (or *Cothurus*) of zoologists, and are confined to the forests of Amazonia and the neighbourhood. One of them (*U. calva*) is remarkable for its long, silky, pale chestnut fur and brilliant scarlet face, which is naked (see PRIMATES).

UBANGI, a river of Equatorial Africa, the chief northern affluent of the Congo (*q.v.*). The Ubangi (otherwise Mubangi or Mobangi) enters the Congo by various mouths between 0° 22′ and 0° 37′ S. and 17° 40′ and 17° 50′ E. The main channel, fully 1 m. wide, joins the Congo in 0° 31′ S. The Ubangi is formed by the junction of the Mbomu and the Welle, both of which rise on the north-eastern rim of the Congo basin.

The water-parting between the Bahr-el-Ghazal affluents (Nile system) and the Mbomu headstreams is not very clearly marked, but high hills running parallel with the Nile between Albert Nyanza and Dufile sharply separate the valley of the Welle and other west-flowing streams from that of the Mountain Nile. The chief of the headstreams of the Welle (known in its upper course as the Kibali) rises on the western slope of a hill about 40 m. west of Wadelai. It is joined by several small streams, the main river flowing in a W.N.W. direction. After a course of over 700 m. (during which it receives one large southern tributary—the Bomokandi—and other considerable affluents) the Welle joins the Mbomu in 4° 10′ N. 22° 37′ E. The Mbomu, which has two large northern tributaries, the Shinko and the Balo, rises in 4° 50′ N. 27° 12′ E. For some distance it runs parallel to and about 100 m. north of the lower course of the Welle. About 23° 12′ E. it turns sharply south until its junction with the Welle. In its lower course the Mbomu is interrupted by many falls and rapids. A short distance below the junction of the Mbomu and Welle the Kotto, coming from beyond 8° N., on the borders of Darfur, and forming the most northerly extension of the Congo basin, enters the united stream, now known as the Ubangi, on the right bank. The remaining tributaries, mostly on the right bank, are smaller, but the Kemo, which joins the Ubangi near its most northern point (5° 8′ N.), is of some importance as offering water communication to within a short distance of the Shari basin. Below the Kemo confluence the Ubangi, which has hitherto continued to flow W.N.W., makes a great bend south and runs into the Congo after a southerly course of 400 m. Shortly after receiving the Kemo the river forces its way through a line of hills whose tops rise 600 to 800 ft. above the banks of the stream. Here are the Zongo or Grenfell rapids, which are a barrier to navigation save for small boats at flood season. Above the Zongo rapids the river is navigable up to the confluence of the Welle and Mbomu, and the Welle is navigable at high flood up to the Bomokandi confluence in 26° 8′, though the stream is much interrupted by rapids.

From the Mbomu-Welle confluence to the junction of the Ubangi with the Congo the river has a course of fully 700 m., while the Ubangi-Welle combined exceeds 1400 m. From its mouth to Zongo rapids, a distance of 350 m., the stream is navigable by steamers drawing 3 ft. of water. In general the Ubangi flows through a fertile and forested region.

The Welle was discovered from the north by G. A. Schweinfurth in 1870; *i.e.* seven years before the discovery of the course of the Congo by H. M. Stanley. By Schweinfurth the Welle was believed to belong to the Chad system, but W. Junker, who (1882–1883) followed the river to near its confluence with the Mbomu, made it clear that the Welle belonged to the Congo system. In 1885 the Rev. George Grenfell, of the Baptist Missionary Society (who had discovered the mouth of the river in 1884), ascended the Ubangi as far as the Zongo rapids. He was followed in 1886–1889 by the Belgian A. van Gèle, who in the last-named year finally established the identity of the Ubangi with Schweinfurth's Welle. The Mbomu was discovered from the north in 1877 by a Greek, Dr P. Potagos, and its upper course was followed for some distance by Junker. The Ubangi and the Mbomu form the frontier between Belgian Congo and French Congo, the northern banks of both streams belonging to France.

See, besides the works of Schweinfurth, Junker and other travellers, A. J. Wauters, *Les Bassins de l'Ubangi (inférieur) et de la Sanga*, with map (Brussels, 1902); Dr Cureau's map (1 : 1,000,000) of the upper Ubangi in *La Géographie* (October 1900); the CONGO and works there cited.

ÚBEDA, a town of southern Spain, in the province of Jaen; 2000 ft. above sea-level, in the Loma de Úbeda, a range on the right bank of the Guadalquivir. Pop. (1900), 19,913. The surrounding country produces wheat, wine, olives and fruit. Úbeda has a station 6 m. south on the Madrid-Almeria railway. Portions of the old walls, with towers and gates, still remain, and there are three late Gothic churches, the oldest of which, San Salvador, dates from 1540 to 1556, and contains some interesting paintings. An important fair is held from the 29th of September to the 5th of October. Oil, soap, esparto and linen fabrics are manufactured. Úbeda was an important town under Moorish rule.

UDAD, AOUDAD or AUDAD, the Moorish name of the Barbary sheep, or arui, *Ovis* (*Ammotragus*) *lervia*, the only wild sheep found in Africa, where it inhabits all the mountain ranges of the north, descending to the eastward far into the heart of the Sudan. The udad is distinguished by the abundant hair on the throat and fore-quarters of the rams, and the length of the tail. In the absence of face-glands and in the structure of the horns the species approximates to the goats. The "lion-coloured" coat approximates to the hue of the limestone rocks on which these sheep dwell.

UDAIPUR, OODEYPORE or MEWAR, a native state of India, in the Rajputana agency. Area, 12,691 sq. m. Pop. (1901), 1,030,212. Estimated revenue £200,000; tribute £17,000. The greater part of the country is level plain. A section of the Aravalli Mountains extends over the south-western and southern portions, and is rich in minerals, but the mines have been long closed. The general inclination of the country is from south-west to north-east, the Banas and its numerous feeders flowing from the base of the Aravalli range. There are many lakes and tanks in the state, the finest of which is the Debar or Jaisamand, with an area of nearly 21 sq. m.; it is considered to be the largest artificial sheet of water in the world. A portion of the state is traversed by the Malwa line of the Rajputana railway. A branch from Chitor towards Udaipur was taken over by the state in 1898, and was extended nearer to the capital. Like the rest of Rajputana the state suffered severely from famine in 1900. The ancient coinage is of the Sasanian or Persian type, copper issues of this type being still in circulation. Modern coins bear on the reverse the words "Friend of London."

The chief, whose title is maharana, is the head of the Sisodhyia clan of Rajputs, and claims to be the direct representative of Rama, the mythical king of Ajodhya. He is universally recognized as the highest in rank of all the Rajput princes. The dynasty offered a heroic resistance to the Mahommedans, and boast that they never gave a daughter to a Mogul emperor. They are said to have come from Gujarat and settled at Chitor in the 8th century. After the capture of Chitor by Akbar in 1568 the capital was removed to Udaipur by Maharana Udai Singh. During the 18th century the state suffered greatly from internal dissension and from the inroads of the Mahrattas. It came under British protection in 1817. The Maharana Fateh Singh, G.C.S.I. (b. 1848), succeeded by adoption in 1884.

The name of *Mewar* is derived from the Meos, or Minas, a tribe of mixed Rajput origin, who have likewise given their name to a different tract in northern Rajputana, called Mewat, where they are now all Mahommedans. About 1400 a sub-division of the Mewatis, called Khanzadas, made themselves the dominant power in this tract; and at the end of the 18th century, and again during the Mutiny, they were notorious for their ravages in the Upper Doab, around Agra and Delhi. In 1901 the total number of Mewatis in Rajputana was 168,596, forming 13% of the population in the state of Alwar. Down to 1906 the Mewar residency was the title of a political agency in Rajputana, comprising the four states of Udaipur, Banswara, Dungarpur and Partabgarh; area, 16,970 sq. m.; pop. (1901), 1,336,283. But in that year the three last states were separated from Udaipur, and formed into the Southern Rajputana States agency. The Mewar Bhil Corps, raised as a local battalion in 1840, which was conspicuously loyal during the Mutiny, was in 1897 attached to the Indian army, with its headquarters at Kherwara.

The city of UDAIPUR is 2469 ft. above sea-level. Pop. (1901), 45,976. It is situated in a valley amid wooded hills, on the bank of a large lake (Pichola), with palaces built of granite and marble. The maharana's palace, which crowns the ridge on which the city stands, dates originally from about 1570, but has had additions made to it till it has become a conglomeration of various architectural styles. On Lake Pichola are two islands, on which are palaces dating respectively from the middle of the 17th and of the 18th centuries. In one of these the European residents were sheltered during the Indian Mutiny. In the neighbourhood are Eklingji (with a magnificent temple of the 15th century), and Nagda, the seat of the ancestors of the chiefs of Udaipur, with a number of temples, two of which are said to date from the 11th century.

There is another UDAIPUR STATE in the Central Provinces (till 1905 one of the Chota Nagpur states of Bengal). Area, 1052 sq. m.; pop. (1901), 45,391. Its capital is Dharmjaygarh.

UDAL, NICHOLAS (1504–1556), English schoolmaster, translator and playwright, author of the earliest extant English comedy, *Roister Doister*, came of the family of Uvedale, who in the 14th century became lords of Wykeham, Hants, by marriage with the heiress of the Scures. The name was probably pronounced Oovedale, as it appears as Yevedale, Owdall, Woodall, with other variants. He latinized it as Udallus, and thence anglicized it as Udall. He is described as Owdall of the parish of St Cross, Southampton, 12 years old at Christmas 1516, when admitted a scholar of Winchester College in 1517 (*Win. Schol. Reg.*). He was therefore not 14 (as Anthony Wood says) but 16½ years of age when admitted a scholar of Corpus Christi College, Oxford, in June 1520; he is called Wodall as a lecturer at that college in 1526 to 1528 (T. Fowler, *Hist. C. C. C.*).

With John Leland he produced "dites" (ditties) "and interludes" (B.M. MS. 18A lxiv.) at Anne Boleyn's coronation on the 31st of May 1533. Leland's contributions are all in Latin; those of "Udallus," which form the chief part, are mostly in English, the speeches being each spoken by a "child," at Cornhill beside Leadenhall," "at the Conducte in Cornhill" and "at the little Conducte in Cheepe." His *Floures for Latine Spekynge, selected and gathered out of Terence and the same translated into Englysshe*, published by Bartlet (*in aedibus Bertheleti*), were dedicated "to my most sweet flock of pupils, from the monastery of the monks of the order of Augustine," on the 28th of February 1533–1534. There were no monks of that order, and whether Austin Friars or Augustinian canons were meant is open to doubt. The book was prefaced with laudatory Latin verses by Leland and by Edmund Jonson. The latter was a Winchester and Oxford contemporary of Udal's, in 1528 lower master (*hostiarius*) at Eton, a post which he left to become master of the school of St Anthony's Hospital, then the most flourishing school in London. From the dedication we may infer that Udal was usher under Jonson and "the sweet flock" was at St Anthony's school next door to Austin Friars. At Midsummer 1534 he became head master of Eton (*informator puerorum* or *ludi grammaticalis*; *Eton Audit Book*. 25–26 Hen. VIII.). It has been suggested (*Dic. Nat. Biog.*) that the *Floures* was dedicated to Eton boys in advance; but this is unlikely, as in those days schools never got their masters till the place was vacant, or on the verge of vacancy. At Eton Udal's salary was £10 and £1 for livery, with "petty receipts" of 8s. 4d. for *obits*, 2s. 8d. for laundress, 2s. for candles for his chamber, and 23s. 4d. "for ink, candles and other things given to the grammar school by Dr Lupton, provost." One of his school books, *Commentaries on the Tusculan questions of Cicero* (ed. Berouldus, 1509), with the inscription "sum Nicolai Udalli 1536," is in the King's Library at the British Museum.

There was a yearly play, 3s. being paid for the repair of the dresses of the players at Christmas, and 1s. 4d. to a servant of the dean of Windsor for bringing his master's clothes for the players. A payment for repair of the players' dresses recurs every year. Udal has been credited (E. K. Chambers, *Mediaeval Stage*, ii. 144, 192) with producing a play at Braintree while vicar there, recorded in the churchwardens' accounts for 1534 as "Placidas *alias* Sir Eustace." The play is actually called in the accounts (only extant in 17th-century extracts) "Placy Dacy *alias* St Ewastacy," and is the old play of Placidas, mentioned in the 9th century. Udal did not become vicar of Braintree till the 27th of September 1537 (Newcourt's *Repert.* ii. 89). At Michaelmas he resigned the mastership of Eton to reside at Braintree, being called "late schole-master wose roome nowe enjoyeth and occupieth Mr Tindall" in a letter from the provost to Thomas Cromwell, then privy seal, on the 7th October 1537 (*Lett. and Pa. Hen. VIII.*, 1537). He returned to Eton, however, or rather to Hedgeley, the school being removed there on account of the plague, at Midsummer 1537, being paid for the third and fourth terms of the school year

(*Eton Audit Book*, 29–30 Hen. VIII.). In October 1538 "Nicholas Uvedale, professor of the liberal arts, *informator* and schoolmaster of Eton," was licensed to hold the vicarage of Braintree, "with other benefices," without personal residence. The accounts of Cromwell for 1538 include "Woodall, the scholemaster of Eton, to playing before my lord, £5." Presumably he brought a troupe of Eton boys with him. In that year he published a second edition of his *Floures of Terence* for the benefit of Eton boys. The often-questioned account of Thomas Tusser (*Five Hundred Pointes of Good Husbandrie*) is typical of Eton at the time, as Udal's predecessor Cox is said in Ascham's *Scholemaster* to have been "the best scholemaster and greatest beater of our time":—

> "From Powles[1] I went to Aeton sent,
> To learn straightwaies the Latin phraise;
> Where fifty-three stripes given to me at once I had;
> For fault but small or none at all
> It came to pass thus beat I was;
> See, Udall, see, the mercie of thee to mee, poor lad."

Udal's rule of the rod at Eton was brought to an abrupt conclusion by his being brought up before the privy council on the 14th of March 1540/1541 for being "counsail" with two of the boys, Thomas Cheney, a relation of the lord treasurer of the household, and Thomas Hoorde, for stealing some silver images and chapel ornaments. He denied the theft, but confessed to a much more scandalous offence with Cheney, and was sent to the Marshalsea prison. He tried, but failed, to get restored to Eton. Attempts have been made to whitewash him. But his own confession, and an abject letter of repentance with promises of amendment, addressed (probably) to Wriothesley, a Hampshire man and a family friend, cannot be got over. It shows that he was a bad schoolmaster as well as an immoral one, since he pleads "myn honest chaunge from vice to vertue, from prodigalitee to frugall lyving, from negligence of teachyng to assiduitee, from play to studie, from lightness to gravitee." In 1542–1543, after the bursar of Eton had ridden up to London to the provost, Udal was paid "53s. 4d. in full satisfaction of his salary in arrears and other things due to him while he was teaching the children"; but on the other side of the account appears an item of "60s. received from Dr Coxe for Udal's debts." So no money passed to Udal.

He seems to have maintained himself by translating into English, in 1542, Erasmus's *Apophthegms* and other works. In 1544 he published a new edition of the *Floures of Terence.* He seems to have taken a schoolmastership in Northumberland or Durham, as Leland in one of his *Encomia* speaks of him, probably at this time, as translated to the Brigantes. He seems to have been made to resign his living at Braintree, a successor being appointed on the 14th of December 1544. He purged himself, however, by composing the *Answer to the Articles of the Commoners of Devonshire and Cornwall* (Pocock, *Troubles of the Prayer Book of 1549*, Camd. Soc., new series, 37, 141, 193), when they rose in rebellion in the summer of 1549 against the First Prayer Book of Edward VI. In 1551 he received a patent for printing his translation of Peter Martyr's two works on the Eucharist and the Great Bible in English (Pat. 4 Edw. VI. pt. 5, m. 5, Shakespeare Soc. iii. xxx.). He was rewarded by being made a canon of Windsor on the 14th of December 1551. On the 5th of January "after the common reckoning 1552" (*i.e.* 1551/2) he edited a translation of Erasmus's *Paraphrases* of the Gospels, himself translating the first three, while that on St John was being translated by the princess Mary, till she fell sick and handed her work over to Dr Malet. The work was done at the suggestion and expense of the dowager queen Katharine, in whose charge Mary was. A translation by Udal of Geminus's *Anatomie* or *Compendiosa totius anatomiae delineatio*, a huge volume with gruesome plates, was published in 1553." Udal's preface is dated the 20th of July 1552 "at Windesore. In June and September 1553 (*Trevelyan Pap.* Camd. Soc. 84, ii. 31, 33) "Mr Nicholas Uvedale" was paid at the rate of £13, 6s. 8d. a year as "scholemaster to Mr Edward Courtney, beinge within the Tower of London, by virtue of the King's Majesty's Warrant"—the young earl of Devon, who had been in prison ever since he was twelve years old.

[1] Tusser was a chorister of St Paul's.

Queen Mary on the 3rd of December 1554 issued a warrant on Udal's behalf reciting that he had "at soundrie seasons convenient heretofore shewed and myndeth hereafter to shewe his diligence in setting forth Dialogues and Enterludes before us for our royal disporte and recreacion," and directing "the maister and yeomen of the office of the Revells" to deliver whatever Udal should think necessary for setting forth such devices, while the exchequer was ordered to provide the money to buy them (Loseley MSS. Kempe 63, and *Hist. MSS. Com. Rep.* vii. 612). One of these interludes was probably *Roister Doister*; for it was in January 1553, *i.e.* 1554, that Thomas Wilson, master of St Katharine's Hospital by the Tower, produced the third edition of *The Rule of Reason*, the first text-book on logic written in English, which contains, while the two earlier editions, published in 1551 and 1552 respectively, do not contain, a long quotation from *Roister Doister.* It gives under the heading of "ambiguitie," as "an example of such doubtful writing whiche, by reason of poincting, maie have double sense and contrarie meaning . . . taken out of an intrelude made by Nicholas Udal," the letter which Ralph Roister procured a scrivener to compose for him, asking Christian Constance, the heroine, to marry him. Roister's emissary read it—

> "Sweete mistresse, where as I love you nothing at all,
> Regarding your substance and richnesse chiefe of all,"

and so on; whereas it was meant to read—

> "Sweete mistresse, whereas I love you (nothing at all
> Regarding your substance and richnesse) chiefe of all,
> For your personage, beautie, demeanour and wit."

The play was entered at Stationers' Hall, when printed in 1566. Only one copy is known, which was given to Eton by an old Etonian, the Rev. Th. Briggs, in 1818, who privately printed thirty copies of it. As the title-page is gone the only evidence of its authorship is Wilson's quotation. Wilson being an Etonian, it has been argued that his quotation was a reminiscence of his Eton days, and that the play was written for and first performed by Eton boys. But the occurrence of the quotation first in the edition of 1554, and its absence in the previous editions of 1551 and 1552, coupled with the absence of anything in the play to suggest any connexion with a school, while the scene is laid in London and among London citizens and is essentially a London play, furnish a strong argument that *Roister Doister* first appeared in 1553, and therefore could not have been written at Eton or for Eton boys.

Nor could it have been written at Westminster School or for Westminster boys, as argued by Professor Hales in *Eng. Studien* (1893) xviii. 408. For though Udal did become head master of Westminster, he only became so nearly two years after Wilson's quotation from *Roister Doister* appeared. He was at Winchester in the interval, for Stephen Gardiner, bishop of Winchester and chancellor, by will of the 8th of November 1555 (P.C.C. 3 Noodes), gave 40 marks (£26, 13s. 4d.) to "Nicholas Udale, my scholemaister." In what sense he was Gardiner's schoolmaster it is hard to guess. He was not head master or usher of Winchester College; but he may have been master of the old City Grammar or High School, to which the bishop appointed (A. F. Leach, *Hist. Winch. Coll.* 32, 48). The schoolhouse had been leased out for 41 years in 1544 but it is possible Gardiner had revived the school or kept a school at his palace of Wolvesey. At Westminster "Mr Udale was admitted to be scholemaster 16 Dec. anno 1555" (*Chapter Act-Book*)..

The last act of the secular canons, substituted by Henry VIII. for the monks, was the grant of a lease on the 24th of September 1556. When the monks re-entered, on Mary's restoration of the abbey (Nov. 21, 1556), the school did not, as commonly alleged, cease, nor had Udal ceased to be master (Shakespeare Soc. iii. xxxiv.) when he died a month later. The parish register of St Margaret's, Westminster, under "Burials in December A.D. 1556" records "11 die Katerine Woddall," "23 die Nicholas

Yevedale," *i.e.* Udal. Katharine was perhaps a sister or other relation, as Elizabeth Udall was buried there on the 8th of July 1559. The abbey cellarer's accounts ending Michaelmas 1557 contain a payment "to Thomas Notte, usher of the boys, £6, 10s., and to the scholars (*scolasticis vocatis le grammer childern*), £63, 6s. 8d.," showing that the usher carried on the school after Udal's death. Next year (1557–1558) the abbey receiver accounted for £20 paid to John Passey, (the new) schoolmaster, to Richard Spenser, usher, £15, and £133, 6s. 8d. for 40 grammar boys. So it is clear that the school never stopped. Udal therefore was master of Westminster for just over two years. He died at the age of 52.

Roister Doister well deserves its fame as the first English comedy. It is infinitely superior to any of its predecessors in form and substance. It has sometimes been described as a mere adaptation of Plautus's *Miles Gloriosus*. Though the central idea of the play—that of a braggart soldier (with an impecunious parasite to flatter him) who thinks every woman he sees falls in love with him and is finally shown to be an arrant coward—is undoubtedly taken from Plautus, yet the plot and incidents, and above all the dialogue, are absolutely original, and infinitely superior to those of Plautus. Even the final incident, in which the hero is routed, is made more humorous by the male slaves being represented by maid-servants with mops and pails.

The play was printed by F. Marshall in 1821; in Thomas White's *Old English Dramas* (3 vols., 1830); by the Shakespeare Society, vol. iii., the introduction to which contains the fullest and most accurate account of his life; in Edward Arber's reprints in 1869; and Dodsley's *Old Plays* (1894), vol. iii. (A. F. L.)

UDAL (Dan. *odel*), a kind of right still existing in Orkney and Shetland, and supposed to be a relic of the old allodial mode of landholding existing antecedently to the growth of feudalism in Scotland (see ALLODIUM). The udal tenant holds without charter by uninterrupted possession on payment to the Crown, the kirk, or a grantee from the Crown of a tribute called scat (Dan. *skat*), or without such payment, the latter right being more strictly the udal right. Udal lands descend to all the children equally. They are convertible into feus at the option of the udallers.

UDINE, a town and archiepiscopal see of Venetia, Italy, capital of the province of Udine, situated between the Gulf of Venice and the Alps, 84 m. by rail N.E. of Venice, 450 ft. above sea-level. Pop. (1906), 25,217 (town); 40,627 (commune). The town walls were in the main demolished towards the end of the 19th century. The old castle, at one time the residence of the patriarchs of Aquileia, and now used as a prison, was erected by Giovanni Fontana in 1517 in place of the older one destroyed by an earthquake in 1511. The Romanesque cathedral contains some interesting examples of native art (by Giovanni Martini da Udine, a pupil of Raphael, and others). The church of S. Maria della Purità has frescoes by Giovanni Battista and Domenico Tiepolo. In the principal square stands the town hall, built in 1448–1457 in the Venetian-Gothic style, and skilfully restored after a fire in 1876; opposite is a clock tower resembling that of the Piazza di San Marco at Venice. In the square is a statue of Peace, erected in commemoration of the peace of Campo Formio (1796), which lies 5 m. to the W.S.W. The archiepiscopal palace and Museo Civico, as well as the municipal buildings, have some valuable paintings. The leading industry of Udine is silk-spinning, but it also possesses manufactures of linen, cotton, hats and paper, tanneries and sugar refineries, and has a considerable trade in flax, hemp, &c. Branch railways lead to Cividale del Friuli and S. Giorgio di Nogaro, and a steam tramway to S. Daniele del Friuli.

The origin of Udine is uncertain; though it lay on the line of the Via Iulia Augusta, there is no proof of its existence in Roman times. In the middle ages it became a flourishing and populous city; in 1222 or 1238 the patriarch Berthold made it the capital of Friuli, and in 1420 it became Venetian. In 1752 it became an archbishopric. (T. As.)

UEBERWEG, FRIEDRICH (1826–1871), German historian of philosophy, was born on the 22nd of January 1826 at Leichlingen, in Rhenish Prussia, where his father was Lutheran pastor. Educated at Göttingen and Berlin, he qualified himself at Bonn as *Privatdozent* in philosophy (1852). In 1862 he was called to Königsberg as extraordinary professor, and in 1867 he was advanced to the ordinary grade. He married in 1863, and died on the 9th of June 1871. His compendious *History of Philosophy* is remarkable for fullness of information, conciseness, accuracy and impartiality. At first he followed Beneke's empiricism, and strongly opposed the subjectivistic tendency of the Kantian system, maintaining in particular the objectivity of space and time, which involved him in a somewhat violent controversy. His own mode of thought he preferred later to describe as an ideal realism, which refused to reduce reality to thought, but asserted a parallelism between the forms of existence and the forms of knowledge. Beneke and Schleiermacher exercised most influence upon the development of his thought.

WORKS.—*System der Logik* (1857; 5th ed., 1882; Eng. trans. of 3rd ed. by T. M. Lindsay, 1871); *Grundriss der Gesch. der Phil.* (1863–1866, 8th ed., M. Heinze, 1894–1898; Eng. trans., G. S. Morris, 1872; 4th ed., 1885); an essay (1861) on the authenticity and order of Plato's writings, crowned by the Imperial Academy of Vienna; *Schiller als. Hist. und Phil.* (published by Brasch from his papers, Leipzig, 1884). See F. A. Lange, *Friedrich Ueberweg* (Berlin, 1871); M. Brasch, *Die Welt- und Lebensanschauung Friedrich Ueberwegs* (Leipzig, 1889).

UELZEN, a town of Germany, in the Prussian province of Hanover, on the Ilmenau, east of the famous Lüneburger Heide, at the junction of the railway connecting Hamburg, Hanover, Bremen and Stendal, 52 m. S.E. of Hamburg. Pop. (1905), 9329. The town has four Evangelical churches, one of which, dedicated to the Holy Ghost, has a valuable altar-piece dating from the 14th century. The principal industries are flax, sugar, tobacco and machinery, and there is a trade in cattle and horses. In the vicinity are some interesting Slavonic remains and the former Benedictine monastery of Ullesheim.

Founded in the 10th century as Löwenwold, Uelzen became in the middle ages an active member of the Hanseatic League.

See Jaenicke, *Geschichte der Stadt Uelzen* (Hanover, 1889).

UFA, a government of south-eastern Russia, on the western slope of the Ural Mountains. It has the governments of Vyatka and Perm on the N., Orenburg on the E. and S., Samara and Kazañ on the W., and comprises an area of 47,094 sq. m. Several craggy and densely wooded ranges, running from S.W. to N.E. parallel to the main chain of the southern Urals, occupy its eastern part. They rise to altitudes of 2500 to 3500 ft.; their highest peaks—Iremel (5230 ft.), Urenga (4115 ft.) and Taganai (3935 ft.)—ascend above the limits of arboreal vegetation, but in no case reach those of perpetual snow. Southward Ufa extends over the slopes of the Obshchiy Syrt plateau, the angular space between the latter and the Urals being occupied by elevated plains (1000 to 1500 ft.), deeply grooved by the river valleys, and sometimes described as the "Ufa plateau." Towards the Kama the fertility of the soil increases, and the black-earth regions of Menzelinsk and Birsk are granaries for that part of Russia.

The geological structure of Ufa is very varied. The main range of the Urals consists of gneisses and various crystalline slates resting upon granites and syenites; next comes a broad strip of limestones and sandstones, the fossil fauna of which is intermediate between the Upper Silurian and the Lower Devonian. These form the highest elevations in the government. Farther west the Devonian deposits are followed by Lower and Upper Carboniferous and Artinsk schists, which, together with Permian deposits, cover western Ufa. Quaternary deposits are extensively developed in all the valleys, most of which were occupied by lakes during the Lacustrine period. There is great wealth in iron (Devonian) and copper (Permian). The district of Zlatoust is celebrated for its granite, epidote, nephrite and a variety of decorative stones and minerals. Coal is found over a wide area.

Ufa belongs almost entirely to the drainage area of the Byelaya, a tributary of the Kama, which rises in Orenburg and flows north and north-west through Ufa, receiving a number of tributaries, among which the Syun, the Tanyp and the Ufa are also navigable. The Byelaya is an important channel for trade; but it sometimes drops to so low an ebb in summer that steamers cannot proceed beyond Birsk. The Kama flows for 120 m. along the western border of the government.

The average temperature at the city of Ufa is 37° F., and the winter is extremely cold (January 5·5° F., July 68° F.); at the Zlatoust observatory the average temperature is only 32·2° (January 2°; July 61·8°). Even in the hilly tracts of Zlatoust the annual rainfall is not more than 19 in. The rivers are frozen 158 days at Ufa and 202 at Zlatoust.

The estimated population in 1900 was 2,620,600. The government is divided into six districts, the chief towns of which are Ufa, Belebey, Birsk, Menzelinsk, Sterlitamak and Zlatoust. Towns have sprung up around the ironworks at Zatkinsk, Yurezañ and Katav-Ivanovsk. The Russian element in the population has rapidly increased (in 1897, 45%; in 1865, 36%), the other ethnographical elements being mainly Bashkirs, Tatars and Meshcheryaks, together with Chuvashes and Cheremisses, Votyaks and Mordvinians. Since the wholesale plundering of the Bashkir lands, which took place under Alexander II., the land has been sold by the nobles, and bought chiefly by the merchant class. Large estates are common, though it is the peasants and the peasants' co-operative societies that cultivate most of the area under crops. Agriculture has greatly developed, owing partly to the Russian immigration and partly to the educational efforts of the local councils; in 1900 there were 4,860,000 acres (16%) under crops and 9,780,000 acres ($32\frac{1}{2}$%) under cultivation. The principal crops are rye, wheat, oats, barley, millet, buckwheat and potatoes.

The government is rich in antiquities belonging to three different periods—the Finnish or Chud period, the period of the Bulgarian empire, and the period of the Nogai Tatar domination. The burial-mounds of the Chudes contain brass implements and decorations, and in one of them near Ufa a coffin sheeted with silver was found. Remains from the Bulgarian epoch have been discovered at Menzelinsk. But it is the ruins of the Mongol period which are of greatest value; the remains of a large town, with a mausoleum and a palace, have been found near Ufa and extend several miles along the Byelaya River. (P. A. K.; J. T. Be.)

UFA, a town and river-port of Russia, capital of the government of the same name, situated 326 m. by rail N.E. of Samara, on the main line from Moscow to Siberia, at the confluence of the Ufa with the Byelaya. Pop., 49,275. The better part of the town contains two cathedrals and a few churches; the remainder is a scattered aggregation of small wooden houses. There are a museum, a public library and a theological seminary; and the industries include iron and copper works, machinery works and saw-mills.

Ufa was founded in 1574. The wooden kreml, or fort, protected by wooden towers and an outer earthen wall, had to sustain the attacks of the revolted Bashkirs and Russian serfs in 1662 and at later dates; and in 1773 Chika, one of the chiefs of the Pugachev revolt, besieged it for four months.

UGANDA, a British protectorate in Eastern Equatorial Africa, lying between Lakes Victoria and Albert and between the Mountain Nile and Lake Rudolf. The same name was originally applied to the Bantu kingdom of Buganda, which is one of the five provinces of the protectorate, but which is now styled officially by the correct native name of "Buganda." The Swahili followers of the first explorers always pronounced the territorial prefix, Bu, as a simple vowel, U; hence the incorrect rendering "Uganda" of the more primitive Bantu designation. It was first applied to the kingdom of Mutesa, discovered by J. H. Speke in 1862, and in time came to include the large protectorate which grew out of the extension of British influence over Buganda.

Boundaries and Area.—On the north the frontier of the protectorate is an undetermined line running between Lado (which lies a little north of 5° N.) on the Mountain Nile and the watershed of Lake Rudolf. This northern boundary is in any case conterminous with the southern boundary of the Anglo-Egyptian Sudan. On the east the limit of the Uganda Protectorate in 1901 was the *thalweg* of Lake Rudolf and a line drawn from the south-eastern coast of that lake south along the edge of the Laikipia and Kikuyu escarpments to the frontier of German East Africa. The southern frontier of Uganda was the 1st degree of S. lat.; the western was the 30th meridian of E. long., from the German frontier on the south, across Albert Edward Nyanza and the Semliki River to the line of water-parting between the systems of the Congo and the Nile (in the country of Mboga); thence northwards this western boundary descended to the north coast of Albert Nyanza at Mahagi, and then followed the main stream of the Nile to about 5° N. In 1904, however, it was found that the 30th meridian had been placed some 25 m. west of its true position in the maps used when the frontier was agreed upon, and that if it was maintained as the dividing line it would cut off the Uganda Protectorate from access to Albert Edward Nyanza while giving a corner of the Congo forest to Uganda. A survey commission was subsequently despatched, and in 1910 British, Belgian and German delegates met in Brussels to draw up a new frontier line. Germany was interested in the dispute, inasmuch as the southern frontier of the Uganda Protectorate coincided with the northern frontier

of German East Africa. Moreover Germany, Great Britain and Belgium (as inheritor of the Congo State) had conflicting claims in the region N.E. of Lake Kivu. On the 14th of May 1910 a protocol was signed defining the new frontier as follows: From the north end of Lake Kivu the Congo-German frontier turns east by north, traversing the volcanic region of Mfumbiro, and crosses the summit of Mt Karissimbi to the summit of Mt Sabyino, where the British, Belgian and German frontiers meet. From Mt Sabyino the frontier between Belgian Congo and the Uganda Protectorate goes in a direct line north to Mt Nkabwe, and thence along the Ishasha River, to its mouth on the S.E. shores of Albert Edward Nyanza. Thence it crosses that lake in a straight line and afterwards the Ruwenzori to its highest point, Margherita peak, whence it follows the Lamia River to its junction with the Semliki. From that point the frontier is formed by the Semliki to its mouth and the middle of Albert Nyanza to a point opposite Mahagi, where it meets the Congo-Sudan frontier.

Meantime in 1903 the then Eastern province of the Uganda Protectorate had been transferred to the adjoining East Africa Protectorate, the new eastern boundary being the west coast of Lake Rudolf, the river Turkwel, the eastern flanks of Mt Elgon, the Sio River, and a line running south from the mouth of the Sio across Victoria Nyanza to 1° S. The area of the protectorate, approximately 150,000 sq. m. in 1901, has been reduced by these changes to about 110,000 sq. m.

Climate.

Physical Features.—The protectorate, with a singularly diversified surface of lofty plateaus, snow-capped mountains, vast swamps, dense forests and regions of desolate aridity (valley of Lake Rudolf), offers a remarkable variety of climates. The Rudolf province lies low—an average altitude of not more than 2000 ft.—is extremely hot, and has a very poor rainfall. In some of its districts no rain falls for two years at a time, elsewhere scarcely as much as 10 in. per annum. The Eastern province is abundantly watered near Victoria Nyanza and around Mt Elgon and the noble Debasien mountain (about 50 in. to 100 in. annually); elsewhere, in Karamojo and the northern regions, the rainfall lessens to about 20 in. Busoga and the western part of the Elgon district in this province have a regular West African climate—hot, moist and not over-healthy. These are the conditions of Buganda, a country with an annual rainfall of from 60 to 80 in., a regular West African climate, and severe and frequent thunderstorms. Much the same may be said about the Western province, except for the cooling influence of the Ruwenzori snow range, which pleasantly affects Toro and northern Ankole. The rainfall on Ruwenzori and the central Semliki valley is quite 100 in. per annum. Along the Ruwenzori range are glaciers and snowfields nearly 15 m. in continuous length and some 5 m. in breadth. The Northern (formerly called the Nile) province is perhaps the hottest part of Uganda. Like the districts round Lake Rudolf, the average altitude (near the Nile) is not more than 2000 ft., but the rainfall is more abundant than in the terrible Rudolf region, being an average of 30 in. per annum.

Mountains, Lakes and Rivers.

The surface of the protectorate is diversified. Mount Elgon (*q.v.*) just outside the Eastern province is one of the leading physical features of the Uganda and East Africa protectorates. It consists of the vast crater—some 10 m. in diameter—of an extinct volcano, the rim of which rises in several places to over 14,000 ft. Terraces and buttresses extend and ramify in all directions from the central crater, so that the giant volcano and its surrounding heights form a mountain country (notable for its innumerable cascades and dense forests) the size of Montenegro. The mass of Elgon can be seen from the north-east coast of Victoria Nyanza, from near the main Nile stream, from the heights overlooking Lake Rudolf and from the Kikuyu escarpment. The Eastern province consists of well-forested, undulating land (Busoga) on the coast of the lake, a vast extent of marsh round the lake-like backwaters of the Victoria Nile (Lakes Ibrahim or Kioga, Kwania, &c.) and a more stony, open, grain-growing country (Bukedi, Lobor, Karamojo). The Turkana country west of Lake Rudolf has been of late years terribly arid. A little vegetation is met with in the stream valleys, but most of the rivers marked on the map have ceased to show running water in their lower courses. A good deal of high land—rising in some peaks to near 10,000 ft.—is found in the eastern part of the Northern province, and these heights attract moisture and nourish permanent streams flowing Nilewards. But much of the lower ground is stony and poor in vegetation, while the lowland near the main Nile is exceedingly marshy.

The Ripon Falls, in the centre of the northern coast of the Victoria Nyanza, at the head of the exquisitely beautiful Napoleon Gulf, mark the exit of the fully born Nile from the great lake. The Victoria Nile tumbles over 50 m. of cascades and rapids (descending some 700 ft. in that distance) between Ripon Falls and Kakoge. Here it broadens into Lake Ibrahim (Kioga) (in reality a vast backwater of the Nile discovered by Colonel Chaillé Long in 1874), and continues navigable (save for sudd obstacles at times) right through Lake Ibrahim and thence northwards for 100 m. to Foweira and Karuma Falls. Between Karuma and Murchison Falls the Victoria Nile is unnavigable. At Fajao the navigation can be resumed into Lake Albert. The main Nile stream when it quits Lake Albert continues navigable as far north as Nimule (3° 40′ N.). Between Nimule and Fort Berkeley the river flows through a deep gorge and falls nearly 1000 ft. Navigability really only begins again at Gondokoro on the Sudan frontier, from which point steamers ply to Khartum (see NILE).

The geography of the Western province includes many interesting features, the in many ways peculiar Albert Nyanza (*q.v.*), the great snowy range of Ruwenzori (*q.v.*), the dense Semliki, Budonga, Mpanga and Bunyaraguru forests, the salt lakes and salt springs of Unyoro and western Toro, the innumerable and singularly beautiful crater lakes of Toro and Ankole, the volcanic region of Mfumbiro (where active and extinct volcanoes rise in great cones to altitudes of from 11,000 to nearly 15,000 ft.), and the healthy plateaus of Ankole, which are in a lesser degree analogous in climate and position, and the Nandi plateau on the east of Victoria Nyanza. Ruwenzori is a snowy range, and not a single mountain. Its greatest altitude—the Duke of the Abruzzi's Mt Stanley (Margherita Peak)—is 16,816 ft., and therefore the third highest point on the African continent. The Uganda Protectorate is a land of great lakes, and includes partially or wholly the water areas of Victoria Nyanza (about 27,000 sq. m.), Lake Rudolf (about 3500 sq. m.), Lake Ibrahim-Kioga-Kwania (800 sq. m.), Albert Nyanza (2700 sq. m.), and Lakes Albert Edward and Dweru [1] (1500 sq. m.), besides the small crater lakes of Toro and Ankole (singularly beautiful), the lake-swamps Salisbury and Kirkpatrick in the Eastern province, Lakes Wamala in Buganda, and Kachera in Ankole. The water of Lake Victoria is perfectly fresh. This is the case with all the other lakes except Rudolf, Albert Nyanza and Albert Edward, in which the water ranges from salt to slightly brackish.

Geology.—Wide tracts remain geologically unexplored. Archean rocks—gneiss, schist and granite—cover large areas through which the Nile cuts its way in alternate narrow gorges and open reaches. In Ankole and Koki rocks consisting of granular quartzite, schistose sandstone, red and brown sandstone, and shales with cleaved killas rest on the Archean platform and possibly represent the Lower Witwatersrand beds of the Transvaal. No traces of the Karroo formation have been detected. Volcanic rocks occur in Usoga and elsewhere. The Nile at the Ripon Falls leaps over a basalt dike. The rocks on the verge of the Kisumu province of East Africa are mainly volcanic (basalt, tuff, lava, kenyte). West of the volcanic region, nearer to Lake Victoria and the Eastern province, ironstone, granite, gneiss and schistose formations predominate, with phonolite in places.

Petrology and Mineralogy.

Iron ore (haematite) is abundant. In the Eastern province the rocks are mainly quartz, gneiss and granite, with sandstone in Busoga, basalt round Mt Elgon, slate (Busoga) and ironstone (Busoga and Bukedi). In the Rudolf province there are the basalt, lava, tuff and kenyte of the volcanic Rift valley, overlying a formation of granite, gneiss and quartz. Gold—in some cases alluvial—is found in the mountainous country to the north-west of Lake Rudolf. Gneiss, granite and quartz—the decomposed granite giving the red "African" clay—are the leading features in the formations of the Northern province, of Buganda, and of the Western province, with some sandstone in the littoral districts of Buganda and in Ankole, and eruptive rocks and lava in south-western Ankole and on the eastern flanks of Ruwenzori. There are indications of copper in Busoga, of gold in Unyoro. Iron is found nearly everywhere. Graphite is present in Buganda and Unyoro.

Flora.—The vegetation is luxuriant except in the Rudolf region, which has the sparse flora of Somaliland. In the Western province, Busoga and the Elgon district the flora is very West African in character. The swampy regions of the Nile and of the Eastern province are characterized by an extravagant growth of papyrus and other rushes, of reeds and coarse grass. There are luxuriant tropical forests in the coast region of Buganda, in Busoga, west Elgon, western Unyoro, eastern Toro, the central Semliki valley and north-west Ankole. The upper regions of Mt Elgon, Mt Debasien and Mt Agoro are clothed with forests of conifers—juniper and yew—and witch-hazels (*Trichocladus*). There are also giant yew-trees (*Podocarpus*) on the flanks of Ruwenzori and the Mfumbiro volcanoes between 7000 and 9000 ft., but no junipers. The alpine vegetation on all these lofty mountains is of a mixed Cape and Abyssinian character—witch-hazels, senecios, lobelias, kniphofias, everlasting flowers, tree heaths and hypericums. The really tropical vegetation of Buganda is nearly identical with that of West Africa, but there is no oil-palm.

Fauna.—The fauna also has many West African affinities in the hot, forested regions. In the Kisumu province of East Africa even, there are several West African mammals such as the broad-horned tragelaph and the forest pig. These are also found in part of the Semliki forests. As a rule, however, the fauna of the Upper Semliki valley, of parts of Ankole, Buganda and Unyoro, of the Northern, Rudolf and Eastern provinces, is of that "East African," "Ethiopic" character which is specially the feature of South and East Africa and of the Sudan right across from Abyssinia to the river Senegal. Among notable mammals the chimpanzee is found in Unyoro, Toro and north-west Ankole, and has only recently become extinct in Buganda; the okapi inhabits the Semliki forests on the Congo frontier; the giraffe (the male sometimes developing five horn cores) is common in the Northern, Eastern and Rudolf provinces; there are three types of buffalo—the Cape, the Congo and the Abyssinian; two species of zebra (one of them Grévy's), the African wild ass, the square-lipped ("white") and pointed-lipped ("black") rhinoceroses, the elephant, hippopotamus, water tragelaph ("Speke's antelope"), Cape ant-bear, aard-wolf (*Proteles*), hunting-dog, and nearly every genus and most of the species of African antelopes. The birds are more West African than the mammals, and include the grey parrot, all the genera of the splendidly-coloured turacoes, the unique "whale-headed stork," and the ostrich.

Inhabitants.—The inhabitants in 1909 numbered about 3,500,000 natives, 3000 British Indians and Arabs, and 507 Europeans (British, French, Germans, Italians and Maltese). Of these last 119 were women. The races indigenous to the protectorate are mainly of the Negro species (with slight Caucasian intermixture), and may be divided into the following categories. (1) *Pigmy-prognathous* (so-called "Congo" pigmies of Semliki forest, of Kiagwe in Buganda, and of the western

[1] In 1909 Albert Edward Nyanza was renamed by British geographers (with the consent of Edward VII.) Lake Edward, and Lake Dweru Lake George, in honour of George V.

flanks of Mt Elgon and the types of Forest Negroes); (2) *Bantu negroes* (Banyoro, Bairu, Basese, Basoga, Bakonjo, Baganda, Masaba and Kavirondo); (3) *Nile negroes* (Aluru, Bari, Madi, Acholi, Gang, Lango, Latuka, Tesi, Sabei (Nandi), Turkana and Karamojo); (4) *Hamitic* (some tribes on islands and the north coast of Lake Rudolf; and the remarkable "Hima" or "Huma" aristocracy in Unyoro, Buganda, Toro and Ankole). The pigmies are generally known as Bambute or Bakwa in the Semliki forests. They are both reddish yellow and brownish black (according to individual variation) in skin colour, with head hair often tending to russet, and body hair of two kinds—black and bristly on the upper lip, chin, chest, axillae and pubes; and yellowish and fleecy on the cheeks, back and limbs. Their faces are remarkable for the long upper lip and the depressed broad nose with enormous alae. Associated with these pigmies is the "Forest Negro" type (Lendu, Lega, Baamba, Banande) of normal human stature, but short-legged and unusually prognathous. The Bantu negroes represent the future ruling race of the protectorate, and include the remarkable Baganda people. These last, prior to the arrival of Arabs and Europeans, displayed a nearer approach to civilization than has as yet been attained by an unaided Negro people. Their dynasty of monarchs can be traced back with tolerable certainty to a period coincident with the reign of Henry IV. of England (A.D. 1400). The first Buganda king was probably a Hamite of the Hima stock (from Unyoro). Until recent years the Baganda and most of the other Bantu peoples of the protectorate worshipped ancestral and nature spirits who had become elevated to the rank of gods and goddesses. The Baganda are now mainly Christian. There is also a "totem" system still in vogue. All the Baganda belong to one or other of twenty-nine clans, or "Biká," which are named after and have as totem familiar beasts, birds, fish or vegetables. The Baganda are not a very moral people, but they have an extreme regard for decency, and are always scrupulously clothed (formerly in bark-cloth, now in calico). As a general rule, it may be said that all the Bantu tribes in the western half of the protectorate, including the Basoga, are careful to consider decency in their clothing, while the Nilotic negroes are often completely nude in both sexes. More or less, absolute nudity among men is characteristic even of the Bahima (Hamites). But in this aristocratic caste the women are scrupulously clothed.

The Nile negroes and Hima are tall people. The former are seldom handsome, owing to their flat faces and projecting cheek-bones. The Bahima are often markedly handsome, even to European eyes. In the Bahima the proportion of Caucasian blood is about one-fourth; in the Nile negroes and Bantu from one-sixteenth to none at all. The aboriginal stock of the Uganda Protectorate is undoubtedly the pigmy-prognathous, which has gradually been absorbed, overlaid or exterminated by better developed specimens of the Negro sub-species, or by Negro-Caucasian hybrids from the north and north-east.

The languages spoken in the Uganda Protectorate belong to the following stocks: (1) *Hamitic* (Murle and Rendile of Lake Rudolf); (2) *Masai* (Bari, Elgumi, Turkana, Sūk, &c.); (2*a*) Sabei, on the northern slopes of Elgon and on Mt Debasien; (2*b*) *Nilotic* (Acholi, Aluru, Gang, &c.); (3) *Madi* (spoken on the Nile between Aluru and Bari, really of West African affinities); (4) Bantu (Lu-ganda, Runyoro, Lu-konjo, Kuamba, Lihuku, the Masaba languages of west Elgon and Kavirondo, &c.); and lastly, the unclassified, isolated *Lendu* and *Mbuba* spoken by some of the pigmy-prognathous peoples.

Towns.—The seat of the British administration is Entebbe ("a throne") on the south shores of a peninsula projecting into the Victoria Nyanza in 0° 4′ 2″ N. 32° 27′ 45″ E. It contains a number of commodious official residences, churches, hospitals, a laboratory, covered market, &c. The port is protected by a breakwater and provided with a pier on which is the customs-house. The native capital of Buganda is Mengo (pop. about 70,000), situated some 20 m. N. by E. of Entebbe. It is a straggling town built on seven steep hills: on one hill is the royal residence; on another (Namirembe = the hill of peace) was the cathedral of St Paul, destroyed by lightning in September 1910, and other buildings of the Anglican mission. St Paul's was a fine Gothic church of brick, built by the Baganda in 1901–1904. After its destruction steps were at once taken to rebuild the cathedral. On a third hill are the cathedral and mission buildings of the Roman Catholics. On still another hill, Kampala, the British fort and government and European quarters are situated. Some 7½ m. S. by E. of Kampala, and connected with it by monorail, is Kampala Port, on Victoria Nyanza. The capital of the Eastern province is Jinja, on the Victoria Nyanza, immediately above and east of the Ripon Falls. It is a thriving trading centre and port. Hoima is the administrative headquarters in Unyoro; Butiaba is a trading port of some importance on Lake Albert; Mbarara is the capital of Ankole. Kakindu, Mruli, Fowera and Fajao are government stations and trading posts on the Victoria Nile; Wadelai (*q.v.*), Nimule and Gondokoro (*q.v.*) are similar stations on the Mountain Nile. Bululu is a port on Lake Ibrahim.

Agriculture and Trade.—A few plantations are owned and managed by Europeans. Otherwise agriculture is in the hands of the natives. Some Baganda chiefs have started cotton, rubber and cocoa plantations, the botanic department assisting in this enterprise. Pará and *Funtumia* rubber trees are also cultivated by the department. (For the work of the botanic, forestry and scientific department, the government plantations, &c., see the *Colonial Report* [Miscellaneous], No. 64.) A forest area of 150 sq. m. has been leased to a European company. Trade is mainly conducted by native (*i.e.* Arab, Somali and Negro) traders, by British Indians and by Germans. The value of the trade during 1901–1902 was approximately £400,000 in imports (largely railway material) and £50,000 in exports. The articles exported were ivory, rubber, skins and hides, and livestock (for consumption in East Africa). These, except livestock, continue to be the main items of export. For the six years 1903–1904 to 1908–1909 the imports increased from £147,000 to £419,000, and the exports—produce of the protectorate—from £43,000 to £127,000. The imports included the transit trade (with the Belgian Congo and German East Africa), which grew from £8460 in 1903–1904 to £82,615 in 1908–1909. The transit trade in the last-named year included bullion valued at £33,000, being raw gold from the Kilo mines, Belgian Congo. Among the new industries are sugar and coffee plantations, while cotton, ground-nuts and rubber figure increasingly among the exports, cotton and cotton-seed being of special importance. Cotton goods, chiefly "Americani," are the chief imports, machinery, hardware and provisions ranking next. Large quantities of rice are imported from German East Africa. About 50% of the imports are from the United Kingdom and British possessions.

Communications.—In connexion with the railway from Mombasa to Victoria Nyanza a steamship service is maintained on the lake between Port Florence, Entebbe and other ports, including those in German territory. Government boats also ply on the Victoria Nile and Lake Kioga (Ibrahim) and on Albert Nyanza and the Mountain Nile. A railway (begun in 1910), some 50 m. long, runs from Jinja to Kakindu, *i.e.* along the Victoria Nile from its point of issue from the Nyanza to where it becomes navigable above Lake Kioga. Good roads connect Entebbe and Butiaba (the steamboat terminus on Albert Nyanza) and other districts. There is a direct telegraphic service to Gondokoro and Khartum and to Mombasa. The postal service is well organized.

Administrative Divisions and Government.—The protectorate is divided into five provinces—Rudolf, Eastern (formerly central), kingdom of Buganda, Western, and Northern (formerly Nile)—and these again into a number of administrative districts. The kingdom of Buganda, which has a thoroughly efficient and recognized native government, is subdivided into no fewer than nineteen "counties" or districts, but the other provinces have as a rule only three or four subdivisions.

The protectorate is administered by a governor and commander-in-chief, under the colonial office, residing at Entebbe, on the north-western coast of the Victoria Nyanza. He is assisted by a staff of officials similar to the functionaries of a Crown colony, but there is at present no legislative council. The natives are ordinarily under the direct rule of their own recognized chiefs, but in all the organized districts the governor alone has the power of life or death, of levying taxes, of carrying on war, of controlling waste lands and forests, and of administering justice to non-natives. In the case of Buganda special terms were accorded to the native king and people in the settlement dated the 10th of March 1900. The king was secured a minimum civil list of £1500 a year out of the native revenues; pensions were accorded to other members of the Buganda royal family; the salaries of ministers and governing chiefs were guaranteed; compensation in money was paid for removing the king's control over waste lands; definite estates were allotted to the king, royal family, nobility and native landowners; the native parliament or "Lukiko" was reorganized and its powers were defined; and many other points in dispute were settled. The king was accorded the title of "His Highness the Kabaka of Buganda," and his special salute was fixed at eleven guns. By this agreement the king and his people pledged themselves to pay hut and gun taxes to the administration of the protectorate. Somewhat similar arrangements on a lesser scale were made with the king of Ankole, the kings of Toro and Unyoro, and with the much less important chieftains or tribes of other districts. The territories north and north-east of these Bantu kingdoms are inhabited by Nilotic negroes and up to 1909 were left almost unadministered, except in close vicinity to the Nile banks.

The education of the natives is confined to the schools maintained by the missionaries, who are doing an excellent work. Manual, technical and higher education is provided. In 1909–1910 there were in the Anglican schools over 36,000 scholars, of whom 17,000 were girls. Of the total number of scholars over 26,000 were in the kingdom of Buganda. The Roman Catholic schools had in 1909 over 11,000 scholars. (See the *Col. Off. Report on Uganda*, No. 686.)

Expenditure and Revenue. The expenditure for 1902–1903 was fixed at £210,000, of which about £170,000 was furnished by an imperial grant-in-aid and the balance from local revenue. Between 1903 and 1909 the revenue increased from £51,000 to £102,000. Revenue is chiefly derived from hut and poll taxes, customs, wharfage dues, game licences and land tax. The hut and poll taxes yield about £62,000 a year. The expenditure increased from £186,000 in 1903 to £256,000 in 1909. Deficiencies are made good by parliamentary grants. The rupee (1s. 4d.) is the standard coin, with a subsidiary decimal coinage.

History.—The countries grouped under this protectorate were invaded at some relatively remote period—say, three to four thousand years ago—by Hamitic races from the north-east (akin to the ancestors of the ancient Egyptians, Gallas, Somalis), who mingled extensively with the Nile negroes first, and then with the aboriginal inhabitants of Buganda, Unyoro and Nandi. These Hamites brought with them a measure of Egyptian civilization, cattle, and the arts of metallurgy, pottery and other adjuncts to neolithic civilization. There was probably no direct intercourse with Egypt by way of the Nile, owing to the lake-like marshes between Bôr and Fashoda, but instead an overland traffic with Ethiopia (the Land of Punt) via Mt Elgon and the Rudolf regions. In time even this intercourse with the non-negro world died away, and powerful kingdoms with an aristocracy of Galla descent grew up in Buganda, Unyoro and Ankole.

The kingdom of Buganda especially dominated the lands of Victoria Nyanza in the 19th century. In the 'forties and 'fifties Egyptian officials, Austrian missionaries, and British, Dutch, Italian, and German explorers had carried our knowledge of the Nile beyond Khartum as far south as Gondokoro. In the same period of time the Zanzibar Arab traders were advancing from the south on the Bahima kingdoms of the western Victoria Nyanza and on Buganda. King Suna of Buganda first heard of the outer world of white men in 1850 from a runaway Baluch soldier of Zanzibar. Captains Burton and Speke, on their Tanganyika expedition, heard of Buganda from the Arab traders in 1857. Captain Speke in 1862 reached Buganda, the first of all Europeans to enter that country. In the early 'seventies Sir Samuel Baker (who had discovered Albert Nyanza) extended the rule of the Egyptian Sudan as far south as the Victoria Nile. General Gordon, who succeeded Baker, and who had Dr Emin Bey (afterwards Emin Pasha) as lieutenant, attempted through Colonel Charles Chaillé Long, in 1874, not only to annex Unyoro but also Buganda to the Egyptian dominions, and thoroughly established Egyptian control on Albert Nyanza. But owing to the indirect influence of the British government, exercised through Sir John Kirk at Zanzibar, the Egyptian dominions were prevented from coming south of the Victoria Nile.

Suna, the powerful king or emperor of Buganda, who was the first to hear of a world beyond Negroland, had been succeeded in 1857 by his still more celebrated son, Mutesa (*Mutesa* means the measurer). Mutesa had received Speke and Grant in a most friendly manner. Subsequent to their departure he had opened up relations with the British agent at Zanzibar. In 1875 he received an epoch-making visit from Sir H. M. Stanley. Stanley, in response to Mutesa's questions about religion, obtained from that king an invitation to Anglican missionaries, which he transmitted to London through the *Daily Telegraph*.[1] Having made the first survey of Victoria Nyanza and confirmed Speke's guesses as to its shape and area, Stanley passed on (half discovering Ruwenzori on the way) to the Congo.

Meanwhile the Zanzibar Arabs had reached Buganda in ever-increasing numbers as traders; but many of them were earnest propagandists of Islam, and strove hard (with some success) to convert to that religion the king and chiefs of Buganda and adjoining countries. In 1877 the Rev. C. T. Wilson, one of a party of missionaries sent in answer to Stanley's appeal by the Church Missionary Society of England, arrived in Uganda, and towards the end of 1878 was joined by Alexander Mackay. In 1879 another party arrived by the Nile route; and Wilson, after thirteen months' actual residence, left for England with Dr R. W. Felkin, who had arrived only three months before, taking with him envoys from Mutesa. In the same year the French Roman Catholic mission of the White Fathers of Algeria was inaugurated, and thus from 1879 dates the triangular rivalry of the creeds of Anglican and Roman Christianity and of Islam.

Christian Missions, 1877–1879.

In 1882 Islam gained an ascendancy, and the French withdrew for a time. In the autumn of 1884 Mutesa died. A great change had been wrought in Uganda during the latter years of his reign. Calico, fire-arms and swords had replaced the primitive bark-cloth and spear, while under the teaching of the missionary-engineer Mackay the native artisans had learnt to repair arms and use European tools. Mutesa was a clever man of restless energy, but regardless of human life and suffering, and consumed by vanity. He was succeeded by Mwanga, a cruel, weak and vicious youth. The intrigues of the Arabs led him to suspect the designs of the missionaries. He was alarmed at their influence over numbers of his people and resolved to stamp out Christianity.

Mutesa succeeded by Mwanga, 1884.

In the early 'eighties the aspirations of several European powers turned towards Africa as a field for commercial and colonial expansion. The restless Arabs of Zanzibar had since 1857 steadily advanced Zanzibar influence to Tanganyika, Nyasa, and even through the Masai countries to the north-east coast of Victoria Nyanza and the "back door" of Uganda. In 1882 the Royal Geographical Society despatched Joseph Thomson to discover through Masailand the direct route to Victoria Nyanza. Thomson succeeded (he also discovered Lake Baringo and Mt Elgon), but turned back from the frontier of Busoga in order not to provoke Mutesa to hostilities. Mr H. H. Johnston was despatched on a scientific mission to Kilimanjaro, and concluded treaties on which the British East Africa Company was subsequently based. The vague stir of these movements had perturbed Mutesa, and they were regarded with deep suspicion by his successor, Mwanga.

The annexations of Emin on Albert Nyanza, the visit of Thomson to the closed door of Busoga, the opposition of the Europeans to the slave trade, and, lastly, the identification of the missionaries with political embassies and their letters of introduction from secular authorities, added to Mwanga's fears, and early in 1885, simultaneously with the return of the French Fathers, the long smouldering hostility broke out, and the Christian converts were seized and burnt at the stake. Bishop Hannington, who attempted to enter Buganda by the forbidden route from the east, was murdered, and the Rev. R. P. Ashe and Mackay only redeemed their lives by presents. The Buganda Christians showed heroism, and in spite of tortures and death the religion spread rapidly. Mwanga now determined to rid himself of Christians and Mahommedans alike by inducing them to proceed to an island in the lake, where he meant to leave them to starve. The plot was discovered, and Mwanga fled to the south of the lake, and Kiwewa, his eldest brother, was made king. The chiefs of the rival creeds—British (Anglicans), French (Catholics), and Ba-Islamu, as they were called—divided the chiefships. The Mahommedans now formed a plot to oust the Christians, and treacherously massacred a number of their chiefs and then defeated their unprepared adherents. Kiwewa, refusing to submit to circumcision, was (after reigning three or four months) expelled by the Ba-Islamu, who placed another brother, Kalema, on the throne and began a fanatical propaganda, forcing the peasantry to submit to the hated circumcision. The British and French

Murder of Bishop Hannington. 1885.

Religious Feuds.

[1] The letter was entrusted to Linant de Bellefonds, a Belgian in the Egyptian service, who had been sent to Buganda by Gordon. On his return journey Bellefonds was murdered by the Bari. When his body was recovered Stanley's letter was found concealed in one of his boots and was forwarded to England.

factions, who had taken refuge in Ankole, could not agree even in their common exile, and nearly came to blows, but on the spur of threatened famine they agreed to combine and to take back Mwanga as their king and strike a blow for supremacy in Buganda. In May 1889 Mwanga, aided by the trader Charles Stokes, approached Buganda by water, and after several bloody battles captured the capital, but shortly afterwards was again defeated, and Kalema and the Ba-Islamu reoccupied Mengo (the native capital). Appeals for help were sent to Frederick John Jackson (subsequently lieutenant-governor of British East Africa), who had arrived on the east of the lake with a caravan of some 500 rifles, sent by the newly-formed East African Chartered Company. He replied saying he would come if all the expenses were guaranteed and the British flag accepted. Père Lourdel, who was Mwanga's chief adviser at this time, counselled acceptance of these terms, but Jackson at first marched in a different direction northwards. Returning three months later, he found that Dr Karl Peters, a German in command of an "Emin Pasha Relief" expedition, had passed through his camp, read his letters, and, acting on the information thus obtained, had marched to Buganda, arriving in February 1890, where with the aid of Lourdel he concluded a treaty which was kept secret from the British party, who repudiated it. The Baganda Christians, before the arrival of Peters, had again engaged the Mahommedans and driven them to the frontier of Unyoro, where King Kabarega gave them an asylum and aid. Kalema died later in the same year—1890—and was succeeded by Mbogo, a half brother of King Mutesa. The posts of honour had been divided between the rival factions. Peters's treaty had given fresh offence and added to the disputes arising in the division of the offices of state, and the factions were on the point of fighting. Jackson arrived in April with 180 gun-men (a portion of his caravan having mutinied), and presented a new treaty, which was refused by the French. Feeling ran high, and Jackson withdrew his treaty, and, taking a couple of envoys who should bring back word whether Uganda was to be French or British, he left the country, Mr Ernest Gedge remaining in charge of his expedition.

French and British Factions.

While these events were happening in Uganda the Anglo-German treaty of July 1890 had assigned Uganda to Great Britain, and in October 1890 Captain F. D. Lugard, then at Kikuyu, halfway between the coast and the lake, received instructions to go to Uganda. He had with him Messrs De Winton and W. Grant, some 50 Sudanese soldiers, and about 250 porters, armed with Snider carbines. Marching with unprecedented rapidity, he entered Mengo on the 18th of December. Lugard, by introducing the names "Protestant" and "Catholic"—till then unknown—and by insisting that all religion was free, endeavoured to dissociate it from politics, and urged that as Uganda was now under Great Britain there could be no hostile "French" faction. This attitude was welcome to neither faction, and for some days the position of the new arrivals on the little knoll of Kampala was very precarious. Lugard's first object was to obtain a treaty which would give him a right to intervene in the internal affairs of the country. The hostile French faction was much the stronger, since at this time the king (whom the whole of the pagan party followed) was of that faction; but after some critical episodes the treaty was signed on the 26th of December. Lugard then endeavoured to settle some of the burning disputes relative to the division of lands and chiefships, &c., and to gain the confidence of both parties. In this he was to some extent successful, and his position was strengthened by the arrival in January 1891 of Captain (subsequently Colonel) W. H. Williams, R.A., with a small force of Sudanese and a maxim. In April Lugard, hoping to achieve better results away from the capital, led the combined factions against the Mahommedans, then raiding the frontier, whom he defeated. Seeing that the situation in Buganda was impossible unless they had a strong central force, which the company could not provide, Lugard and Williams had formed the idea of enlisting the Sudanese who had been left by Emin and Stanley at the south end of the Albert Lake. Taking with him Kasagama, the rightful king of Toro, he traversed the north of Ankole, with which country he made a treaty, and passing thence through Unyoro, along the northern slopes of Ruwenzori, reached Kavali at the south end of Lake Albert, defeating the armies of Unyoro who opposed his progress. He brought away with him 8000 Sudanese men, women, children and slaves, under Selim Bey (an Egyptian officer). Some of these he left at the posts he established along southern Unyoro. After an absence of six months from Buganda, Lugard reached the capital at the end of the year (1891) with 200 or 300 Sudanese soldiers and two or three times that number of followers. Lugard little thought that in bringing these Sudanese, already (some of them) infected with the sleeping-sickness of the Congo forests, he was to introduce a disease which would kill off some 250,000 natives of Uganda in eight years. Meanwhile Williams, amid endless difficulties, with a mere handful of men, had managed to keep the two factions from civil war, though fighting had actually occurred in Buddu and in the Sese Islands.

Lugard's Arrival, 1890.

After Lugard's return a lull occurred till the coast caravan left, when lawlessness again broke out and several murders were committed. On the 22nd of January the killing of a Protestant at the capital (Mengo) produced a crisis. Lugard appealed to the king to do justice, but he himself was treated with scant courtesy, and his envoy was told that the French party would sack Kampala if Lugard interfered on behalf of the murdered man. In spite of strenuous efforts on the part of the British administrator to avert war the French party determined to fight, and finally attacked the British, who had assembled round Kampala. The king and French party were defeated and fled to the Sese Islands. The king and chiefs (except two ringleaders) were offered reinstatement, and they appeared anxious to accept these terms, but the French bishop joined them in the islands, and from that day all hopes of peace vanished. Fighting was recommenced by a "French" attack on "British" canoes, and Williams thereupon attacked the island and routed the hostile faction. After this the "French" slowly concentrated in Buddu in the south, the Protestants migrating thence. Williams then led a successful expedition against the Sese islanders and went on to the south of the lake to obtain one of the young princes—heirs to the throne—who were at the French mission there. But the Fathers were hostile, and though Mwanga was eager to accept Lugard's offers of reinstatement, he was a prisoner in the hands of his party. He succeeded eventually in escaping, and arrived in Mengo on the 30th of March (1892). A new treaty was made, and the British flag flew over the capital, while the French party were given a proportion of chiefships and assigned the province of Buddu. These conditions they themselves said were liberal, nor could they have ventured to assume their old positions throughout Uganda.

Civil War, 1891.

The Mahommedans had all this time refrained from attacking the capital as had been expected. They now clamoured for recognition, and Lugard went to meet them, and after a somewhat precarious and very difficult interview he succeeded in bringing back their king Mbogo to Kampala, and in assigning them three minor provinces in Uganda.[1]

Lugard on his return to Uganda at the end of 1891 had received orders to evacuate the country with his whole force, as the company could no longer maintain their position. A reprieve till the end of 1892 followed, funds having been raised through the efforts of Bishop Tucker by the Church Missionary Society and friends. The lives of many Europeans were at stake, for anarchy must follow the withdrawal, and it seemed impossible to repudiate the pledges to Toro, or to abandon the Baganda who had fought for the British. In June 1892, therefore, Lugard determined to leave for England to appeal against the decision for abandonment. Williams remained in Uganda, where the outlook was now fairly promising, and every effort

The Question of Evacuation, 1892.

[1] Since reduced to one.

was made to reduce expenses. On arrival in England Lugard found that the British Government had decided not to come to the help of the company, and Uganda was to be left to its fate. A strong movement was set on foot for the "retention of Uganda," and on the 10th of December Lord Rosebery despatched Sir Gerald Portal to report on the best means of dealing with the country, and a subsidy was given to the company to enable them to retain their troops there till the 31st of March 1893. Captain (afterwards General Sir) J. R. L. Macdonald, who had been in charge of a railway survey to Uganda, was directed to inquire into the claims put forward by France for compensation for the priests. His report was set aside by the government, which, without admitting liability, but to close the controversy with France, agreed to pay £10,000 to the French priests, and the foreign office published a categorical reply by Lugard to the accusations made. Portal and his staff reached Uganda in March, and Williams left soon afterwards with the original troops of the company, leaving Selim Bey and the Sudanese and Portal's large escort in Uganda. The country on Portal's arrival bore every mark of prosperity and revival. By increasing the territory of the Roman Catholics, and giving them estates on the road from Buddu to the capital, Portal gave effect to projects which the Protestants had violently opposed. He added also to their chiefships, and on the 1st of April hoisted the British flag, made a new treaty with Mwanga, and sent Major Roderick Owen to enlist 400 Sudanese from the Toro colonies. He recommended to the imperial government the retention of Uganda (*i.e.* Buganda), the abandonment of Unyoro and Toro, and the construction of a railway half-way only to the lake. He departed after two and a half months' residence, leaving Macdonald in charge. During Macdonald's administration the Sudanese under Selim Bey began to conspire against the British control. The movement was checked and Selim Bey was deported to the coast.

Portal's Mission.

In November 1893 Colonel (Sir Henry) Colvile arrived to take charge, and at once led the whole of the Baganda army against King Kabarega of Unyoro. Major R. Owen defeated the hostile army, first in the south and later in the north, and the Baganda chiefs scattered the main body, while Colvile occupied the capital and built a line of forts from Buganda to Lake Albert, of which he left Major A. B. Thruston in command. This officer fought a number of brilliant actions, and aided by Major (later Colonel) G. G. Cunningham, Captain Seymour Vandeleur, William Grant and others, he overran Unyoro and broke down all resistance. In June 1894 Uganda (*i.e.* the kingdom of Buganda) was declared a protectorate, and at the end of the year Sir Henry Colvile was invalided. Mr F. J. Jackson now took temporary charge, pending the arrival in June 1895 of Mr E. J. L. Berkeley, the first administrator.

Colvile's Occupation of Unyoro.

At this time also it was decided to construct a railway to Uganda, but work was not begun till December 1896. Peace seemed assured in Uganda; territorial limits to religious teaching were abolished, English Roman Catholic priests were added to the French Fathers, and the material progress of the country was very marked. European traders settled in the country, good permanent houses were built, roads were made and kept in repair, and many new industries introduced, chief among which were the expression of oil from various oilseeds and the cultivation of coffee. Trees were imported and land set aside for planting forests. The success of these efforts at progress was largely due to Mr G. Wilson, C.B., who had been sent to Uganda from East Africa as an assistant administrator in 1896. In this year also the protectorate was extended over Unyoro and Busoga.[1]

In the middle of 1897 this era of peace was rudely interrupted. Colonel Trevor Ternan was acting commissioner, and Macdonald had returned to East Africa in command of an exploring expedition, for which Ternan had been ordered to supply 300 Sudanese. In June Wilson discovered a plot to revolt, and in July Mwanga fled to the south of Buddu and raised the standard of rebellion. The rebels were defeated, while Mwanga was made a prisoner by the Germans. Ternan, unaware of the disaffection of his men, now sent three companies to Macdonald, selecting those who had been continuously fighting in Unyoro, Nandi and Buddu. This caused great discontent, which was increased by the fact that their pay was six months in arrears and their clothing long overdue. The men, too, resented the fact that their pay was but a fifth of that given to Zanzibari porters and to those of their own body enlisted in the adjoining protectorate. They were sore at again being sent on service without their wives, and complained of harsh treatment from their officers. Necessaries had been delayed in the attempt to import steamers from the coast before the railway was made.

Rebellion of 1897.

After Colonel Ternan's departure on leave the three companies who had joined Macdonald broke out into revolt in the Nandi district (East Africa) and set off to Uganda, looting the countries they passed through. Macdonald and Jackson followed with a force of Zanzibaris. Meanwhile Major Thruston—a man justly loved by his soldiers, in whom he had complete confidence—hurried to the garrison at Luba's, near the Ripon Falls, relying on his personal influence to control the men, and risking his life in the heroic attempt. He and two other Europeans were seized and made prisoners. On the 19th of October a battle was fought between the mutineers and Macdonald's force, in which the former were defeated. The same night the Sudanese leaders, fearful lest their men might submit, murdered Thruston and his companions and sent letters to Uganda to incite their comrades to mutiny. Wilson, however, had already disarmed the troops in Kampala, who remained loyal, as also did Mbogo, the ex-king of the Baganda Mahommedans. A large Protestant army now went to the assistance of Macdonald, and from the 19th of October to the 9th of January the siege of Luba's continued, with constant skirmishes, among the killed being the Rev. G. Pilkington. Early in January Mwanga escaped from the Germans, and, declaring himself a Mahommedan, reached Buddu with a large force, which Major Macdonald defeated with the aid of the Baganda army. He then disarmed the Sudanese garrisons in Buddu. The garrisons in Unyoro (about 500) and in Toro remained loyal. Meanwhile the Sudanese at Luba's (numbering 600, with 200 Mahommedan Baganda) escaped, proceeded up the east bank of the Nile and crossed the river, making their way to Mruli. It appeared probable that if they reached that point the Sudanese garrisons in Unyoro would revolt as well as the Baganda Mahommedans, and the last hope of the Europeans would be lost. Leaving a small column to deal with Mwanga's force in the south, and another with Kabarega, Macdonald pursued the mutineers, overtook them in the swamps of Lake Kioga, and after a couple of successful skirmishes returned to Kampala, leaving Captain (afterwards Colonel) E. G. Harrison in command. That officer, crossing a swamp supposed to be impassable, attacked the rebel stockade at Kabagambi, and carried it with great gallantry. Captain Maloney was killed and Lieut. Osborne wounded, but the crisis was past. A large number of Indian troops arrived early in 1899, and in May Colonel C. G. Martyr inflicted another heavy defeat on the mutineers at Mruli. Mwanga, however, managed to get through and join Kabarega and the rebels in the north. These were dealt with in a series of engagements, but it was not till June 1899 that Colonel J. T. Evatt had the good fortune to capture Kings Mwanga and Kabarega, who were deported to the coast and subsequently removed to the Seychelles, where Mwanga died in 1903. Colonel Martyr at the close of the year (1899) undertook an expedition up the Nile, and extended the limits of the protectorate in that direction. Major H. H. Austin, who had come up to Uganda in 1897 with Macdonald and had fought through the mutiny operations, revealed the regions north of Mt Elgon. Colonel C. Delmé-Radcliffe finally subdued the last

Sudanese Mutiny.

[1] Toro, Ankole, Bukedi and the other countries now included in the protectorate were added by Sir Harry Johnston in 1899–1901.

remnant of the Sudanese mutineers in 1900–1901. The year 1899 had been a costly one, £329,000 being voted in aid. In the autumn of 1899 Sir Harry Johnston was sent out as special commissioner to Uganda, being also given the rank of commander-in-chief. By extensive reorganizations, and in spite of having to cope with a rising in Nandi, his commission resulted in the reduction of expenditure and increase of local revenue. He gave the kingdom of Buganda a definite constitution, settled the land question in the provinces of Buganda, Busoga, Unyoro, Toro and Ankole, and also the question of native taxation. By the treaty of Mengo, signed in March 1900, the young king of Buganda, Daudi Chwa, a son of Mwanga, born in 1896, was accorded the title of his Highness the Kabaka. During his minority the kingdom of Buganda was governed by regents. In 1900, the Uganda Protectorate was divided into six provinces, but in 1903 the Eastern and part of the Central provinces were transferred to the British East Africa Protectorate.

In 1902 the Uganda railway, begun in 1896, was finished. Its terminus is at Kisumu (Port Florence) on Kavirondo Gulf, Victoria Nyanza. It is some 580 m. long, ascends in places to altitudes of 7000 and 8000 ft. (highest point 8300 ft.), but has only one tunnel. Its cost was about £5,300,000. (See British East Africa.)

Colonel Sir James H. Sadler succeeded Sir Harry Johnston in 1902 and was transferred to East Africa in 1905. His place in Uganda was taken by Sir Henry Hesketh Bell, who was made the first governor of Uganda in 1906. The ravages of sleeping-sickness between 1901 and 1909 destroyed upwards of a quarter of a million people, and the whole of the native population had to be removed from the lake shores and the Sese Islands; but nevertheless the protectorate continued to make steady progress in civilization and in the development of its material resources. Its transit trade, especially with the Belgian Congo, became of great importance. To facilitate commerce with the Congo and with the Anglo-Egyptian Sudan and to open up the Busoga region the British government in 1910 voted money to build a railway from Jinja to Kakindu. The work was carried out under the superintendence of Captain H. E. S. Cordeaux, who became governor of the protectorate in 1910.

UGLICH, a town of Russia, in the government of Yaroslavl, on the upper Volga, 63 m. W. by S. of the city of Yaroslavl. Pop., 9698. Its historical remains are mostly associated with Prince Dmitri, son of Ivan the Terrible, who was believed to have been murdered (1591) here by Boris Godunov. The wooden house (built in 1481, restored in 1892) which the prince occupied, a church of St Demetrius, erected at the spot where he was killed, and a kiosk on the site of a convent where his mother was forcibly consecrated a nun, are the principal memorials of this incident. The cathedral was erected in the 13th century, but subsequently restored, and contains the grave of Prince Roman. The industries include paper-mills, flour-mills, distilleries, copper works, and linen factories; and the samovars (tea-urns) and sausages made here are famous.

The local annals go as far back as the 9th century. Until the 14th century Uglich was a separate principality, which extended over eastern Tver. In 1329 the sons of Prince Roman the Saint renounced their independence in favour of Moscow, and fifty years later the Uglich princes sold their rights to the great prince of Moscow. The Tatars plundered the town in 1237, 1293 and 1408, and the Lithuanians did the same at a later date.

UHDE, FRITZ KARL HERMANN VON (1848–), German painter, was born at Wolkenburg in Saxony. His artistic career, for which he studied first in Dresden, was interrupted for nearly ten years by military service, which included the two years of the Franco-German War, but in 1877 he again turned his attention to art, studying under Munkacsy in Paris and afterwards independently in Holland. His inclination was from the first directed towards religious subjects. He revived the practice of treating Biblical episodes realistically by transferring them to modern days. Thus in the "Come, Lord Jesus, be our Guest," of the Berlin National Gallery, Christ appears among the peasant family assembled for their meal in a modern German farmhouse "parlour," and in "The Sermon on the Mount" (Berlin, private collection) addresses a crowd of 19th century harvesters. Similar in conception are "Suffer Little Children to come unto Me" (Leipzig Museum), "The Holy Night" (Dresden Gallery), "The Last Supper," "The Journey to Bethlehem" (Munich Pinakothek) and "The Miraculous Draught of Fishes." Other works of his in public collections are: "Saying Grace," at the Luxembourg in Paris; "Christ at Emmaus," at the Staedel Institute, Frankfort; "The Farewell of Tobias," at the Liechtenstein Gallery, Vienna; and a portrait of the actor Wohlmuth, at the Christiania Museum. Von Uhde became professor and honorary member of the academies of Munich, Dresden and Berlin.

UHLAND, JOHANN LUDWIG (1787–1862), German poet, was born at Tübingen on the 26th of April 1787. He studied jurisprudence at the university of his native place, but also devoted much time to medieval literature. Having graduated as a doctor of laws in 1810, he went for some months to Paris; and from 1812 to 1814 he worked at his profession in Stuttgart, in the bureau of the minister of justice. He had begun his career as a poet in 1807 and 1808 by contributing ballads and lyrics to L. von Seckendorff's *Musenalmanach*; and in 1812 and 1813 he wrote poems for J. Kerner's *Poetischer Almanach* and *Deutscher Dichterwald*. In 1815 he collected his poems in a volume entitled *Gedichte*, which almost immediately secured a wide circle of readers. To almost every new edition he added some fresh poems. He wrote two dramatic works—*Ernst, Herzog von Schwaben* and *Ludwig der Baier*—the former published in 1818, the latter in 1819. These, however, are unimportant in comparison with his *Gedichte*. As a lyric poet, Uhland must be classed with the writers of the romantic school, for, like them, he found in the middle ages the subjects which appealed most strongly to his imagination. But his style has a precision, suppleness and grace which sharply distinguish his most characteristic writings from those of the romantic poets. Uhland wrote manly poems in defence of freedom, and in the states assembly of Württemberg he played a distinguished part as one of the most vigorous and consistent of the liberal members. In 1829 he was made extraordinary professor of German literature at the university of Tübingen, but he resigned this appointment in 1833, when it was found to be incompatible with his political views. In 1848 he became a member of the Frankfort parliament.

Uhland was not only a poet and politician; he was also an ardent student of the history of literature. In 1812 he published an interesting essay on *Das altfranzösische Epos*; and ten years afterwards this was followed by an admirable work on Walther von der Vogelweide. He was also the author of an elaborate study of *Der Mythus von Thôr nach nordischen Quellen* (1836), and he formed a valuable collection of *Alte hoch- und niederdeutsche Volkslieder*, which appeared in 1844–1845. He died at Tübingen on the 13th of November 1862.

Uhland's *Gesammelte Werke*, edited by H. Fischer, were published in 1892 in 6 vols.; also by L. Fränkel (2 vols., 1893) and L. Holthof (1901). His *Gedichte* passed through nearly fifty editions in the poet's lifetime; jubilee edition of the *Gedichte und Dramen* (1886). A critical edition by E. Schmidt and J. Hartmann appeared in 1898 (2 vols.). Uhland's *Schriften zur Geschichte der Dichtung und Sage* were published in 8 vols. (1865–1873); his *Tagebuch von 1810–1820* by J. Hartmann (1893). See F. Notter, *L. Uhland, sein Leben und seine Dichtungen* (1863); K. Mayer, *L. Uhland, seine Freunde und Zeitgenossen* (2 vols., 1867); *L. Uhlands Leben* (with *Nachlass*), by his widow (1874); A. von Keller, *Uhland als Dramatiker* (1877); H. Dederich, *L. Uhland als Dichter und Patriot* (1886); W. L. Holland, *Zu Uhlands Gedächtnis* (1886); H. Fischer, *L. Uhland* (1887); H. Maync, *Uhlands Jugenddichtung* (1899).

UIGHUR, or Ouighour, the name of a Turkish tribe and dynasty who came from the East and ruled in Kashgaria from the 10th to the 12th centuries. They used a variety of the Syriac alphabet. (See Turks.)

UIST, NORTH AND SOUTH, islands of the outer Hebrides, Inverness-shire, Scotland. North Uist lies S.W. of Harris (Long Island), from which it is separated about 8 m. by the Sound of Harris. The island measures 14 m. in length by 16 m. in greatest width, but the coasts are extremely indented. The highest point is Mt Eaval (1138 ft.). The principal sea-lochs are Loch Maddy and Loch Eport, both on the east. On the east coast the surface is mostly swampy moorland, but on the west there is some fertile soil. The inhabitants are chiefly engaged in crofting, fishing and cattle-rearing. The principal village, Loch Maddy, is the centre of a large trade, and is a favourite resort of anglers, being a regular calling station for the steamers from Oban and Portree. The islands belonging to the parish of North Uist comprise—to the south-west Balleshare and Illeray (pop., 383), Kirkibost, Heisker (98), and the Monach group, with a lighthouse on Shillay; to the south, Grimisay (290) and Ronay; to the north-east, Levera; to the north, Boreray (118) and Vallay.

South Uist has a population (1901) of 3541, an extreme length of 22 m. and an extreme width of 8 m. Towards the north-east it becomes mountainous, the highest points being Buail'a Choill (2034), Ben More (1994) and Hecla (1988). The chief sea-lochs are Loch Boisdale, largely frequented by anglers, Loch Eynort and Loch Skiport on the east coast. On the east side the surface is mainly alluvial peat, broken by hills, but on the west there is a belt of productive land. Besides crofting, the inhabitants are engaged in the fisheries and cattle-raising. Steamers from Oban call regularly at the village of Loch Boisdale. The islands attached to the parish of South Uist include, to the south, Eriskay (pop., 3478), where Prince Charles landed on the 2nd of August 1745; to the north-east, Wiay; to the north, Grimisay, Fladda, just off the north-east shore of Benbecula, and Benbecula (pop., 1417), with an area of 40 sq. m., from which there is at low tide a ford to North and South Uist.

UITENHAGE, a town of the Cape province, South Africa, in the valley of the Zwartkops river, 270 ft. above the sea, 21 m. by rail N.N.W. of Port Elizabeth. Pop. (1904), 12,193, of whom 6680 were whites. It was founded in 1804 by De Mist, the Batavian commissioner, who took over Cape Colony from the British in 1803. Many natives find employment in the mills along the Zwartkops, where vast quantities of wool from the sheep farms of the eastern part of the province are cleansed and forwarded for shipment at Port Elizabeth. Extensive railway works are established here. There are in addition large flower and fruit nurseries. The town is laid out in rectangular blocks, and contains a handsome town-hall, court-house and public offices.

UJEST (Polish, *Viast*), a small town on the Klodnitz in Prussia, which gives the title of duke to the head of the family of Hohenlohe-Öhringen, a branch (1823) of that of Hohenlohe-Ingelfingen (see Hohenlohe). Prince Hugo of Hohenlohe-Öhringen was created duke of Ujest in 1861, and in 1897 was succeeded by his son Christian Kraft (b. 1848). The duke is an hereditary member of the upper houses of Württemberg and Prussia.

UJIJI, a town in German East Africa, also known as Kavele, situated on the eastern shores of Lake Tanganyika, in 4° 55′ S., 29° 40′ E. It is connected with Cape Town by an overland telegraph line. The population (about 14,000) is composed of Arabs and members of numerous Central African tribes. Ujiji is the meeting-point of merchants from all parts of Tanganyika, and the terminus of the caravan route from Dar-es-Salaam. Arabs from Zanzibar made Ujiji their headquarters during the first half of the 19th century, and it became a great slave and ivory mart. In 1858 Richard Burton and J. H. Speke reached Ujiji from Zanzibar, being the first Europeans to see Lake Tanganyika. In 1869 David Livingstone, coming from the south, arrived at Ujiji, and it was here that H. M. Stanley found him on the 28th of October 1871. In 1890 it came within the German sphere of influence. (See Tanganyika and German East Africa.)

UJJAIN, or Ujain, a city of central India, in the state of Gwalior, on the right bank of the river Sipra, with a station on the branch of the Rajputana railway from Ratlam to Bhopal. Pop. (1901) 39,892. Ujjain, known as Avanti in the Buddhist period and as Ozene to the Greeks, is one of the seven sacred cities of the Hindus and the traditional capital of King Vikramaditya, at whose court the "nine gems" of Sanskirt literature are said to have flourished. It marks the first meridian of longitude in Hindu geography. It is heard of first as the residence of Asoka (afterwards emperor), when viceroy of the western provinces. It was sacked by the Mahommedans in 1235. Under Akbar it became the capital of Malwa, and during the last half of the 18th century it was the headquarters of Sindhia. It contains few old buildings, though relics of antiquity are often found on the abandoned site of the old city. It is now a centre of the trade in Malwa opium, with a wealthy colony of Bohra merchants. The principal institutions are the Madhava College (called after the present Maharaja), two state hospitals, and a dispensary belonging to the Canadian Presbyterian mission. A great religious festival is held here every twelfth year.

UJVIDÉK (German, *Neusatz*), a town of Hungary in the county of Bács-Bodrog, 171 m. S.S.E. of Budapest by rail. Pop. (1900), 28,763. It is situated on the left bank of the Danube near the terminus of the Franz-Josef canal. It is the seat of a Greek Orthodox bishop, and has become the literary and religious centre of the Servians in Hungary, especially since the foundation in 1864 of the *Matica Srbska*, or Servian Literary Society. The town was founded in the middle of the 18th century, and was almost totally destroyed during the revolution of 1848–49. On the opposite bank of the Danube, connected with Ujvidék by a railway bridge, lies Pétervárad or Peterwardein.

UKAZ, or Ukase (Russ., from *ukazat*, a shortened form of *ukazlivat*, to show, announce, prescribe), a term applied in Russia to an edict or ordinance, legislative or administrative, having the force of law. A ukaz proceeds either from the emperor or from the senate, which has the power of issuing such ordinances for the purpose of carrying out existing decrees. All such decrees are promulgated by the senate. A difference is drawn between the ukaz signed by the emperor's hand and his verbal ukaz, or order, made upon a report submitted to him. (See Russia: *Constitution and Government*.)

UKRAINE ("frontier"), the name formerly given to a district of European Russia, now comprising the governments of Kharkov, Kiev, Podolia and Poltava. The portion east of the Dnieper became Russian in 1686 and the portion west of that river in 1793.

ULAN (formerly spelt Uhlan), originally a Polish cavalry soldier armed with a lance. These troops were light cavalry, and wore the national dress and *czapka* (or lancer cap). They were introduced into the Prussian service in 1740, but failed to distinguish themselves in the first Silesian War, and it was only after the treaty of Tilsit (1807) that Ulan regiments were again formed in the Prussian army. In the Austrian army a "Uhlanpulk" of Poles was formed in 1784 and ordinary Ulan regiments of Austrian cavalry in 1791. The Austrian Ulans no longer carry the lance. In the German army of to-day Ulans are classed as heavy cavalry and wear the distinctive lancer dress inherited from the original Polish light horse. (See CAVALRY and LANCE.)

ULBACH, LOUIS (1822–1889), French writer, was born at Troyes (Aube) on the 7th of March 1822. He was encouraged to take up a literary career by Victor Hugo. He became dramatic critic of the *Temps*, and attracted attention by a series of satirical letters addressed to the *Figaro* over the signature of "Ferragus," and published separately in 1868. He edited the *Revue de Paris* until its suppression in 1858, and in 1868 he founded a paper, *La Cloche*, which was suppressed in 1869 for its hostility to the empire. Ulbach was imprisoned for six months, and when on his release he revived the paper he got into trouble both with the commune and the government, and was again imprisoned in 1871–1872. In 1878 he was made librarian of the arsenal, and died in Paris on the 16th of April 1889.

Among his works are: *Voyage autour de mon clocher* (1864), *Nos contemporains* (1869–1871), *Aventures de trois grandes dames de la cour de Vienne* (3 vols., 1876); *Les Buveurs de poisons: la fée verte* (1879), *La Vie de Victor Hugo* (1886), &c.

ULCER, an open sore (derived through the French from Lat. *ulcus*, Gr. ἕλκος). When a portion of animal tissue dies in consequence of an infection or injury, the death of that tissue taking place by gradual breaking down or disintegration, the process is termed *ulceration* and the result an ulcer. When the ulcer is spreading the place is painful and the surrounding parts are flushed with extra blood, but under appropriate treatment the destructive process ceases and the ulcer gradually heals. The bright surface of the ulcer becomes glazed over, and those changes take place in it which occur in an open wound. The ulcer gradually contracts, and round its edges cicatrization, or scarring, occurs. Ulcers may arise from various causes in different parts of the body, and in association with certain specific diseases, such as syphilis, tubercle, cancer and typhoid fever. (For GASTRIC ULCER see the separate article.) (E.O.*)

ULEÅBORG (Finnish, *Oulu*), a province in the grand duchy of Finland, including a wide territory to the north of Kuopio and nearly reaching Varangerfjord, taking in the high dreary plateau of Laponia (16,000 sq. m.) and the fertile plains of Österbotten. It has a total area of 63,970 sq. m., with a population, chiefly agricultural in Österbotten and nomadic in Laponia, of (1904) 295,187. The bulk of the inhabitants (99%) are Finnish. There are immense forests, and onlv 0·4% of the area is under culture. The capital of the government is Uleåborg, a seaport on the Gulf of Bothnia, now connected by railway with Helsingfors (498 m.); pop. (1904), 17,737.

ULEMA (Arab. *'ulamā*, sing. *'ālim*, literally "knowers," in the sense of *scientes*), the learned of Islām, theologians, canon-lawyers, professors, judges, muftīs, &c., all who, whether in office or not, are versed theoretically and practically in Muslim science in general. By "science" in this case is especially meant what is learned from tradition, books or men, and through the intellect. In a narrower sense, Ulema is used, in a Muslim state, of a council of such learned men, holding government appointments. If all conception of intermediary priesthood be eliminated, the Ulema may be said to be equivalent to the secular clergy of Roman Christendom (see DERVISH). Opposed to them, again, are the *'ārifs* ("knowers," "perceivers," *sentientes*, as opposed to *scientes*), to whom religious knowledge comes in the vision of the mystic, not by tradition or reason (see ṢŪFIISM).

On the training of the ulema see SUNNITES. (D. B. MA.)

ULFELDT, KORFITS (1606–1664), Danish statesman, was the son of the chancellor Jacob Ulfeldt. After a careful education abroad he returned to Denmark in 1629 and quickly won the favour of Christian IV. In 1634 he was made a Knight of the Elephant, in 1636 became councillor of state, in 1637 governor of Copenhagen, and in 1643 lord treasurer. In 1637 he married the king's daughter Leonora Christina, who had been betrothed to him from her ninth year. Ulfeldt was the most striking personality at the Danish court in all superficial accomplishments, but his character was marked by ambition, avarice and absolute lack of honour or conscience. He was largely responsible for the disasters of the Swedish war of 1643–45, and when the treaty of Brömsebro was signed there was a violent scene between him and the king, though Ulfeldt's resignation was not accepted. In December 1646 he was sent as ambassador extraordinary to the Hague, but the results of his embassy by no means corresponded to its costliness, and when he returned to Denmark in July 1647 he found the king profoundly irritated. Ulfeldt, supported by the Raad and the nobility, who objected to Christian's fiscal policy, resisted his father-in-law, and triumphed completely. As lord high steward he was the virtual ruler of Denmark during the two months which elapsed between the death of Christian IV. and the election of Frederick III. (July 6, 1648); but the new king was by no means disposed to tolerate the outrageous usurpations of Ulfeldt and his wife, and this antagonism was still further complicated by allegations of a plot (ultimately proved to be false, but believed at the time to be true) on the part of Dina Winhavers, a former mistress of Ulfeldt, to poison the royal family. Dina was convicted of perjury and executed, but Ulfeldt no longer felt secure at Copenhagen, and on the day after the execution he secretly quitted Denmark (July 14, 1651), with his family. After living for a time in concealment at Amsterdam, he migrated to Barth in Swedish Pomerania, and began the intrigues which have branded his name with infamy. In July 1657 he eagerly responded to the invitation of Charles X. of Sweden, when he invaded Denmark, and entered the service of his country's deadliest foe, for the express purpose of humiliating his sovereign and enriching himself. He persuaded the commandant of Nakskov, the one fortress of Laaland, to surrender to Charles X., and did his best to convince his countrymen that resistance was useless. Finally, as one of the Swedish negotiators at the congress of Taastrup, he was instrumental in humiliating his native land as she had never been humiliated before. Ulfeldt's treason was rewarded by Charles X. of Sweden with the countship of Solvitsburg in Blekinge; but the discontented renegade began intriguing against his new master, and in May 1659 was condemned to death. The Swedish regents, on the 7th of July, amnestied him, and he returned to Copenhagen to try to make his peace with his lawful sovereign, who promptly imprisoned him and his wife. In the summer of 1660 they were conveyed to Hammershus in Bornholm, as prisoners of state. Their captivity was severe to brutality; and they were only released (in September 1661) on the most degrading conditions. The fallen magnate henceforth dreamed of nothing but revenge, and in the course of 1662, during his residence at Bruges, he offered the Danish crown to the elector of Brandenburg, proposing to raise a rebellion in Denmark for that purpose. Frederick William betrayed Ulfeldt's treason to Frederick III., and the Danish government at once impeached the traitor; on the 24th of July 1663 he and his children were degraded, his property was confiscated, and he was condemned to be beheaded and quartered. He escaped from the country, but the sentence was actually carried out on his effigy; and a pillory was erected on the ruins of his mansion at Copenhagen. He died at Basel, in February 1664.

See Julius Albert Fridericia, *Adelsvaeldens sidste dage* (Copenhagen, 1894); *Danmarks riges historie*, vol. iv. (Copenhagen, 1897–1905); Robert Nisbet Bain, *Scandinavia*, chs. vii., ix., x. (Cambridge, 1905).

ULFILAS (*c.* 311–383), the apostle of Christianity to the Gothic race, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths of the trans-Danubian provinces about the year 311.[1] The Arian historian Philostorgius (*Hist. eccl.* ii. 5) says that his grand-parents were Christian captives from Sadagolthina in Cappadocia, who had been carried off to the lands beyond the Danube in the Gothic raid of 264, and became so naturalized that the boy received a Gothic name, *Wulfila* (Little Wolf).

[1] Krafft gives 313 as the date; Waitz, 318.

An authoritative record of the outlines of his life was only discovered early in the 19th century in a writing of Auxentius of Milan, his pupil and companion. At an early age Ulfilas was sent, either as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. During the preceding century Christianity had been planted sporadically among the Goths beyond the Danube, through the agency in part of Christian captives, many of whom belonged to the order of clergy, and in part of merchants and traders. Ulfilas may therefore have been a convert to Christianity when he reached Constantinople. But it was here probably that he came into contact with the Arian doctrines which gave the form to his later teaching, and here that he acquired his command over Greek and Latin. For some time before 341 he worked as a lector (reader of the Scriptures), probably among his own countrymen in Constantinople, or among those attached as *foederali* to the Imperial armies in Asia Minor. From this work he was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the bishops who were with him," probably at Antioch, in 341. This ordination of Ulfilas by the chiefs of the semi-Arian party is at once an indication of their determination to extend their influence by active missionary enterprise, and evidence that Ulfilas was now a declared adherent of the Arian or semi-Arian party. He was now thirty years of age, and his work as "bishop among the Goths" covered the remaining forty years of his life. For seven of these years he wrought among the Visigoths beyond the Danube, till the success which attended his labours drew down the persecution of the still pagan chief of the tribe. This "sacrilegus judex" has been identified with Athanaric, a later persecutor, but the identification is not beyond question. To save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people. With the consent of the emperor Constantius he led them across the Danube, "a great body of the faithful," and settled in Moesia at the foot of the range of Haemus and near the site of the modern Tirnova (349). Here they developed into a peace-loving pastoral people.

The life of Ulfilas during the following thirty-three years is marked by only one recorded incident (Sozomen iv. 24), his visit to Constantinople in January 360, to attend the council convened by the Arian or Homoean party. His work and influence were not confined to his own immediate flock, but radiated by means of his homilies and treatises, and through the disciples he despatched as missionaries, among all the Gothic tribes beyond the Danube. Thus the Church beyond the Danube, which had not been extinguished on Ulfilas's withdrawal, began to grow once more, and once more had to undergo the fires of persecution. Catholic missionaries had not been wanting in the meanwhile, and in the indiscriminate persecution by Athanaric, between 370 and 375, Catholics and Arians stood and fell side by side. The religious quarrel either accentuated, or was accentuated by, political differences, and the rival chiefs, Athanaric and Frithigern, appeared as champions of Paganism and Christianity respectively. Then followed the negotiations with the emperor Valens, the general adhesion of the Visigoths under Frithigern to Arian Christianity, the crossing of the Danube by himself and a host of his followers, and the troubles which culminated in the battle of Adrianople and the death of Valens (378). The part played by Ulfilas in these troublous times cannot be ascertained with certainty. It may have been he who, as a "presbyter christiani ritus," conducted negotiations with Valens before the battle of Adrianople; but that he headed a previous embassy asking for leave for the Visigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favoured by the emperor, and drew with him the whole body of his countrymen—these and other similar stories of the orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. Ulfilas lived long enough to see what the end must be. Hardships as well as years must have combined to make him an old man, when in 383 he was sent for to Constantinople by the emperor. A split seems to have taken place among the Arians at Constantinople. Ulfilas was summoned to meet the innovators, and to induce them to surrender the opinion which caused the dispute. His pupil Auxentius describes how, "in the name of God," he set out upon his way, hoping to prevent the teaching of these new heretics from reaching "the churches of Christ by Christ committed to his charge." No sooner had he reached Constantinople than he fell sick, "having pondered much about the council," and before he had put his hand to the task which had brought him he died, probably in January 383. A few days later there died, also in Constantinople, his old enemy and persecutor, Athanaric.

The Arianism of Ulfilas was a fact of pregnant consequence for his people, and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of his own confession—"Ego Ulfilas semper sic credidi." If, as seems probable from the circumstances of his ordination, he was a semi-Arian and a follower of Eusebius in 341, at a later period of his life he departed from this position, and vigorously opposed the teaching of his former leader. He appears to have joined the Homoean party, which took shape and acquired influence before the council of Constantinople in 360, where he adhered with the rest of the council to the creed of Ariminum, with the addendum that in future the terms *ὑπόστασις* and *οὐσία* should be excluded from Christological definitions. Thus we learn from Auxentius that he condemned Homoousians and Homoiousians alike, adopting for himself the Homoean formula, "filium similem esse patri suo." This Arian form of Christianity was imparted by Ulfilas and his disciples to most of the tribes of the Gothic stock, and persisted among them, in spite of persecution, for two centuries.

The other legacy bequeathed by Ulfilas was of less questionable value. His version of the Scriptures is his greatest monument. By it he became the first to raise a barbarian tongue to the dignity of a literary language; and the skill, knowledge and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work.

The personal qualities of the man may be inferred from his pupil's description of him as "of most upright conversation, truly a confessor of Christ, a teacher of piety, and a preacher of truth—a man whom I am not competent to praise according to his merit, yet altogether keep silent I dare not."

(C. A. S.)

ULLATHORNE, WILLIAM BERNARD (1806–1889), English Roman Catholic bishop, was born at Pocklington, Yorkshire, on the 7th of May 1806, of an old Roman Catholic family. At fifteen he went to sea, and made several voyages to the Baltic and Mediterranean. In 1823 he entered the Benedictine monastery of Downside, near Bath, taking the vows in 1825. He was ordained priest in 1831, and in 1833 went to New South Wales, as vicar-general to Bishop William Morris (1794–1872), whose jurisdiction extended over the Australian missions. It was mainly Ullathorne who caused Gregory XVI. to establish the hierarchy in Australia. He returned to England in 1836, and, after another visit to Australia, settled in England in 1841, taking charge of the Roman Catholic mission at Coventry. He was consecrated bishop in 1847 as vicar-apostolic of the western district, in succession to Bishop C. M. Baggs (1806–1845), but was transferred to the central district in the following year. On the re-establishment of the hierarchy in England Ullathorne became the first Roman Catholic bishop of Birmingham. During his thirty-eight years tenure of the see 67 new churches, 32 convents and nearly 200 mission schools were built. In 1888 he retired and received from Leo XIII. the honorary title of archbishop of Cabasa. He died at Oscott College on the 21st of March 1889.

Of his theological and philosophical works the best known are: *The Endowments of Man* (1882); *The Groundwork of the Christian Virtues* (1883); *Christian Patience* (1886). For an account of his life see his *Autobiography*, edited by A. T. Drane (London, 1891).

ULLMANN, KARL (1796–1865), German Protestant theologian, was born at Epfenbach, near Heidelberg, on the 15th of

March 1796. He studied at Heidelberg and Tübingen, and in 1820 delivered exegetical and historical lectures at Heidelberg. In 1829 he went to Halle as professor to teach church history, dogmatics and symbolics, but in 1836 he accepted a chair at Heidelberg. A lifelong exponent of the mediating theology (*Vermittelungs-Theologie*), in 1828, with the help of Umbreit (1795–1860), he founded and edited the *Theologische Studien und Kritiken* in its interests. When Wegscheider and Gesenius were denounced by Hengstenberg as rationalists, he pleaded for freedom in theological teaching (cf. his *Theol. Bedenken*, 1830). On the other hand, he vigorously attacked David Strauss. His *Historisch oder mythisch* (1838; 2nd ed. 1866) was a reply to Strauss's *Life of Jesus*, and his criticism resulted in Strauss making numerous concessions in later works. Ullmann died on the 12th of January 1865.

In *Das Wesen des Christenthums* (1845; 5th ed., 1865; Eng. trans., 1860) Ullmann explains that Christianity is independent of the orthodox formulas, and contends that a distinction should be made between faith and dogmatics. His principal historical works are *Gregor von Nazianz* (1825; 2nd ed., 1867) and *Die Reformatoren vor der Reformation* (2 vols., 1841; 2nd ed., 1866; Eng. trans., 1854). Another well-known work is *Die Sündlosigkeit Jesu* (1854; Eng. trans., 1858 and 1870). See O. Pfleiderer, *Development of Theology* (1890); and cf. W. Beyschlag, *Karl Ullmann* (1867), and Adolf Hausrath in *Kleine Schriften religionsgeschichtlichen Inhalts* (1883).

ULM, a fortress-city of Germany, in the kingdom of Württemberg, situated on the left bank of the Danube, in a fertile plain at the foot of the Swabian Alps, 58 m. by rail S.E. of Stuttgart and 63 m. N.W. of Munich. Pop. (1905), 51,680. Ulm still preserves the dignified and old-fashioned appearance of a free imperial town, and contains many medieval buildings of historic and of artistic interest. Among these are the town hall, of the 16th century, in the Transition style from late Gothic to Renaissance, restored in recent years; the Kornhaus; the Ehingerhaus or Neubronnerhaus, now containing the industrial museum; and the commandery of the Teutonic order, built in 1712–1718 on the site of a habitation of the order dating from the 13th century, and now used as barracks. The magnificent early Gothic cathedral is capable of containing 30,000 people. Begun in 1377, and carried on at intervals till the 16th century, the building was long left unfinished; but in 1844 the work of restoration and completion was begun, being completed in 1890. Ulm cathedral has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 ft., its breadth 159 ft.; the nave is 136 ft. high and 47½ wide; the aisles, which are covered with rich net-vaulting, are 68 ft. in height. The massive and richly decorated square tower in the centre of the west façade, which for centuries terminated in a temporary spire, was completed in 1890, according to the original plans, by the addition of an octagonal storey and a tall open spire (528 ft.), the loftiest ecclesiastical erection in the world, outstripping the twin spires of Cologne cathedral by 21 ft. The towers of the choir, rebuilt in the course of the restoration, are 282 ft. high. The cathedral contains some fine stained glass, the largest organ in Germany (1856), and a number of interesting old paintings and carvings by Jörg Syrlin the elder, Jörg Syrlin the younger, Burkhard Engelberger, and other masters of the Swabian school. It belongs to the Protestant Church. Trinity church dates from 1617–1621, and there are also four Roman Catholic churches and a synagogue.

The Danube, joined by the Iller just above the town and by the Blau just below, here becomes navigable, so that Ulm occupies the important commercial position of a terminal river-port. Hence there is water communication with the Neckar, and so to the Rhine and into the interior of France. The market for leather and cloth is important, and Ulm is famous for its vegetables (especially asparagus), barley, beer, pipe-bowls and sweet cakes (Ulmer Zuckerbrot). Bleaching, brewing and brass-founding are carried on, as well as a large miscellany of manufactures.

Ulm has long been a fortress of the first rank. In 1844–1859 the German Confederation carefully fortified it, and in 1876 the new German Empire added a comprehensive outer girdle of detached forts, culminating in the powerful citadel of Wilhelmsburg. The long straight lines of works which stretched to the plateau of the Michelsberg and formed the outworks of the main fortress on the left bank of the Danube were purchased in 1900 by the municipal authorities, in order to be levelled and laid out in streets for the extension of the town in this direction. The fortifications also of Neu-Ulm, on the Bavarian side of the Danube, were ordered to be razed and devoted to municipal purposes. The citadel of Wilhelmsburg remains, and also the defences on the left bank of the Danube, further extended and strengthened. Ulm is the basis of operations for the German army behind the Black Forest, and can easily shelter a force of 100,000 men; its peace garrison is 5600.

Ulm is mentioned as early as 854, and under the Carolingian sovereigns it was the scene of several assemblies. It became a town in 1027, and was soon the principal place in the duchy of Swabia. Although burned down by Henry the Lion, it soon recovered from this disaster and became a free imperial town in 1155. Towards the close of the middle ages it appears several times at the head of leagues of the Swabian towns. Its trade and commerce prospered and in the 15th century it attained the summit of its prosperity, ruling over a district about 300 sq. m. in extent, and having a population of about 60,000. In 1803 it lost its freedom and passed to Bavaria, being ceded to Württemberg in 1809. In October 1805 General Mack with 23,000 Austrians capitulated here to Napoleon. Ulm is remarkable in the history of German literature as the spot where the Meistersinger lingered longest, preserving without text and without notes the traditional lore of their craft. In 1830 there were twelve Meistersinger alive in Ulm, but in 1839 the four survivors formally made over their insignia and gild property to a modern singing society and closed the record of the *Meistergesang* in Germany.

Fischer, *Geschichte der Stadt Ulm* (Stuttgart, 1863); Pressel, *Ulmisches Urkundenbuch* (Stuttgart, 1873); and *Ulm und sein Münster* (Ulm, 1877); Schultes, *Chronik von Ulm* (Stuttgart, 1881 and 1886); Hassler, *Ulms Kunstgeschichte im Mittelalter* (Stuttgart, 1872); and *Das rote Buch der Stadt Ulm*, edited by C. Mollvo (1904).

ULPIAN (Domitius Ulpianus), Roman jurist, was of Tyrian ancestry. The time and place of his birth are unknown, but the period of his literary activity was between A.D. 211 and 222. He made his first appearance in public life as assessor in the *auditorium* of Papinian and member of the council of Septimius Severus; under Caracalla he was master of the requests (*magister libellorum*). Heliogabalus banished him from Rome, but on the accession of Alexander (222) he was reinstated, and finally became the emperor's chief adviser and *praefectus praetorio*. His curtailment of the privileges granted to the praetorian guard by Heliogabalus provoked their enmity, and he narrowly escaped their vengeance; ultimately, in 228, he was murdered in the palace, in the course of a riot between the soldiers and the mob.

His works include *Ad Sabinum*, a commentary on the *jus civile*, in over 50 books; *Ad edictum*, a commentary on the Edict, in 83 books; collections of opinions, responses and disputations; books of rules and institutions; treatises on the functions of the different magistrates—one of them, the *De officio proconsulis libri x.*, being a comprehensive exposition of the criminal law; monographs on various statutes, on testamentary trusts, and a variety of other works. His writings altogether have supplied to Justinian's *Digest* about a third of its contents, and his commentary on the Edict alone about a fifth. As an author he is characterized by doctrinal exposition of a high order, judiciousness of criticism, and lucidity of arrangement, style and language.

Domitii Ulpiani fragmenta, consisting of 29 titles, were first edited by Tilius (Paris, 1549). Other editions are by Hugo (Berlin, 1834), Böcking (Bonn, 1836), containing fragments of the first book of the *Institutiones* discovered by Endlicher at Vienna in 1835, and in Girard's *Textes de droit romain* (Paris, 1890).

ULRICH, duke of Württemberg (1487–1550), was a son of Henry, count of Montbéliard (d. 1519), younger son of Ulrich V., count of Württemberg. He succeeded his kinsman Eberhard II. as duke of Württemberg in 1498, being declared of age in 1503. He served the German king, Maximilian I., in the war over the succession to the duchy of Bavaria-Landshut in 1504, receiving some additions to Württemberg as a reward; he accompanied Maximilian on his unfinished journey to Rome in 1508; and he marched with the imperial army into France in 1513. Meanwhile in Württemberg Ulrich had become very unpopular. His extravagance had led to a large accumulation of debt, and bis subjects were irritated by his oppressive methods of raising money. In 1514 a rising under the name of "poor Conrad" broke out, and was only suppressed after Ulrich had made important concessions to the estates in return for financial aid. The duke's relations with the Swabian league, moreover, were very bad, and trouble soon came from another quarter also. In 1511 Ulrich had married Sabina, a daughter of Albert III., duke of Bavaria-Munich, and niece of the emperor Maximilian. The marriage was a very unhappy one, and having formed an affection for the wife of a knight named Hans von Hutten, a kinsman of Ulrich von Hutten, the duke killed Hans in 1515 during an altercation. Hutten's friends now joined the other elements of discontent. Fleeing from her husband, Sabina won the support of the emperor and of her brother William IV., duke of Bavaria, and Ulrich was twice placed under the imperial ban. After the death of Maximilian in January 1519 the Swabian league interfered in the struggle, and Ulrich was driven from Württemberg, which was afterwards sold by the league to the emperor Charles V.

Ulrich passed some time in Switzerland, France and Germany, occupied with brigand exploits and in service under Francis I. of France; but he never lost sight of the possibility of recovering Württemberg, and about 1523 he announced his conversion to the reformed faith. His opportunity came with the outbreak of the Peasants' War. Posing as the friend of the lower orders and signing himself "Ulrich the peasant," his former oppressions were forgotten and his return was anticipated with joy. Collecting men and money, mainly in France and Switzerland, he invaded Württemberg in February 1525, but the Swiss in his service were recalled owing to the defeat of Francis I. of France at Pavia; the peasantry were unable to give him any serious support, and in a few weeks he was again a fugitive. During his exile Ulrich had formed a friendship with Philip, landgrave of Hesse; and his restoration, undertaken by Philip, is an event of some importance in the political history of the Reformation. In 1526 Philip had declared he was anxious to restore the exiled duke, and about the same time Francis I. and Zwingli had intimated their willingness to assist in a general attack upon the Habsburgs. Many difficulties, however, barred the way, and it was 1534 before Philip was prepared to strike. In January of that year Francis I. had definitely promised assistance; the Swabian league had just been dissolved; and, after a manifesto had been issued by Ulrich and Philip justifying the proposed undertaking, Württemberg was invaded in April 1534. Charles V. and his brother, the German king, Ferdinand I., could send but little assistance to their lieutenants, and on the 13th of May the troops of the Habsburgs were completely defeated at Lauffen. In a few weeks Ulrich was restored, and in June 1534 a treaty was negotiated at Kaaden by which he was recognized as duke by Ferdinand, but was to hold Württemberg under Austrian suzerainty. After some hesitation Ulrich yielded to the solicitations of Philip, and signed the treaty in February 1535.

The duke now lost no time in pressing on the teaching of the reformed doctrines of Luther and Zwingli. Many convents and monasteries were destroyed, and extensive seizures of church property formed a welcome addition to his impoverished exchequer. Taxation, however, was so heavy that he soon lost his temporary popularity. In April 1536 he joined the league of Schmalkalden, though he did not assent to some of the schemes of Philip of Hesse for attacking Charles V. In 1546 his troops fought against the emperor during the war of the league of Schmalkalden, but with disastrous results for Württemberg. The duchy was quickly overrun, and the duke compelled to agree to the treaty of Heilbronn in January 1547. By this treaty Charles, ignoring the desire of Ferdinand to depose Ulrich again, allowed him to retain his duchy, but stipulated that he should pay a large sum of money, surrender certain fortresses, and appear as a suppliant before the emperor at Ulm. Having submitted under compulsion to the *Interim* issued from Augsburg in May 1548, Ulrich died on the 6th of November 1550 at Tübingen, where he was buried. He left a son, Christopher (1515–1568), who succeeded him.

ULRICI, HERMANN (1806–1884), German philosopher, was born at Pförten, Prussia, on the 23rd of March 1806. He was educated for the law, but gave up his profession on the death of his father, and devoted four years to the study of literature, philosophy and science. In 1834 he was called to a professorship at Halle, where he remained till his death, on the 11th of January 1884. His philosophical standpoint may be characterized as a reaction from the pantheistic tendency of Hegel's idealistic rationalism towards a more pronouncedly theistic position. The Hegelian identity of being and thought is also abandoned and the truth of realism acknowledged, an attempt being made to exhibit idealism and realism as respectively incomplete but mutually complementary systems. Ulrici's later works, while expressing the same views, are largely occupied in proving the existence of God and the soul from the basis of scientific conceptions, and in opposition to the materialistic current of thought then popular in Germany.

His first works were in the sphere of literary criticism; of his treatise *On Shakespeare's Dramatic Art* (1839; editions, 1847, 1868, 1874), the 3rd ed. was translated into English by L. D. Schmitz in 1876. In 1841 he published *Über Princip u. Methode der Hegelschen Philosophie*, a severe criticism of the Hegelian system. This was continued in the *Grundprincip der Philosophie* (1845–1846), which also gives his speculative position. Complementary to this is his *System der Logik* (1852). His later works on the relation of philosophy to science and to the thought of his time were more popular in character. These are *Glauben u. Wissen* (1858), *Gott u. die Natur* (1862; 3rd ed., 1875), *Gott und der Mensch* (2 vols., 1866–1873; 2nd ed., 1874). From 1847 onward Ulrici edited, jointly with the younger Fichte, the *Zeitschrift für Philosophie u. phil. Kritik*. See Fränkel's art. in *Allgemeine deutsche Biog.* (1895) and works there quoted.

ULSTER, EARLS OF. The earldom of Ulster was the first title of honour in Ireland of English creation, and for more than a century was the only one. By many authorities John de Courci (*q.v.*), the conqueror of Ulster, is held to have been the first earl of Ulster; "it is, however, certain," says J.H. Round, "that this title was the invention of a late chronicler, and that it first appears in the *Book of Howth*, where we read of "Sir John Courcey, earl and president of Ulster." The confusion probably arose from the words of a charter, dated the 29th of May 1205, by which King John confirmed to Hugh de Lacy, whom he then created earl of Ulster, a grant of Ulster "as John de Courci held it on the day when Hugh conquered and took him prisoner in the field"; these words referring not to the earldom but to the lands held by de Courci, and possibly also to the authority which he had exercised in the king's name. The earldom therefore dates from this grant to de Lacy in 1205.

Hugh de Lacy, 1st Earl of Ulster (d. 1242 ?), was descended from Walter de Lacy (d. 1085), who fought for William the Conqueror at Hastings. The family came from Lassy in Normandy, and after the Conquest Walter de Lacy obtained extensive grants of land on the Welsh marches. He was the first baron Lacy by tenure, and was probably a brother, certainly a kinsman, of Ilbert de Lacy, from whom were descended Roger de Lacy, justiciar in the reign of King John, and the earls of Lincoln (*q.v.*) of the de Lacy family. Although Walter had three sons, one of whom founded Llanthony Abbey, none of them left heirs; but his daughter's son Gilbert took the name of de Lacy and became the fourth baron. Gilbert's son Hugh de Lacy (d. 1186) was one of the barons who accompanied Henry II. to Ireland in 1171; he obtained a grant of Meath, and governed Ireland as vicegerent for the king. By his wife Rose of Monmouth Hugh was father of Walter de Lacy (d. 1241), who succeeded his father as lord of Meath and took a leading part in the conflict of his family with John de Courci in Ireland, and also of Hugh de Lacy, 1st earl of Ulster. The latter was for a time a coadjutor of de Courci in Leinster and Munster, but after 1200 the rivalry between the two developed into war, and in 1203 de Lacy drove de Courci out of Down, and in the following year took him prisoner. He was rewarded by the king with grants of land in Ulster and Connaught, which were confirmed by the charter of the 29th of May 1205, when Hugh was created earl. He returned to Ireland with quasi-viceregal authority, and endeavoured without much success to reduce the O'Neill of Tyrone to submission. In 1207 war broke out between the earl of Ulster and FitzHenry, the justiciar. This brought King John in person to Ireland, where he expelled the earl's brother, Walter de Lacy, from Meath, and compelled the earl himself to fly from Carrickfergus to Scotland. For several years Ulster took part in the wars in France, and he did not return to Ireland till 1221, when he allied himself with O'Neill against the English. In 1226 his lands in Ulster were handed over to his brother Walter, but were restored to him in the following year, after which date he appears to have loyally served the king, being more than once summoned to England to give advice about Irish affairs. He died at Carrickfergus in 1242 or 1243. He left no surviving legitimate children, and on his death the earldom of Ulster reverted to the Crown.

In 1254 the lordship of Ireland was granted by Henry III. to Prince Edward (afterwards Edward I.), who about 1255 transferred "the county of Ulster" to Walter de Burgh, lord of Connaught, in exchange for the rich domain of Kilsilan. De Burgh was henceforth, or at all events within a short time afterwards, styled earl of Ulster, to which title he may have advanced some hereditary claim of a loose order through his mother Egidia, daughter of Walter de Lacy, the first earl of Ulster's brother. The earldom remained in the family of De Burgh until the death of William, 3rd earl of this line, in 1333, when it passed to his daughter Elizabeth, who married Lionel Plantagenet, son of Edward III. Lionel, having inherited in right of his wife the great estates of the family of de Clare as well as those of de Burgh, was created duke of Clarence in 1362. Leaving no male heirs, Lionel was succeeded in the earldom of Ulster by his daughter Philippa, who married Edmund Mortimer, earl of March. The third Mortimer, earl of Ulster, died unmarried in 1425, when his titles were inherited by his sister's son, Richard Plantagenet, duke of York, whose son Edward ascended the throne as Edward IV. in 1461.

Since that date the earldom of Ulster, which then merged in the Crown, has only been held by members of the royal family. It was granted in 1659 to James, duke of York, second son of Charles I., on whose accession as James II. it again merged in the Crown. The next prince to bear the title (1716) was Ernest Augustus, duke of Brunswick-Lüneburg, son of the elector of Hanover, and youngest brother of George I. The title became extinct at his death without heirs in 1728. It was next conferred on Edward Augustus, brother of George III., in 1760, again becoming extinct at his death seven years later. In 1784 Prince Frederick, second son of George III., was created earl of Ulster, and died leaving no children in 1827. Each of these last four earls of Ulster, all being of separate creations, held the title in conjunction with the dukedoms of York and Albany. On the next occasion of its revival it was united with the dukedom of Edinburgh, Prince Alfred Ernest Albert, second son of Queen Victoria, being created duke of Edinburgh, earl of Kent and earl of Ulster in 1866. On the death of the duke of Edinburgh in 1900 the earldom became extinct.

O'Donovan (7 vols., Dublin, 1851); The *Annals of Loch Cé*, edited by W. M. Hennessy, "Rolls Series" (2 vols., London, 1871); *Calendar of Documents Relating to Ireland*, edited by H. S. Sweetman (5 vols., London, 1875–1886); W. W. Shirley, *Royal and Historical Letters of the Reign of Henry III.*, "Rolls Series" (2 vols., London, 1862–1866); Sir J. T. Gilbert, *History of the Viceroys of Ireland* (Dublin, 1865). For the later history of the earldom see G. E. C., *Complete Peerage*, vol. viii. (London, 1898). (R. J. M.)

ULSTER, a province of Ireland occupying the northern part of the island. It includes the counties Donegal, Londonderry, Antrim, Fermanagh, Tyrone, Cavan, Monaghan, Armagh and Down. Ulster (*Uladh*) was one of the early provincial kingdoms of Ireland, formed, according to the legendary chronicles, at the Milesian conquest of the island ten centuries before Christ, and given to the descendants of Ir, one of the sons of Mileadh. Interprovincial wars frequently altered its boundaries, notably in 332 when the three Collas, sons of Eochaidh Doimhlein, conquered the land between the river Boyne and Lough Neagh, which became a separate kingdom under the name of Uriel (Oriel or Orgial). Its princes maintained themselves until the close of the 16th century. In 1177 John de Courci, with the countenance of Henry II., set out to the conquest of Ulster. His operations were gradually successful, and he became lord deputy of Ireland in 1186 (see above). The nominal reign of the last king of Ulster closed in 1200. In 1585 Lord Deputy Sir John Perrot undertook the shiring of Ulster (excluding the counties Antrim and Down, which had already taken shape); and his work, though of little immediate effect owing to the rising of Hugh O'Neill, served as a basis for the division of the territory at the plantation of Ulster in the reign of James I.

ULTIMATUM (from Lat. *ultimus*, last), a word used in diplomacy to signify the final terms submitted by one of the parties in negotiation for settlement of any subject of disagreement. It is accompanied by an intimation as to how refusal will be regarded. English diplomacy has devised the adroit reservation that refusal will be regarded as an "unfriendly act," a phrase which serves as a warning that the consequences of the rupture of negotiations will be considered from the point of view of forcing a settlement. This opens up a variety of possibilities, such as good offices, mediation, the appointment of a commission of inquiry, arbitration, reprisals, pacific blockade and war.[1]

As regards the alternative of war, the Hague convention relative to the Opening of Hostilities of the 18th of October 1907, provides as follows:—

"Considering that it is important, in order to ensure the maintenances of pacific relations, that hostilities should not commence without previous warning," it is agreed by the Contracting Powers to "recognize that hostilities between them must not commence without a previous and explicit warning in the form of either a declaration of war, giving reasons, or an ultimatum with a conditional declaration of war."

As reasons for a declaration of war are necessarily in the nature of an ultimatum, the ultimatum may now be regarded as an indispensable formality precedent to the outbreak of hostilities.

Another Hague convention of the same date respecting the limitation of the employment of force for the recovery of contract debts provides as follows:—

"Being desirous of preventing between nations armed conflicts originating in a pecuniary dispute respecting contract debts claimed from the government of one country by the government of another country as due to its subjects or citizens," the Contracting Powers agree "not to have recourse to armed force for the recovery of contract debts claimed from the government of one country by the government of another country as being due to its subjects or citizens."

This undertaking, however, is not applicable when the debtor

[1] To these may be added a new unofficial method devised by the Turks in connexion with the Austro-Turkish difficulty over the annexation of Bosnia-Herzegovina, viz. the boycotting of the goods and ships of the natives of the state against which the grievance exists. This is a method open to weaker as against more powerful states, which can have serious coercive and even complicated consequences under the influence of democratic institutions.

state refuses or neglects to reply to an offer of arbitration or, "after accepting the offer, renders the settlement of the *compromis* impossible, or, after the arbitration, fails to comply with the award."

Under this convention, in the cases to which it relates, the alternative of the ultimatum is *ipso facto* arbitration, and it is only when the conditions of the convention have been set at naught that other measures may be employed.

ULTRAMARINE, a blue pigment, consisting essentially of a double silicate of aluminium and sodium with some sulphides or sulphates, and occurring in nature as a proximate component of lapis lazuli (*q.v.*). As early at least as the 11th century the art of extracting a blue pigment from lapis lazuli was practised, and from the beginning of the 16th century this pigment began to be imported into Europe from "over the sea," as *azurrum ultramarinum.* As the mineral only yields from 2 to 3% of the pigment, it is not surprising to learn that the pigment used to be weighed up with gold. It was valued chiefly on account of its brilliancy of tone and its inertness in opposition to sunlight, oil, and slaked lime (in fresco-painting). In 1814 Tassaert observed the spontaneous formation of a blue compound, very similar to ultramarine, if not identical with it, in a soda-furnace at St Gobain, which caused the *Société pour l'Encouragement d'Industrie* to offer, in 1824, a prize for the artificial production of the precious colour. Processes were devised by Guimet (1826) and by Christian Gmelin (1828), then professor of chemistry in Tübingen; but while Guimet kept his process a secret Gmelin published his, and thus became the originator of the "artificial ultramarine" industry.

The details of the commercial processes are trade secrets. The raw materials used in the manufacture are: (1) iron-free kaolin, or some other kind of pure clay, which should contain its silica and alumina as nearly as possible in the proportion of $2SiO_2 : Al_2O_3$ demanded by the formula assigned to ideal kaolin (a deficit of silica, however, it appears can be made up for by addition of the calculated weight of finely divided silica); (2) anhydrous sulphate of soda; (3) anhydrous carbonate of soda; (4) sulphur (in the state of powder); and (5) powdered charcoal or relatively ash-free coal, or colophony in lumps. "Ultramarine poor in silica" is obtained by fusing a mixture of soft clay, sodium sulphate, charcoal, soda and sulphur. The product is at first white, but soon turns green ("green ultramarine") when it is mixed with sulphur and heated. The sulphur fires, and a fine blue pigment is obtained. "Ultramarine rich in silica" is generally obtained by heating a mixture of pure clay, very fine white sand, sulphur and charcoal in a muffle-furnace. A blue product is obtained at once, but a red tinge often results. The different ultramarines—green, blue, red and violet—are finely ground and washed with water.

Artificial, like natural, ultramarine has a magnificent blue colour, which is not affected by light nor by contact with oil or lime as used in painting. Hydrochloric acid at once bleaches it with liberation of sulphuretted hydrogen and milk of sulphur. It is remarkable that even a small addition of zinc-white (oxide of zinc) to the reddish varieties especially causes a considerable diminution in the intensity of the colour, while dilution with artificial precipitated sulphate of lime ("annalin") or sulphate of baryta ("blanc fix") acts pretty much as one would expect. Ultramarine being very cheap, it is largely used for wall painting, the printing of paperhangings and calico, &c., and also as a corrective for the yellowish tinge often present in things meant to be white, such as linen, paper, &c. Large quantities are used in the manufacture of paper, and especially for producing that kind of pale blue writing paper which is so popular in Great Britain. The composition of the pigment is quite similar to that of lapis lazuli; but the constitution of both is uncertain.

By treating blue ultramarine with silver nitrate solution, "silver-ultramarine" is obtained as a yellow powder. This compound gives a blue potassium- and lithium-ultramarine when treated with the corresponding chloride, and an ethyl-ultramarine when treated with ethyl iodide. Selenium- and tellurium-ultramarine, in which these elements replace the sulphur, have also been prepared. It has been suggested that ultramarine is a compound of a sodium aluminium silicate and sodium sulphide. Another view is that the colour is due to some comparatively simple substance suspended in a colourless medium.

ULTRAMONTANISM (Lat. *ultra*, beyond, *montes*, the mountains), the name given to a certain school of opinion in the Roman Catholic Church. The expression *ultramontane* was originally no more than a term of locality, characterizing the persons so described as living—or derived from—"beyond the mountains." The "mountains" in this case are the Alps, so that, from the Italian standpoint, Germans and French for instance were "ultramontane." In this sense the word was applied in the later middle ages to the Germans studying at Italian universities and—to take a particular example—to the French cardinals at the election of Clement V. (1305). North of the Alps, however, the term seems never to have been restricted to the sense implying locality; for from the very beginning we find it used as a party appellation to describe those who looked "beyond the mountains" in order to obtain a lead from Rome, who represented the papal point of view and supported the papal policy. Thus, as early as the 11th century, the partisans of Gregory VII. were styled ultramontanes, and from the 15th century onwards the same name was given to the opponents of the Gallican movement in France.

It was not until the 19th century that "ultramontane" and "ultramontanism" came into general use as broad designations covering the characteristics of particular personalities, measures and phenomena within the Roman Catholic Church. At the present time they are applied to a tendency representing a definite form of Catholicism within that Church; and this tendency, in spite of the individual forms it has assumed in different countries, everywhere displays the same essential features and pursues the same ends. It follows, to be sure, from the very nature of Ultramontanism, and from the important position to which it has attained, that the official organs of the Church and all the people interested in the continuance of the actual state of affairs deny that it exists at all as an independent tendency, and seek to identify it with any proper interpretation of Roman Catholicism. Numerous Catholics, on the other hand, well qualified to form a judgment, themselves protest against this obliteration of the dividing line. It is indisputably legitimate to speak of Ultramontanism as a distinct policy, but it is very difficult to define its essential character. For, true to its nature, it has itself drawn up no complete programme of its objects, and, in addition to its avowed aims, its subsidiary effects claim attention. There is something chameleon-like in its appearances; its genuine views are kept in the background from tactical considerations, and first one aspect, then another, comes into prominence. It is evident, therefore, that the request for a definition of Ultramontanism cannot be answered with a concise formula, but that the varied character of its manifestations necessitates a more detailed examination of its peculiar objects.

The indications given by the late Franz Xaver Kraus—himself a Catholic—may well serve for a guide (*Spectator*, ep. 2). He classes as Ultramontane: (1) Whoever places the idea of the Church above that of religion; (2) whoever confounds the pope with the Church; (3) whoever believes that the kingdom of Heaven is of this world, and maintains, with medieval Catholicism, that the power of the keys, conferred on Peter, includes secular jurisdiction over princes and nations; (4) whoever holds that religious conviction can be imposed by material force, or may legitimately be crushed by it; (5) whoever is always ready to sacrifice a clear injunction of his own conscience to the claims of an alien authority.

The first and fundamental characteristic of Ultramontanism is its championship of a logical carrying out of the so-called "papalistic system," the concentration, that is, of all ecclesiastical power in the person of the Roman bishop. This tendency among occupants of the Roman see to exalt themselves above other bishops, and to usurp the part of a superior authority as compared with them, may be traced even in antiquity. No later than the end of the 2nd century Bishop Victor made an attempt to establish this position during the discussions regarding the date of the Easter festival. But he met with a sharp rebuff, and Bishop Stephen fared no better when, in the middle of the 3rd century, he came into collision with Cyprian of Carthage and Firmilian of Caesarea in the dispute concerning heretical baptism. How the Roman bishopric rose in status till it became the papacy, how the individual popes—in spite of these and similar repulses—advanced steadily on their path, how they succeeded in founding their primacy within the Church, and in re-establishing and maintaining that primacy notwithstanding severe defeats and long periods in which their prestige sank to the vanishing point, is told elsewhere (see PAPACY). A characteristic peculiarity of the process is that the claims of the Roman see were always in advance of the actual facts and always encountered opposition; though there were many periods—at the height of the middle ages, for instance—when the voices raised in protest were only timid and hesitating. To the curial system, so evolved, and continually fortifying its position in the domains of theology, ecclesiastical law and politics, the episcopal system stands in diametrical opposition. This system admits that the pope represents the unity of the Church, and acknowledges his primacy, but only in the sense that he is *primus inter pares*; while at the same time it claims on behalf of the bishops that, in virtue of the divine ordinance, they possess an inalienable right to a share in the government of the Church (see EPISCOPACY). This theory of the independence of the episcopate with regard to the Roman bishop was first propounded by Cyprian, in his treatise *De unitate ecclesiae*. In the 15th century it received its classical expression in the resolutions of the ecumenical council at Constance; its principles were developed and amplified by Gallicanism, and, finally, in the 18th century, was restored in a modernized form by "Febronius" (Nikolaus von Hontheim, *q.v.*) and in the Punctation of Ems (see FEBRONIANISM). The struggle between these two systems continued well into the 19th century; and, though episcopalism was not infrequently proscribed by the curia, it still survived, and till the year 1870 could boast that no ecumenical council had ventured to condemn it. This was done for the first time, in 1870, at the Vatican Council (*q.v.*), whose decrees, recognizing the universal episcopate and the infallibility of the pope, marked the triumph of that ultramontane doctrine by which they had been long anticipated.

In 1865 Döllinger wrote: "The Ultramontane view can be summarized in a single, concise, and luminous proposition; but out of this proposition are evolved a doctrine and a view that embrace not merely religion and the Church, but science and the state, politics, morals and the social order—in a word, the whole intellectual life of men and nations. The proposition runs: The pope is the supreme, the infallible, and consequently the sole authority in all that concerns religion, the Church, and morality, and each of his utterances on these topics demands unconditional submission—internal no less than external." History, since the Vatican Council, has shown this judgment to have been correct. The Roman Catholic Church, in all countries, has become more and more dependent on the Curia: the bishops have lost their autonomous standing, and their position is little more than that of papal delegates, while all important questions are referred to Rome or settled by the nuncios.

A second peculiarity of Ultramontanism is its confusion of religion with politics; it claims for the Roman Catholic Church the functions of a political power, and asserts that it is the duty of the secular state to carry out its instructions and wishes. Ultramontanism regards the state, not as a divinely established order but, like its ancient prototype, as a profane institution and, for that reason, not co-ordinate with, but subordinate to the Church.

Since the conditions of the age no longer allow the pope to depose a temporal sovereign, the practical application of this conception of the relationship between the spiritual and temporal powers has taken other forms, all of which, however, clearly show that the superiority of the Church over the state is assumed. This may be seen in the attitude of Ultramontanism towards secular law. It assumes that God has conferred on the individual and on society certain rights and competences as inalienable possessions. This "natural law" ranks above all secular law, and all state legislation is binding only in so far as it is in harmony with that law. As to the provisions of this natural law, and the consequences they entail in individual cases, these can be decided only by the Church, *i.e.* the last resort, by the pope. This is to assert the principle of the invalidity of all legislation conflicting with ecclesiastical interests and rules. This was the attitude of Innocent III. when he annulled the English Magna Charta; of Innocent X. when he pronounced the treaty of Westphalia null and void; of Pius IX. when he condemned the Austrian constitution (1868) and the ecclesiastical laws of Prussia so far as they affected the circumstances of the Roman Catholic Church (1875). Thus, too, even at the present time, the opinion is very clearly expressed in Ultramontane quarters that, in the event of the state issuing laws contravening those of nature or of the Church, obedience must be refused. The attitude of Ultramontanism, for instance, towards the right claimed and exercised by the state to make laws concerning marriage is wholly negative; for it recognizes no marriage laws except those of the Church, the Church alone being regarded as competent to decide what impediments are a bar to marriage, and to exercise jurisdiction over such cases. Thus Ultramontanism disclaims any moral subjection to secular authority or law, and will recognize the state only in so far as it conforms its rules to those of the Church. An instance of this interference with the duties of the individual citizen towards the state may be found in the fact that, till the year 1904, the Catholics of Italy were prohibited by the pope from taking part in any parliamentary election.

Since Ultramontanism cannot hope to realise its political ambitions unless it succeeds in controlling the intellectual and religious life of Catholic Christendom, it attempts to extend its sphere of influence in all directions over culture, science, education, literature and the forms taken by devotion. This endeavour is the third great characteristic of Ultramontanism. Wherever its operations can be traced, they are dominated by the conviction that all stirrings of independence must be repressed, and any advance beyond the stage of immaturity and nonage checked at the outset. That science must be left free to determine the aims of her investigation, to select and apply her own methods, and to publish the results of her researches without restraint, is a postulate which Ultramontanism either cannot understand or treats with indifference, for it regards as strange and incredible the fundamental law governing all scientific research—that there is for it no higher aim than the discovery of the truth. This ignorance of the very nature of science leads to under-estimation of the elemental force which science possesses; for only thus can we explain the pertinacity with which Ultramontanism, even at the present day, strives to subject her work to its own censorship and control. Nor are its criticisms limited to theology alone: its care extends to philosophy, history and the natural sciences. Even medicine has not escaped its vigilance, as is proved by the prohibition of certain surgical operations. The development of these efforts may be easily traced from decisions of the Congregation of the Index and the Holy Office in Rome. Ultramontanism, too, labours systematically to bring the whole educational organization under ecclesiastical supervision and guidance; and it manifests the greatest repugnance to allowing the future priest to come into touch with the modern spirit. Hence the attempts to train its growing manhood in clerically regulated boarding-schools and to keep it shut out from the external world in clerical seminaries, even in places where there are universities. Again, it works zealously to bring the elementary schools under the sway of the Church. Since it regards the training and instruction of childhood as inseparable, and holds that the former is essentially the work of the Church, it contests the right of the state to compel parents to send their children to the state schools and only to the state schools. In logical sequence to these tenets it seeks to divorce the school from the state—a proceeding which it terms educational freedom, though the underlying motive is to subordinate the school to the Church. In the domain of religion, Ultramontanism tends to foster popular superstitions and to emphasize outward forms as the essence of religious life, for it can only maintain its dominion so long as the common people remain at a low spiritual level. If any one desires to appreciate the intellectual plane—

and the power—of this Ultramontane habit of thought, he will find ample material in the performances of the notorious swindler Leo Taxil under Leo XIII., and in the acceptance of his blasphemous effusions by the highest ranks of the clergy.

In the fourth place, Ultramontanism is the embodiment of intolerance towards other creeds. The general presupposition involved is that a man cannot be saved except within the Catholic Church. Since, however, on the one hand—in virtue of a theory advanced by Pius IX. against the emperor William I. of Germany, in a letter which has since become famous—every Christian, whether he will or no, belongs to that Church by baptism, and is consequently pledged to obey her, and, on the other hand, since the state lies under the obligation to place the "secular arm" at her disposal whenever one of her members wishes to secede, the most far-reaching consequences result. In the past this principle led to the erection of the Inquisition (*q.v.*) and, even at the present day, there exists in the Curia a special congregation charged with its application (see CURIA ROMANA). On the Roman Catholic side the employment of compulsion against heretics has never been acknowledged as a blunder; and this method of silencing opposition has found champions in the bosom of the Church down to the most recent years. But the development of modern culture has rendered these exploits of an unbridled fanaticism impossible, and no government would consent to enforce the once obligatory sentences of ecclesiastical courts. As a result of this situation, the Catholic condemnation of heresy—though as stringent as ever in principle—has assumed less dangerous forms for the heretic. Nevertheless, it proved capable, even in the 19th century, of imposing onerous restrictions on the heterodox, and practical exemplifications of this hostile attitude persist to the present day. The embittering influence of Ultramontanism may be further traced in its attitude towards the baptism of non-Catholics, for it seeks to establish the rule that baptism conferred by Protestants is invalid through defect of form or matter, or even of intention, and that, consequently, the rite must be readministered, at least conditionally, to proselytes joining the Roman Church. Finally, ample scope for the display of tolerance—or intolerance—is found in the mixed marriages between Protestants and Catholics, which, as a result of the modern facilities for intercommunication and the consequent greater mobility of the population, have shown a large increase during the last few decades—in Germany, for instance. Here, again, Ultramontanism has done much to aggravate the pernicious feud between the two creeds, by exacting a promise before marriage from the Roman Catholic party that all the children shall be brought up as members of the Roman Catholic Church (see MARRIAGE: *Canon Law*). A like result has been produced when, in response to Ultramontane agitation, interdicts have been placed on churchyards in which non-Catholics have found their last resting-place.

Lastly, Ultramontanism is the foe of the nationalization of Catholicism. This peculiarity is connected, though not identical, with the above-mentioned tendency towards the Romanization of the Church. Just as in Protestant countries there has often been an amalgamation of evangelical belief with national feeling, to the great gain of both, Catholics demand that Catholicism shall enter into the sphere of their national interests, and that the activities of the Catholic Church should rest on a national basis. These aspirations have been proclaimed with especial emphasis in France, in Germany (*Reformkatholizismus*) and in the United States (*Americanism*; see HECKER, I. T.) but are everywhere met with a blank refusal from the Ultramontane side. For Ultramontanism fears that any infusion of a national element into ecclesiastical life would entail the eventual independence of the people in question from papal control, and lead to developments opposed to its papalistic mode of thought. It endeavours, therefore, to undermine all aspirations of this nature and, its own tendency being essentially international, strives to ensure that national sentiment and national interests shall not find over-zealous champions among the clergy.

The relationship of Ultramontanism to Catholicism is a much-disputed problem. The Ultramontane, indeed, maintains that there is no justification for distinguishing between the two: but the motives underlying this attitude are obvious. For, by representing the prosecution of its party-political objects as a championship of the Catholic Church, Ultramontanism seeks to acquire the support of the official organs of that Church, and the good will of all circles interested in her welfare; while at the same time it strives to discredit any attempt at opposition by branding it as an assault on the orthodox faith. But, even within the pale of the Roman Church, this identification provokes emphatic dissent, and is repudiated by all who are shocked by the effects of a one-sided accentuation of political Catholicism on the inner life of the church, and are reluctant to see the priest playing the part of a political agitator. It was on these grounds that Count May, in January 1904, proposed in the chamber of the Bavarian Reichsrath that the clergy should be deprived of the suffrage. In Germany, again, the last few years have witnessed a growing aversion from Ultramontanism on the part of those Catholics who cannot reconcile its tenets with their patriotic sentiments, and are disinclined to submit to a limitation of their share in the intellectual life of the times, particularly in art, science and literature. It may be admitted that, in many cases, the distinction between Ultramontanism and Catholicism cannot be clearly traced; and it is impossible to draw a sharp line of severance between the two, which could be absolutely valid under all circumstances and in relation to all questions. For there are many almost imperceptible stages of transition from the one to the other; and, for all the principal contentions of Ultramontanism, analogies may be found in the past history of the Catholic Church. Thus, in the middle ages, we find extremely bold pronouncements with respect to the position of the papacy in the universal Church; while political Catholicism had its beginnings in antiquity and found very definite expression, for instance, in the bull *Unam sanctam* of Boniface VIII. Again, the attempt to subordinate all intellectual life to ecclesiastical control was a feature of the medieval Church, and the fundamental attitude of that Church towards heresy was fixed during the same period. But since then much has been altered both in the Church and her secular environment. The state has become independent of the Church, legislates on its own sole authority, and has recognized as falling within its own proper sphere the civilizing agencies and social questions formerly reserved for the Church. Again, education, science, art and literature have been secularized: the printing-press carries knowledge into every house, the number of illiterates diminishes from year to year in every civilized country, and the clergy are no longer the exclusive propagators of culture, but merely one factor among a hundred others. Finally, the Roman Catholic Church has long forfeited the privileged position formerly accorded as her due. The days when she was *the* Christian Church are past: and now the civic rights of a man in a modern state are not curtailed, though he may neglect his duty to the Church or flatly refuse to acknowledge the existence of any such duty. The struggle for religious freedom has suffered no intermission since the beginning of the Reformation; and the result is that to-day its recognition is considered one of the most precious trophies won in the evolution of modern civilization; nor can these changes be reversed, for they stand in the closest connexion and reciprocity one with another, and represent the fruits of centuries of co-operation on the part of the European peoples. But Ultramontanism ignores this latest page of history and treats it as non-existent, aspiring to the erection of a new order of society, similar to that which Rome created—or, at least, endeavoured to create—in the halcyon days of medievalism. For the justification of this enterprise, it is considered sufficient to point out that the several elements of its programme once enjoyed validity within the Church. But Cyprian of Carthage said long ago, *Consuetudo sine veritate vetustas erroris est*; and the bare fact of previous existence is no argument for the re-introduction of obsolete and antiquated institutions and theories. But, under the guise of a restoration on conservative lines, Ultramontanism—notwithstanding the totally different conditions which now obtain—girds itself to work for an ideal of religion and culture in vogue during the middle ages, and at the same time holds itself justified in adopting the extreme point of view with respect to all questions which we have mentioned. Thus Ultramontanism is not to be conceived as a theological movement, but as the programme of a party whose principles are in fundamental opposition to modern culture, modern education, modern tolerance and the modern state—a party which seeks to carry out its campaign against the society of to-day, not by bridging the gulf betwixt creed and creed, but by widening it, by awakening religious fanaticism, and by closing the way to a peaceful co-operation of Catholics and non-Catholics in the highest tasks of culture and human civilization. The hierophants of this Ultramontane system are to be found in the Society of Jesus (See JESUITS). In fact, the terms *jesuitical* and *ultramontane* may, in numerous cases, be regarded as equivalent.

The origin of modern Ultramontanism is preceded and conditioned by the collapse of Catholicism in the period of the French Revolution. Pius VI. and Pius VII. were expelled from Rome, deprived of the papal states, and banished to France. In that country the Church almost completely lost her possessions; in Germany they were at least considerably curtailed; in both the hierarchical organization was shattered, while the Catholic laity surveyed the catastrophe in complete passivity. But from this severe fall the Roman Church recovered with comparative readiness, and the upward movement is contemporaneous with the rise of Ultramontanism. The birth of that system, however, cannot be fixed as a definite event by the day and the hour; nor was it created by any single personality. Rather it was the product of the first post-revolutionary generation. Neither is it merely fortuitous that the reaction proceeded from France itself. For in no other country had hostility to religion attained such a pitch or assumed such grotesque forms; and consequently in no other country did the yearning for religion manifest itself so unequivocally, when bitter experience had demonstrated the necessity of a return to law and order. And in the other states of Europe there existed, more or less, a similar desire for peace and an equal dread of a fresh outbreak of revolutionary violence. In contrast to the struggle for an ideal freedom, which was at first hailed with tempestuous delight only to reveal itself as a dangerous tyranny, men became conscious of the need for a firmly established authority in the reconstruction of society. After the violent upheaval in the political world during the last few decades, the existent—as such—increased in value, and the high estimation in which the old régime was now held led to a policy of restoration. At the same time, the repression of idealism and sentiment during the period of "illumination" was amply revenged, and the barren age of reason gave place to Romanticism. These tendencies in contemporary opinion favoured the renovation of the Roman Catholic Church. But the papacy signalized its reinstation by restoring the Society of Jesus (1814) and re-establishing the index. Even before this, the earliest germs can be traced back into the revolutionary period itself—the movement characterized above had begun working in France on the same lines; and, as it showed great zeal for the increase of the papal authority, it received the support of the Curia. True, the principles of Bonald, Lemaître, Lamennais and Lacordaire, were not carried through in the French Church without opposition; but, about the year 1850, they had become predominant there. In Germany Ultramontanism had to contend with great difficulties; for here ecclesiastical affairs were not in so desperate a case that the most drastic remedies possessed the most powerful attraction; while, in addition, the clergy were too highly educated to be willing to renounce all scientific work. The result was that a series of violent struggles took place between the old Catholicism and the new Ultramontane species (Hermes, Baader, Döllinger, &c.). But even here Ultramontanism gained ground and derived inestimable assistance from the blunders of government after government—witness the conflict of the Prussian administration with Archbishop Droste-Vischering (*q.v.*) of Cologne, 1837. Additional impetus was also lent by the revolution of 1848.

The growth of the Jesuitical influence at Rome—more especially after the return of Pius IX. from exile—implied a more definite protection of Ultramontanism by the papacy. The proclamation of the dogma of the immaculate conception in 1854 was more than the decision of an old and vexed theological problem; it was an act of conformity to a pietistic type especially represented by the Jesuits. The Syllabus of 1864, however, carried with it a recognition of the Ultramontane condemnation of all modern culture (see the articles PIUS IX., and SYLLABUS). Finally, in the Vatican Council, the Jesuits saw another of their favourite theories—that of papal infallibility—elevated to the status of a dogma of the Church (see VATICAN COUNCIL and INFALLIBILITY).

Ultramontanism, again, though essentially averse from all forms of progress, had displayed great dexterity in utilizing the opportunities presented to it by modern life. Where it appeared advisable, it has formed itself into a political party, as for instance, the Centre Party in Germany. It has shown extreme activity in the creation of a press devoted to its interests, and has consolidated its influence by the formation of an extensive league-system. In the episcopacy it has numerous adherents; it has made progress in the universities, and most of the learned and theological reviews are conducted in its spirit.

Whether the powerful position of this movement within the Roman Catholic Church be an advantage for that Church itself cannot be discussed here. The answer to the problem will mainly depend on the estimate which we form of the Society of Jesus and its whole activity. The outstanding event in the latest history of Ultramontanism is the separation between Church and state in France (1904), by which the republic has endeavoured to break the influence of this party. Similarly, the dissolution of the German Reichstag in December 1906 was a weapon directed against Ultramontanism; and, though the elections of 1907 failed to diminish the numbers of the Centre, they rendered possible the formation of a majority, in face of which that system forfeited the influence it had previously possessed.

ULUGH BEG, MIRZA MAHOMMED BEN SHAH ROK (1394–1449), Persian astronomer, son of the shah Rok and grandson of Timur, succeeded his father as prince of Samarkand in 1447, after having for years taken part in the government, and was murdered in 1449 by his eldest son. He erected an observatory at Samarkand, from which were issued tables of the sun, moon and planets, with an interesting introduction, which throws much light on the trigonometry and astronomical methods then in use (*Prolégomènes des tables astronomiques d'Oouloug Beg*, ed. by Sédillot, Paris, 1847, and translated by the same, 1853). The serious errors which he found in the Arabian star catalogues (which were simply copied from Ptolemy, adding the effect of precession to the longitudes) induced him to redetermine the positions of 992 fixed stars, to which he added 27 stars from Al Sûfi's catalogue, which were too far south to be observed at Samarkand.

This catalogue, the first original one since Ptolemy, was edited by Th. Hyde at Oxford in 1665 (*Tabulae longitudinis et latitudinis stellarum fixarum ex observatione Ulugbeighi*), by G. Sharpe in 1767, and in 1843 by F. Baily in vol. xiii. of the *Memoirs* of the Royal Astronomical Society.

See Delambre, *Histoire de l'astronomie du moyen âge*; Poggendorff, *Biographisch-litterarisches*.

ULUNDI (Zulu for "high place"), the royal kraal of Cetywayo, situated in the Mahlabatini district of Zululand, about 3 m. north of the White Umfolosi River, and 115 m. N.N.E. of Durban. The valley of the White Umfolosi here forms an extensive basin called the Emhlabatini, and from the time of Chaka to the overthrow of Cetywayo in 1883 was the exclusive place of residence of the Zulu kings. The basin on the south side of the river is regarded as the cradle of the Zulu race; here all their early chiefs are buried, hence the term Emakosini (*i.e.* at the grave of the chiefs) applied to the district (see Blue Book C. 5143). During Cetywayo's reign a garrison of 3000 was kept at Ulundi. About a mile from the kraal on the 4th of July 1879 a Zulu army some 20,000 strong was totally defeated by Lord Chelmsford. The British force, consisting of the second division and Wood's column, numbered in all 4200 Europeans and some 1000 natives. On the morning of the battle they formed a square, with the mounted troops (about 300) inside. The Zulus attacked with great gallantry but were received with so deadly a fire that they could not come within thirty yards of the rifles. After twenty minutes they broke and fled, and the cavalry followed them till broken ground rendered further pursuit impossible. The British loss was about 100, that of the Zulus 1500. After the fight the royal kraal was burned. On the 1st of September following, at the site of the ruined kraal, Sir Garnet (afterwards Lord) Wolseley announced the partition of Zululand into thirteen petty chieftainships. But on the 29th of January 1883 Cetywayo was reinstalled by the British at Ulundi as chief over two-thirds of his old dominions. Attacked at Ulundi in July 1883 by the rival chief Usibepu, Cetywayo and his 5000 followers fled to the Nkandhla bush. The royal kraal was again destroyed and Ulundi ceased to be a rallying point. The magistracy for the district is situated 5 m. north of the site of Ulundi. (See ZULULAND.)

ULVERSTON, a market town in the North Lonsdale parliamentary division of Lancashire, England, in the Furness district, 9½ m. N.E. from Barrow-in-Furness and 256 m. N.W. by N. from London, on the Furness railway. Pop. of urban district (1901), 10,064. The church of St Mary, founded in 1111, retains the south door of the original building in the Transition style, but the greater portion of the structure is Perpendicular, of the time of Henry VIII. It contains an altar-tomb with recumbent figure of Walter Sandys of Conishead, dated 1588. After the destruction of Furness Abbey, Ulverston succeeded Dalton as the most important town in Furness, but the rapid rise of Barrow surpassed it in modern times. A monument on Hoad Hill commemorates Sir John Barrow, secretary of the admiralty and a native of the town. Conishead Priory, 2 m. south-east, a mansion on the site of a priory founded in the reign of Henry II., is used as a hydropathic establishment. Formerly Ulverston had a considerable trade in linens, checks and ginghams, but it is now dependent on large iron and steel works, chemical works, breweries, tan-yards, and hardware, paper, and wooden hoop manufactories. Through its connexion with Morecambe Bay by a ship canal of 1 m. in length, owned by the Furness railway, it has a shipping trade in iron and slates.

Ulverston, otherwise Vlureston, Olvestonum, occurs in Domesday Book, where Vlurestun is named as a manor in possession of Turulf, who was probably the original Saxon owner. Early in the 12th century the manor passed to Stephen, count of Boulogne, and was given by him to Furness Abbey. In 1196 the abbot granted the vill of Ulverstone with the inhabitants to Gilbert Fitz-Reinfred, who granted it a charter by which he raised it to the rank of a free borough. The lordship became divided, and one-half passed to the Harringtons and finally to Henry Grey, duke of Suffolk, on whose attainder in 1553 it was forfeited to the Crown. The other moiety returned to the abbey about the end of the 14th century, and at the dissolution was surrendered to the Crown. Early in the 17th century the Crown alienated the manor, which is now in the family of Buccleuch. The yearly court-leet and court-baron are still held in October. In 1280 Roger de Lancaster obtained a charter from Edward I. for a weekly market on Thursday and an annual fair of three days beginning on the eve of the nativity (Sept. 7).

UMAÑ, a town of Russia, in the government of Kiev, 120 m. S. of the city of Kiev. Pop. 28,628, many of whom are Jews, and carry on the export of corn, spirits, &c. It has a park (290 acres), planted in 1793 by Count Potocki, and now containing a gardening school. Umañ was founded early in the 17th century as a fort against the Tatar raiders. The Cossacks of the Ukraine, who kept it, revolted against their Polish rulers about 1665, and sustained a fierce siege. In 1674 it was plundered and most of its inhabitants murdered by the Ukrainians and Turks. In 1712 its last occupants were transferred by Peter the Great to the left bank of the Dnieper. But by the end of the 18th century, when it again became the property of the Potockis, it was repeopled and became one of the busiest trading towns of Little Russia. In 1768, when the Cossacks revolted anew against the Poles, they took Umañ and murdered most of its inhabitants.

UMARKOT, a town in Sind, India, 7 m. from a station on the North-Western railway; pop. (1901), 4924. It is the headquarters of the Thar and Parkar district. The Mogul emperor Akbar was born here in 1542, when his father, Humayun, was fleeing to Afghanistan.

UMBALLA, or AMBALA, a city and district of British India, in the Delhi division of the Punjab. The city is 3 m. E. of the river Ghaggar, 902 ft. above the sea. Pop. (1901), 78,638. It has a station on the North-Western railway (1077 m. N.W. of Calcutta), with a branch line to Kalka at the foot of the hills (39 m.), which was continued up to Simla in 1903. Umballa owes its importance to a large military cantonment which was first established in 1843, and is the headquarters of a cavalry brigade belonging to the Northern army. The cantonment, which lies 4 m. south-east of the native town, is well laid out with broad roads shaded by trees. It contains a church, a club-house, several hotels and English shops.

The DISTRICT OF UMBALLA has an area of 1851 sq. m. With one small exception it consists of a level alluvial plain, sloping away gradually from the foot of the Himalayas, and lying between the rivers Jumna and Sutlej. These rivers do not materially affect the district, which has a drainage system consisting of the numerous torrents which pour down from the hills. In the south these torrents run in broad sandy beds scarcely below the surface of the country, and vary from 200 yds. to 1 m. in width, until, at a distance of 20 or 30 m. from the hills, they become comparatively docile streams, with well-defined clay banks. Towards the north the torrents run in deep beds from the point where they debouch from the hills; they also differ from the streams of the south in being free from sand. The principal of these northern streams is the Ghaggar, into which the minor streams empty themselves, some within and some beyond the limits of the district. Whatever surplus water of this river is not swallowed up by irrigation passes on through Patiala state and Sirsa, and is finally lost in the sands of Rajputana. The Ghaggar is the only perennial stream within the district, but dwindles to a tiny rivulet in the dry season, and disappears altogether beyond the border of the district. In 1901 the population was 815,880, showing a decrease of 5·6% in the decade. The principal crops are wheat, maize, pulse, millets, rice, cotton and some sugar-cane. There are factories for ginning and pressing cotton, and also for grinding wheat. Two opposite corners of the district are watered by the Sirhind and the Eastern Jumna canals. A portion is crossed by the main line of the North-Western railway and by the Delhi-Umballa-Kalka railway, which have their junction at Umballa city. Umballa is one of the territories previously held by numerous Sikh sirdars, which were attacked by Ranjit Singh during one of his marauding expeditions. This caused the movement of British troops in 1809 which resulted in the treaty with Ranjit Singh, by which he was required to withdraw his army from the left bank of the Sutlej and to relinquish his recent conquests in Sirhind. In June 1849, after the second Sikh War had brought the Punjab under British rule, the chiefs were deprived of all sovereign power and the district took practically its modern form. In March 1869 a grand durbar was held at Umballa on the occasion of the visit of the amir Shere Ali.

UMBELLIFERAE, in botany, an order of polypetalous Dicotyledons belonging to the series Umbelliflorae, which includes also the orders Araliaceae (ivy family) and Cornaceae (dogwood family). It contains 180 genera with about 1400 species, occurring in all parts of the world but chiefly in north temperate regions. It is well represented in the British flora by 35 genera. The plants are annual or perennial herbs, rarely shrubby as sometimes in *Bupleurum,* with generally a very characteristic habit, namely stout erect stems with hollow internodes, alternate pinnately compound exstipulate sheathing leaves and compound umbels of small, generally white, flowers.

An example of an annual is the common fool's parsley, *Aethusa Cynapium*; carrot (*Daucus Carota*) is a biennial; others are perennial, persisting by means of tubers or rhizomes—such are hogweed (*Heracleum*), *Angelica*, *Peucedanum*, and others. Some genera have a creeping stem as in *Hydrocotyle* (pennywort), a small herb with a creeping filiform stem and, in the British species, entire leaves. *Bupleurum* has simple, entire, often perfoliate leaves (fig. 1). *Azorella*, a large genus in south temperate regions, has a peculiar caespitose habit, forming dense cushions often several feet in diameter and persisting for many years. *Eryngium*, represented in Britain by sea-holly (*E. maritimum*), is a large genus of rigid often glaucous herbs with spiny-toothed leaves, which in some South American species with narrow parallel-veined blade and broadly sheathing base recall those of a Monocotyledon such as *Agave* or *Bromelia*. In sanicle (*Sanicula*), *Astrantia* and others the leaves are palmately divided; and there is a great variety in the degree of division in the characteristic pinnate leaf, which varies from simply pinnate to a branching of the blade to the fifth or sixth order.

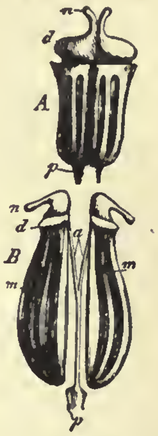
FIG. 1.—Perfoliate leaf of a species of hare's-ear (*Bupleurum rotundifolium*). The two lobes at the base of the leaf are united, so that the stalk appears to come through the leaf.

There is also considerable variety in the development of the umbel, which is usually compound but sometimes simple, as generally in *Hydrocotyle* and *Astrantia*, rarely reduced to a single flower as in species of *Hydrocotyle*. In *Eryngium* the flowers are crowded into dense heads subtended by a whorl of rigid bracts. A terminal flower is sometimes present as in carrot, where it is distinguished by its form and dark colour. The presence or absence of bracts and their form when present afford useful diagnostic characters. When present at the base of the primary rays of the umbel they form the *involucre*, and the *involucel* when at the base of a partial umbel. In *Astrantia* the simple umbel is enveloped by a large, often coloured, involucre.

The small epigynous flowers are usually hermaphrodite and regular, with parts in fives. The sepals are usually very small, often represented only by teeth on the upper edge of the ovary; the petals are usually obovate or obcordate in shape, often with the tip inflexed; the stamens have long slender filaments bent inwards in the bud but ultimately spreading; the two carpels are in the median plane; the two-celled ovary is surmounted by an epigynous glandular disk—the stylopodium—which bears the two styles. Each ovary-cell contains a single pendulous anatropous ovule with a ventral raphe and a single integument. In the development of the flower the stamens appear first, followed by the petals, the sepals and the rudiments of the carpels in succession. The flowers are rendered conspicuous by being massed into more or less dense flat-topped inflorescences. A resemblance to the rayed heads of Compositae is suggested in the frequently larger size of the flowers on the circumference of the umbel which are often sterile and zygomorphic from the larger size of the outer petals. This arrangement allows a large number of flowers to be visited in a short time. The flowers are generally white, sometimes pink or yellow, very rarely blue; they are generally scented, but the whole plant has an odour from the general presence in the tissues of an ethereal oil or resin. The flower is widely open, the petals and stamens radiating from the central disk (fig. 3, *d*), on which honey is secreted, and is thus accessible to quite short-lipped flies. Cross-pollination is rendered necessary by the flowers being generally markedly proterandrous; the stamens throughout the umbel have generally shed their pollen before the stigmas have begun to be functional even in the outer flowers.

FIG. 2.—Diagram of flower of Umbelliferae.

The fruit is again very characteristic; a schizocarp which splits down the septum to form two dry one-seeded mericarps which are at first attached to, or pendulous from, an entire or split central axis or *carpophore* (fig. 3). The form of the mericarp affords valuable characters for distinguishing genera. On the outer surface of each are generally 5 ridges (primary ridges), between which are sometimes 4 secondary ridges; oil-cavities, *vittae*, are often present in the intervening furrows. The fruits are variously adapted for distribution; they are sometimes thin and flat as in *Heracleum*, when they are easily carried by the wind, or, as in carrot, provided with hooks. The seed contains a small embryo embedded in oily endosperm, which is usually cartilaginous in texture.



(From Vines's *Student's Text Book of Botany*, by permission of Swan, Sonnenschein & Co.)

FIG. 3.—*A*, Pistil; *B*, Fruit of the Caraway (*Carum Carui*); enlarged.
d, epigynous disk; *f*, ovary; *n*, stigma; *p*, pedicel. In *B* the two carpels have separated so as to form two mericarps (*m*). Part of the septum constitutes the carpophore (*a*).

The order is divided into 9 tribes depending on the form of the fruit, whether compressed, angled, grooved, constricted, &c., and the presence or absence of *vittae*. The 35 British genera include representatives of 7 of the tribes. The following may be mentioned: *Hydrocotyle* (pennywort), *Eryngium* (sea-holly), *Sanicula* (sanicle), *Conium* (hemlock, *q.v.*), *Smyrnium* (Alexanders), *Bupleurum* (hare's-ear), *Apium* (celery, *q.v.*), *Carum* (caraway, *q.v.*), *Conopodium* or *Bunium* (earth-nut, *q.v.*), *Myrrhis* (Cicely), *Chaerophyllum* (chervil), *Foeniculum* (fennel, *q.v.*), *Crithmum* (samphire), *Oenanthe* (water dropwort), *Aethusa* (fool's parsley, *q.v.*), *Angelica* (*q.v.*), *Peucedanum* (hog's fennel, parsnip, *q.v.*), *Heracleum* (hogweed), *Daucus* (carrot). *Petroselinum sativum* is common parsley (*q.v.*).

FIG. 4.—Water Dropwort, *Oenanthe crocata*, with thickened root fibres, about half nat. size.
1, Flower; 2 and 3, Side and front view of fruit; enlarged.

UMBER, a brown mineral pigment consisting of hydrated iron and manganese oxides. The finely-powdered mineral is known as *raw umber*; when calcined the beauty of the colour increases and the pigment is known as *burnt umber*. It was probably first obtained from Umbria in Italy, but it occurs in many localities, notably in Cyprus (*Turkey umber*); large quantities of *English umber* are mined in Devonshire and Cornwall. (See PIGMENTS.)

UMBRA (Lat. for shade or shadow), in astronomy, the completely dark portion of the shadow of a heavenly body, filling the space within which the sun is entirely hidden. The body being supposed spherical, the umbra is a cone circumscribing both the sun and the body that casts the shadow. The term is also given to the interior and darkest part of a sunspot. (See SUN; ECLIPSE.)

UMBRELLA, a portable folding protector from rain (Fr. *parapluie*), the name parasol being given to the smaller and more fanciful article carried by ladies as a sunshade, and the *en-tout-cas* being available for both purposes. Primarily the umbrella (*ombrella*, Ital. dim. from Lat. *umbra*, shade) was a sunshade alone—its original home having been in hot, brilliant climates. In Eastern countries from the earliest times the umbrella was one of the insignia of royalty and power. On the sculptured remains of ancient Nineveh and Egypt there are representations of kings and sometimes of lesser potentates going in procession with an umbrella carried over their heads; and throughout Asia the umbrella had, and still has, something of the same significance. The Mahratta princes of India had among their titles "lord of the umbrella." In 1855 the king of Burma in addressing the governor-general of India termed himself "the monarch who reigns over the great umbrella-wearing chiefs of the Eastern countries." The baldachins erected over ecclesiastical chairs, altars and portals, and the canopies of thrones and pulpits, &c., are in their origin closely related to umbrellas, and have the same symbolic significance. In each of the basilican churches of Rome there still hangs a large umbrella.

Among the Greeks and Romans the umbrella (σκιάς, σκιάδειον, *umbraculum*, *umbella*) was used by ladies, while the carrying of it by men was regarded as a sign of effeminacy. Probably in these southern climes it never went out of use, and allusions by Montaigne show that in his day its employment as a sunshade was quite common in Italy. The umbrella was not unknown in England in the 17th century, and was already used as a rain protector. Michael Drayton, writing about the beginning of the 17th century, says, speaking of doves:—

> "And, like umbrellas, with their feathers
> Shield you in all sorts of weathers."

Although it was the practice to keep an umbrella in the coffee-houses early in the 18th century, its use cannot have been very familiar, for in 1752 Colonel Wolfe, writing from Paris, mentions the carrying of them there as a defence against both rain and sun, and wonders that they are not introduced into England. The traveller Jonas Hanway, who died in 1786, is credited with having been the first Englishman who habitually carried an umbrella.

The umbrella, as at first used, was based on its Eastern prototype, and was a heavy, ungainly article which did not hold well together. It had a long handle, with ribs of whalebone or cane, very rarely of metal, and stretchers of cane. The jointing of the ribs and stretchers to the stick and to each other was very rough and imperfect. The covering material consisted of oiled silk or cotton, heavy in substance, and liable to stick together in the folds. Gingham soon came to be substituted for the oiled cloth, and in 1848 William Sangster patented the use of alpaca as an umbrella covering material. One of the most notable inventions for combining lightness, strength and elasticity in the ribs of umbrellas was the "Paragon" rib patented by Samuel Fox in 1852. It is formed of a thin strip of steel rolled into a U or trough section, a form which gives great strength for the weight of metal. Umbrella silk is chiefly made at Lyons and Crefeld; much of it is so loaded that it cuts readily at the folds. Textures of pure silk or of silk and alpaca mixed have better wear-resisting properties.

UMBRIA (Ὀμβρική), the name of an ancient and a modern district of Italy.

1. The ancient district was bounded in the period of the Roman supremacy by the Ager Gallicus (in a line with Ravenna) on the N., by Etruria (the Tiber) on the W., by the Sabine territory on the S. and by Picenum on the E. The Via Flaminia passed up through it from Ocriculum to Ariminum; along it lay the important towns of Narnia (Narni) Carsulae, Mevania (Bevagna), Forum Flaminii, Nuceria Camellaria (Nocera) and Forum Sempronii; and on the Adriatic coast Fanum Fortunae (Fano) and Pisaurum (Pesaro). To the east lay Interamna (Terni), Spoletium (Spoleto), Fulginium (Foligno—on a branch of the Via Flaminia which left the main road at Varina and rejoined it at Forum Flaminii) and the important town of Camerinum on the side of the Apennines towards Picenum. On the side towards Etruria lay Ameria (Amelia) and Tuder (Todi), both on the direct road from Rome to Perusia,[1] Iguvium, which occupied a very advantageous position close to the main pass through the Apennines, and Hispellum (Spello). Not far off was Assisium (Assisi), whilst far to the north in the mountains lay Sarsina. Under the empire it formed the sixth region of Italy. In earlier times it embraced a far larger area. Herodotus (iv. 49) describes it as extending to the Alps, and the περίοδος ascribed to Scylax (a treatise which embodies material of the 4th century B.C. or earlier) makes Umbria conterminous with Samnium. Furthermore, place-names of undoubted Umbrian origin abound in Etruria and are also found in the Po valley. Thus in the early days of Italian history Umbria may be taken as having extended over the greater part of northern and central Italy.

The name Umbria is derived from the Umbri, one of the chief constituent stocks of the Italian nation. The origin and ethnic affinities of the Umbrians are still in some degree a matter of dispute, but their language proves them to have been an Aryan people closely allied with the Oscans and in a remoter degree with the Latins. Archaeological considerations further show with approximate certainty that the Umbri are to be identified with the creators of the Terramara (*q.v.*), and probably also of the Villanova (*q.v.*), culture in northern and central Italy, who at the beginning of the Bronze Age displaced the original Ligurian population by an invasion from the north-east. From the time and starting-point of their migrations, as well as from their type of culture, it may be provisionally inferred that the Umbrians were cognate with the Achaeans of prehistoric Greece. Pliny's statement (iii. 13, 19) that they were the most ancient race of Italy may certainly be rejected.

The process by which the Umbrians were deprived of their predominance in upper and central Italy and restricted to their confines of historic times cannot be traced in any detail. A tradition declares that their easternmost territory in the region of Ancona was wrested from them by the Picentes, a branch of the Sabine stock. It may also be conjectured that they were partly displaced in the valley of the Po by the Gaulish tribes which began to pour across the Alps from about 500 B.C. But their chief enemies were undoubtedly the Etruscans. These invaders, whose encroachments can be determined by archaeological evidence as proceeding from the western seaboard towards the north and east, and as lasting from about 700 to 500 B.C., eventually drove the Umbrians into that upland tract athwart the Apennines to which the name of Umbria belonged in historical times. In the course of this struggle the Etruscans are said to have captured 300 Umbrian towns. Nevertheless the Umbrian element of population does not seem to have been eradicated in the conquered districts. Strabo records a tradition that the Umbrians recovered their ground in the plain of the Po at the expense of the Etruscans, and states that the colonies subsequently founded in this region by the Romans contained large Umbrian contingents. In Etruria proper the persistence of the Umbrian stock is indicated by the survival of numerous Umbrian place-names, and by the record of Umbrian soldiers taking part in Etruscan enterprises, *e.g.* the

[1] The geographers make this road go round by Vettona (mod. Bettona) between Tuder and Perusia, instead of following the more direct modern line.

attack on Cumae in 524 B.C. Indeed it is not unlikely that the bulk of the population in Etruria continued to be of Umbrian origin, and that the Romanization of this country was facilitated by the partial absorption of the Etruscan conquerors into the Umbrian multitude.

Against the Romans the Umbrians never fought any wars of importance, a fact which may be explained partly by the remoteness of their position, but chiefly by the common hostility of the two nations to the Etruscans. After the downfall of the Etruscan power they made a belated attempt to aid their Samnite kinsmen in their decisive struggle against Rome (308 B.C.); but their communications with Samnium were impeded by the foundation of a Roman fortress at Narnia (298 B.C.), and at the great battle of Sentinum (295 B.C.), which was fought in their own territory, the Umbrians are not reported to have lent the Samnites any substantial help. It is perhaps on account of this defection that in 200 B.C. they received from the Romans a portion of the Ager Gallicus reconquered from the Senonian Gauls. They offered no opposition to the construction of the Via Flaminia through the heart of their country, and in the Second Punic War withheld all assistance from Hannibal. In the Social War (90–89 B.C.), they joined the rebels tardily and were among the first to make their peace with Rome. Henceforth the Umbrians no longer played an independent part in Italian history.

The material prosperity of Umbria, in spite of its unfavourable position for commercial intercourse, was relatively great, owing to the fertility of the numerous small valleys which intersect the Apennine system in this region. The chief products of the soil were olives, vines and spelt; the uplands harboured the choicest boars of Italy. In Pliny's time there still existed in Umbria 49 independent communities, and the abundance of inscriptions and the high proportion of recruits furnished to the imperial army attest its continued populousness. Among its most famous natives were the poets Plautus (b. at Sarsina) and Propertius (b. at Assisi).

Of the Umbrians' political and municipal organization little is known. In addition to the city (*tota*) they seem to have had a larger territorial division in the *tribus* (*trifu*, acc.) as we gather from Livy (xxxi. 2, "per Umbriam quam tribum Sapiniam vocant"; cf. xxxiii. 37) and from the Eugubine Tables ("trifor Tarsinates," vi. B. 54). Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits (Theopompus, *Fragm.* 142; Pseudo-Scymnus, 366–368). It is almost certain that each race influenced and modified the other to a large extent. There is conclusive proof of strong Etruscan influences in Umbria. For instance, they undoubtedly borrowed their alphabet and the art of writing from the Etruscans. Their writing ran from right to left. The alphabet consisted of nineteen letters. It had no separate symbols for O, G, Q; the aspirates and X were wanting; on the other hand, it possessed forms for Z and V, and had likewise the Etruscan *f* (8). It also had a symbol peculiar to itself for expressing the sound of palatal *k* when followed by either *e* or *i*. The fact that it is only in towns on the side next Etruria, *e.g.* Tuder and Iguvium, that a coinage is found indicates that they borrowed the art of minting from that quarter. The Umbrians counted their day from noon to noon. But whether they borrowed this likewise from the Etruscans we do not know (Pliny ii. 77). In their measuring of land they employed the *vorsus*, a measure common to them and the Oscans (Frontinus, *De Limit.* p. 30), 3⅓ of which went to the Roman *jugerum*.

See Strabo bk. v.; T. E. Peet, *The Stone and Bronze Ages of Italy and Sicily* (Oxford, 1909), pp. 492–510; B. V. Head, *Historia numorum* (Oxford, 1887); B. Nissen, *Italische Landeskunde*; Bücheler, *Umbrica* (1883); R. S. Conway, *Italic Dialects*. (M. O. B. C.)

2. The modern territorial division is situated in the middle of the peninsula, between Tuscany and the Marches on the N. and E., and Rome and the Abruzzi on the S. and W., and comprising the one province of Perugia, with an area of 3748 sq. m.; pop. (1901), 675,352. Umbria and the two provinces of Ancona and Pesaro and Urbino taken together form an área slightly more extensive than that of the sixth region of Augustus. The surface is mountainous, but affords good pasture, and there are numerous fertile valleys. Many treasures of art and architecture are preserved, and Umbria is in this respect one of the most interesting regions of Italy (see PERUGIA). Modern Umbria formed down to 1860 a part of the States of the Church.

Two main lines of railway run through the territory. That from Florence to Rome skirts the borders of the province on the west, running north and south, while the Rome-Ancona runs across the province from north-east to south-west. The cross communication is given by three branch lines. In the north a narrow gauge line from Arezzo to Fossato passes through Gubbio. Perugia, the capital of the province, stands on the line from Terontola to Foligno, while on the extreme south a line passing through Rieti and Aquila, and ultimately reaching Sulmona, starts from Terni on the Rome-Ancona line. (T. As.)

UMFRAVILLE, the name of an English baronial family, derived from Amfreville in Normandy. Members of this family obtained lands in Northumberland, including Redesdale and Prudhoe, from the Norman kings, and a later member, Gilbert de Umfraville (d. 1245), married Matilda, daughter of Malcolm, earl of Angus, and obtained this Scottish earldom. Gilbert's son, Gilbert, earl of Angus (*c.* 1244–1307), took part in the fighting between Henry III. and his barons, and in the Scottish expeditions of Edward I. His son, Robert, earl of Angus (1277–1325), was taken prisoner by the Scots at Bannockburn, but was soon released, though he was deprived of the earldom of Angus and of his Scottish estates. His son and heir, Gilbert de Umfraville (1310–1381), claimed the earldom, which he hoped to gain by helping Edward Baliol to win the Scottish crown, but he failed, and on his death without issue the greater part of his English estates passed to his niece, Eleanor, the wife of Sir Henry Talboys (d. 1370), while others, including Redesdale, Harbottle and Otterbourne, came to his half-brother, Sir Thomas de Umfraville (d. 1386). Sir Thomas's son, another Sir Thomas de Umfraville (1362–1391), left a son, Gilbert de Umfraville (1390–1421), who fought on the Scottish border and in France under his warlike uncle, Sir Robert de Umfraville (d. 1436). Although not related in blood he appears to have inherited the estates in Lincolnshire of the Kyme family, and he was generally known as the earl of Kyme, though the title was never properly conferred upon him. In 1415 he fought at Agincourt; he was afterwards sent as an ambassador to Charles VI. of France, and arranged an alliance between the English and the Burgundians. He was killed at the battle of Baugé on the 22nd of March 1421. His heir was his uncle Sir Robert, who died on the 29th of January 1436, when the male line of the Umfraville family became extinct. The chronicler John Hardyng was for many years in the service of Sir Robert, and in his *Chronicle* he eulogizes various members of the family.

UMPIRE, the term used, like "referee," for a person appointed by consent to settle disputes arising between opposing parties, and particularly one chosen to see that the rules of a game are obeyed. The word itself stands for the Middle English *nompere* or *noumpere*, "a numpere" becoming "an umpire." The earlier form represents the Old French *nompere, nonpair, i.e.* not equal, odd. The Latin *impar*, unequal, was similarly used in the sense of "arbitrator."

UMRA KHAN, of Jandol (*c.* 1860–1903), a Pathan chief on the north-western frontier of India, who was chiefly responsible for the Chitral Campaign of 1895. He was the younger son of the khan of Jandol; but he killed his elder brother, seized the throne, and made himself a power on the frontier. In 1894 he held undisputed sway over almost the whole of Bajour, when his restless ambition caused him to interfere in the internal affairs of Chitral. He instigated Amir-ul-Mulk, a half-witted brother of the Chitral chief, to murder his brother Nizam-ul-Mulk, and then threw over the fratricide and supported the claims of his uncle Sher Afzul to the throne. The government of India intervened and ordered Umra Khan to leave Chitral. When he refused, the Chitral Expedition was despatched (see CHITRAL); Umra Khan was driven into exile in Afghanistan, and died there in 1903.

UNAO, a town and district of British India, in the Lucknow division of the United Provinces. The town is 10 m. N.E. of Cawnpore, on the Oudh and Rohilkhand railway. Pop. (1901), 13,109.

The District of Unao has an area of 1792 sq. m. It consists of a flat alluvial plain, lying north of the Ganges. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren *usar*, the whole being intersected by small streams, used for irrigation. The Ganges is the only navigable river in the district, while the Sai forms its north-eastern boundary. The temperature varies from about 75° to 103° in the hot season and from 46° to 79° in the cold season. The annual rainfall averages about 35 in. Pop. (1901), 976,639, showing an increase of 2·4% in the decade. The principal crops are barley, wheat, pulses, rice and millets, with some cotton, sugar-cane and poppy. The district is crossed by the main line of the Oudh & Rohilkhand railway.

During the Mutiny of 1857–58 Unao was the scene of several severe engagements between General Havelock's little army and the rebels on his march to relieve Lucknow. On the death of Raja Jasa Singh, one of the leading rebels, and the capture of his two sons, the family estates were confiscated, and the villages either restored to their former owners or given to other landholders for their loyalty.

See *Unao District Gazetteer* (Allahabad, 1903).

UNCLE, the brother of a person's father or mother, also the husband of one's aunt (*i.e.* the sister of a father or mother). The French *oncle*, which appears in Anglo-French as *uncle*, comes from a Late Latin *unculus*, a shortened form of the Latin *avunculus*, a maternal uncle, the brother of one's mother. The word is a diminutive of *avus*, grandfather. The Latin for a paternal uncle is *patruus*. "Aunt" comes through the Old French *aunte*, *ante*, corrupted into the modern *tante*, from Latin *amita*, a father's sister, a paternal aunt, the maternal aunt being called *matertera*.

UNCTION (Lat. *unctio*, anointing, *ungere*, *unguere*, to smear with ointment, to anoint; cf. "ointment," O.Fr. *oignement*, from *oigner*, mod. *oindre*, to anoint), the act of pouring, or rubbing oil, ointment or salve over or on to a person or object. The term is particularly used of the ceremonial practice of anointing with oil or unguents (see Anointing). The sacrament of the anointing of the sick in the Roman church is treated under Extreme Unction. The use of the term for religious fervour in speech has degenerated into its common meaning of exaggerated sentiment.

UNDER-CROFT, in architecture, a synonym for crypt (*q.v.*), a vaulted chamber under ground.

UNDERWRITER, one who insures ships and their cargoes from loss and damage, so called from his writing his name under the document or policy of insurance. A request to an underwriter to insure is termed the offering of a "risk," and the word risk in marine insurance is equivalent to the liability of an underwriter under a contract. When the risk is divided up among several underwriters, each signs his name individually, putting opposite thereto the amount for which he accepts liability. Each signature has the effect of making a separate contract, in the terms of the policy, for the amount set opposite the name of the underwriter. (See Insurance: *Marine*.)

UNEMPLOYMENT, a modern term for the state of being unemployed among the working-classes. The social question involved is intimately bound up with that of relief of the poor, and its earlier history is outlined in the article Charity and Charities. It is more particularly within the 20th century that the problem of unemployment has become specially insistent, not by reason of its greater intensity—for it is open to considerable doubt whether, comparatively speaking, there was not more unemployment in the organized industrial communities of the early middle ages—but because the greater facilities for publicity, the growth of industrial democracy, the more scientific methods applied to the solution of economic questions, the larger humanitarian spirit of the times all demand that remedies differing considerably from those of the past should at least be tried. In most civilized countries attempts have been made to solve this or that particular phase of the problem by improved methods. There is, however, always a great difficulty in knowing the extent of unemployment even in any one particular country. No census has ever been taken in any country of those of the whole population who were employed and unemployed on any particular day, and even if it were possible to take such a census modern conditions of industry might render its results valueless almost immediately after. It would be complicated, too, by having of necessity to include the shiftless and unemployable sections of the population, as well as those on the borderland of employment (those who are worth some sort of wage in times of pressure), while at the same time it would be necessary, to make the census of practical value, to obtain returns of the demand for labour, in order to value the true character of the supply. Such statistics are obtainable possibly only in theory, but every country makes an endeavour to obtain statistics of a sort. In England the Board of Trade, for example, has compiled valuable memoranda on the percentages of unemployment in the more important trade union groups of trades, which may be taken as a measure of unemployment in the more highly organized industries; while other memoranda throwing light on the subject deal with the amount of time lost by workpeople through want of employment and other causes; with cyclical trade depressions; the extent to which female labour has displaced adult male labour of late years; seasonal industries and industries carried on by casual labour; emigration and immigration, &c., all intimately bound up with the study of the problem. The statistics issued by the Labour Bureaus of many of the states in the United States are of considerable value, in particular, those of Massachusetts, New Jersey, New York, Connecticut and Wisconsin. Germany, France and Belgium also publish statistics, but like the figures of other countries, they far from represent the actual state of unemployment.

The actual causes of unemployment in any one country will always remain to a certain extent controversial, as will the comparative weight to be assigned to each cause. Putting aside the much disputed theories of economists as to the causes of cyclical depressions of trade, there are certain well-observed facts which present themselves in connexion with the question of unemployment, and to each one of them some contributory portion of blame may be assigned. These facts may be classified as (*a*) those over which the worker has no control, and (*b*) those which may be said to lie in the worker himself. Some of those under (*a*), of which it is impossible to give more than the more obvious examples, have, of course, been operating, especially in the United Kingdom, sometimes potently, sometimes slowly and almost unnoticed, over a long range of years. They are seasonal industries and industries carried on by casual labour. There are many industries affected by certain states of the weather or by the changes of the seasons, as the building and allied trades, the furriers' trade, confectionery trades, &c. But more important are those industries which depend largely in times of pressure on casual and unskilled labour, such as port and riverside work of all kinds, construction works and to a certain extent the iron and steel industries. Then there are a number of skilled trades which have about them continually a fringe of casual labour, for which employment is very intermittent.

Causes of Unemployment.

To quote from the report of the British Royal Commission on the Poor Laws (1909):—

"The class of under-employed includes not merely the whole of the men in such occupations as dock and wharf labour and market porters, and a waxing and waning share of the lower grades of the building operations, but also a very extensive fringe of men more or less attached to particular industries, and working at them only by way of brief and casual jobs. "To go in" for one half-day, one day, two, three, four or five days out of the five and a half is common to bootmaking, coopering, galvanizing, tank-making, oil pressing, sugar boiling, piano-making, as it is to dock-labouring, stevedoring, crane-lifting, building. Some trades, like that of the London bakers, regularly employ more men on one or two days of the week than on others. In London a large body of men is always required for the Friday night baking when the work in preparation for Saturday and Sunday is, we are told, exceedingly heavy. The usual hours of working are fifteen or sixteen instead of the ten of other nights and twice as many men are required. These Friday night men, many hundreds in number, pick up odd jobs the rest of the week. At the factory gates every night during the week, a number of men are always hanging about ready to be taken on in an emergency, or to fill the place of any man who, according to a very common custom, has "taken a night off." In busy marketing neighbourhoods, a whole class of butchers' assistants are engaged only for Fridays and Saturdays. Analogous arrangements exist in many other trades. Moreover, in every trade there are men whom the employer takes on only when he has a sudden and temporary press of business. They may be the "glut men" of the customs department or the Christmas hands of the post office. Every tramway undertaking, municipal or commercial, has its reserve of extra drivers, conductors, yard-men, washers, &c., who get a day's work now and then when they are wanted. At Liverpool, and indeed in all large towns, there is a whole class of casual carmen, who are taken on for the job as required."

Then there are the accidental circumstances which incidentally produce unemployment, such as the displacement of labour by the progress of invention and improvement. The example of the distress brought upon the hand-loom weavers by the invention of the power-loom is only one of many, but the process is continually going on. The change, for example, from horse carriages to motor cars has brought much unemployment in its train. Then there is the unemployment due to decaying or declining trades, brought about through a persistent falling off of the demand, or through some change of process or of fashion; the removal of an industry from one place to another, the displacement of adult labour by that of women and boys, the continuous migration of unskilled labour from the country to the towns, and the depression in general trade caused by the occurrence of something unforeseen, as war. Then too, there are to be added the numberless frictions of industrial life, all contributing their quota to unemployment, such as the bankruptcy of an employer, changes in management, the arbitrariness of a foreman, &c. There are also what may be termed the political causes of unemployment, which depend on the commercial policy of the nation, in so far as it adopts Free Trade or Protection.

Remedies for Unemployment.

Recognizing the existence of the problem of unemployment, and putting aside the possibility of knowing exactly its extent, we have to consider the remedies which have been advanced for its solution. These may be classified as temporary and permanent. Temporary expedients, whether in the nature of voluntary relief by individuals or organized societies, or on the larger scale of municipal or state organized relief works, more properly fall under the description of charity (see CHARITY AND CHARITIES). Two particular methods of permanent remedy, however, are especially favoured. The first of these is the establishment of a system of labour exchanges, national in character if possible, by which it is claimed that machinery would at once be set in motion for assisting that mobility which is so effective for the proper utilization of labour and which, even with the modern facilities for travel, labour so lacks at the present time. Labour exchanges would also, it is argued, facilitate the collection of data for the enumeration and classification of the unemployed. Labour exchanges have been long established in Germany. "There is a network of labour exchanges of various types. The most important . . . are the public and municipal exchanges. There are over 200 such, among the 700 odd exchanges, filling now 150,000 places a month, which report regularly to the imperial statistical officer. Practically there is a public general exchange in every town of over 50,000 inhabitants, and in a very large proportion of the smaller towns. Most of the public labour exchanges date from 1894 to 1896 or received a fresh impulse then" (Report of Commission on Poor Laws, 1909). The causes of the success of the German system of labour exchanges[1] are attributed by the Poor Law Commissioners to (*a*) the high standing given to the movement by the advocacy and practical assistance of all public authorities, town councils, state governments, imperial government, &c.; (*b*) the association through combined committees of employers and employees in the management of the exchanges; (*c*) the unequivocal character of the exchanges as industrial and not relief institutions; (*d*) the excellent arrangements for the use of telephonic, telegraphic and postal facilities by the exchanges, and (*e*) the preferential railway fares for men sent to a situation.

Labour Exchanges.

An attempt was made in England to start labour exchanges by the Labour Bureaux (London) Act 1902, which gave metropolitan boroughs power to establish and maintain bureaux, to be paid for out of the general rate. Before this act, however, certain municipalities here and there had made experiments in the way of exchanges, but they were never very successful, for they had no knowledge of what they intended to do; they were not properly staffed; they were hampered by bad rules; they were nearly all started in times of depression, exactly the wrong time to start a labour exchange, the time to start it being when trade is going up. The act of 1902 was a failure because it merely permitted, and did not compel borough councils to establish bureaux, and consequently only a very small part of the metropolis was covered, and there was no interchange of ideas amongst those established. However, a fresh attempt was made to establish exchanges over a greater part of the United Kingdom by the Labour Exchanges Act 1909. The Labour Exchanges Act defines a labour exchange as any office or place used for the purpose of collecting and furnishing information, either by the keeping of registers or otherwise, respecting employers who desire to engage workpeople and workpeople who seek engagement or employment. The act gave the Board of Trade power to establish and maintain labour exchanges in such places as they might think fit, and to collect and furnish information to employers and workpeople. An important provision of the act was the authorization of advances by way of loan towards meeting the expenses of workpeople travelling to places where employment is found for them through a labour exchange. The regulations of the exchanges provide that no person shall suffer any disqualification or be otherwise prejudiced on account of refusing to accept employment found for him through a labour exchange where the ground of refusal is that a trade dispute which affects his trade exists, or that the wages offered are lower than those current in the trade in the district where the employment is found. The act also empowers the Board of Trade to establish advisory committees in connexion with the exchanges and imposes penalties for making false statements for the purpose of obtaining employment or procuring workpeople. For the carrying out of the act the whole of the United Kingdom was mapped out into divisions, with a divisional inspector at the head of each. In all the more important towns of each division exchanges were established, classified according to the population of the town. All the exchanges are in telephonic communication either with each other or with a divisional clearing-house, the divisional clearing-house in turn being in communication with a central clearing-house in London. The advantage of the English system of labour exchanges will be found in the fact that it is a national system, with the support of the state behind it. Unless, as has been proposed, it is made compulsory in all large trades, much of its success will depend on the patronage extended to it by employers, which in its turn must be justified by the efficiency of the service rendered. Patronage by government and municipal authorities, while making an imposing addition to the returns of situations found, will not necessarily be an effective guarantee that the true objects of the exchanges are being fulfilled.

The German labour registries are of seven principal types: the private registry office, maintained by ordinary agents for purposes of gain, and occupying itself chiefly with the placing of domestic servants; the travellers' homes and relief stations, which endeavour to find situations for their inmates—their success is not great, as the better elements of the labouring classes avoid them; trade union registries maintained by trade unions to assist their members in

[1] The German system of labour exchanges is exhaustively dealt with in *Report to the Board of Trade on Agencies and Methods for Dealing with the Unemployed in certain Foreign Countries*, by D. F. Schloss (1904).

obtaining employment; gild labour registries or associations of employers (mainly small employers) for the promotion of the interests of the trade in which they are engaged; agricultural labour registries maintained in different parts of Germany by the chambers of agriculture; employers' labour registries, established as a countermove against the trade union registries—they are chiefly in industries employing large capital, particularly the metal industries; and public labour registries, established either by voluntary associations or by municipalities. These latter have been very successful and have provided the model for the English registries. In Austria labour registries have also been established on the German model by many district and municipal authorities, those of Vienna and Prague being especially successful. Switzerland has a few registries established by public authorities, notably those at Basel, Bern, Schaffhausen and Zurich. In Belgium there are a considerable number of public registries, some established by associations, some philanthropic, some political, some organized by employers, some by employees, some jointly by employers and employed. Some of these registries are in receipt of subventions granted by municipalities, while in a few cases the municipalities themselves have started registries. In France labour registries are of many types. There are the ordinary registry offices, carried on for gain, and requiring a licence from the municipal authorities. They are very numerous and according to returns to the French Labour Department fill over 1,000,000 situations yearly in various occupations. There are also registries maintained by trade gilds, by individual trade unions, by a number of trade unions jointly, by joint associations of employers and employed, by associations of employers, by friendly societies, by philanthropic institutions and by municipalities. These last are being rapidly increased, and will without doubt eventually supersede all the others. In the United States the states of Colorado, Connecticut, Illinois, Kansas, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Ohio, West Virginia and Wisconsin have established free public employment offices, and in many of the other states the private registries are under strict supervision and licensing.

Insurance against Unemployment.

The second permanent remedy is that of insurance against unemployment. Certain schemes have been tried in Switzerland, notably the voluntary municipal scheme of Berne, the compulsory municipal scheme of St Gall and a trade union scheme at Basel,[1] while there is in Germany a system of insurance against sickness, accident and incapacity (see GERMANY). Much attention has been devoted in England to the possibilities of insurance against unemployment, and in 1910 a scheme was being worked out by the government with a view to its discussion by parliament in 1911. The lines on which such a scheme must work were clearly laid down by Sir H. Llewellyn Smith, the permanent secretary to the Board of Trade, in his presidential address to the Economic Science and Statistics section of the British Association at Sheffield in September 1910.

"The crucial question from a practical point of view," said Sir H. Llewellyn Smith, "is whether it is possible to devise a scheme of insurance which, while nominally covering unemployment due to all causes other than those which can be definitely excluded, shall automatically discriminate as between the classes of unemployment for which insurance is or is not an appropriate remedy. We can advance a step towards answering this crucial question by enumerating some of the essential characteristics of any unemployment insurance scheme which seem to follow directly or by necessary implication from the conditions of the problem as here laid down.

"1. The scheme must be compulsory; otherwise the bad personal risks against which we must always be on our guard would be certain to predominate.

"2. The scheme must be contributory, for only by exacting rigorously as a necessary qualification for benefit that a sufficient number of weeks' contribution shall have been paid by each recipient can we possibly hope to put limits on the exceptionally bad risks.

"3. With the same object in view there must be a maximum limit to the amount of benefit which can be drawn, both absolutely and in relation to the amount of contribution paid; or, in other words, we must in some way or other secure that the number of weeks for which a workman contributes should bear some relation to his claim upon the fund. Armed with this double weapon of a maximum limit to benefit and of a minimum contribution, the operation of the scheme itself will automatically exclude the loafer.

"4. The scheme must avoid encouraging unemployment, and for this purpose it is essential that the rate of unemployment benefit payable shall be relatively low. It would be fatal to any scheme to offer compensation for unemployment at a rate approximating to that of ordinary wages.

"5. For the same reason it is essential to enlist the interest of all those engaged in the insured trades, whether as employers or as workmen, in reducing unemployment, by associating them with the scheme both as regards contribution and management.

"6. As it appears on examination that some trades are more suitable to be dealt with by insurance than others, either because the unemployment in these trades contains a large insurable element, or because it takes the form of total discharge rather than short time, or for other reasons, it follows that, for the scheme to have the best chance of success, it should be based upon the trade group, and should at the outset be partial in operation.

"7. The group of trades to which the scheme is to be applied must, however, be a large one, and must extend throughout the United Kingdom, as it is essential that industrial mobility as between occupations and districts should not be unduly checked.

"8. A state subvention and guarantee will be necessary, in addition to contributions from the trades affected, in order to give the necessary stability and security, and also in order to justify the amount of state control that will be necessary.

"9. The scheme must aim at encouraging the regular employer and workman, and discriminating against casual engagements. Otherwise it will be subject to the criticism of placing an undue burden on the regular for the benefit of the irregular members of the trade.

"10. The scheme must not act as a discouragement to voluntary provision for unemployment, and for that purpose some well-devised plan of co-operation is essential between the state organization and the voluntary associations which at present provide unemployed benefit for their members. Our analysis, therefore, leads us step by step to the contemplation of a national contributory scheme of insurance, universal in its operation within the limits of a large group of trades—a group so far as possible self-contained and carefully selected as favourable for the experiment, the funds being derived from compulsory contributions from all those engaged in these trades, with a subsidy and guarantee from the state, and the rules relating to benefit being so devised as to discriminate effectively against unemployment which is mainly due to personal defects, while giving a substantial allowance to those whose unemployment results from industrial causes beyond the control of the individual. Is such a scheme practicable? This is a question partly actuarial, partly administrative, and partly political. I may say that so far as can be judged from such data as exist (and those data are admittedly imperfect and rest on a somewhat narrow basis) a scheme framed on the lines I have indicated is actuarially possible, at least for such a group of trades as building, engineering and shipbuilding."

In addition to insurance against unemployment by the state, there are various voluntary associations, such as friendly societies and trade unions, which make a feature of grants to their members when out of employment.

In September 1910 the first International Conference on Unemployment was convened in Paris, the subjects of statistics of unemployment, labour registries and state insurance being the chief topics. The outcome of the conference was the formation of a society to study all phases of the problem, and to keep in touch with public and private bodies and the various governments.

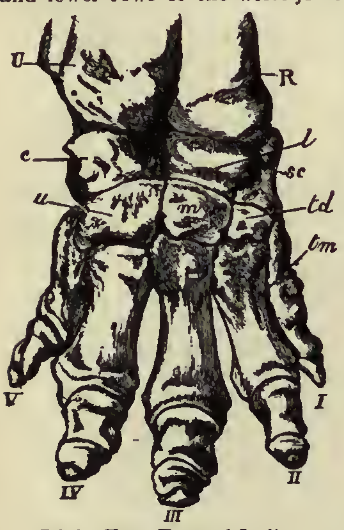
UNGAVA, an unorganized territory of the Dominion of Canada, including the north-western side of the peninsula of Labrador (*q.v.*), bounded by Hudson Bay on the W. as far S. as East Main River; Hudson Strait and Ungava Bay on the N.; and with indefinite boundaries toward Quebec on the S., and the coast strip of Labrador belonging to Newfoundland on the E. The area is estimated at 354,961 sq. m. Ungava includes much of the lower portion of Labrador, with a rim of recent marine deposits along its western coast, but the interior has the usual character of low rocky hills of Archean rocks, especially granite and gneiss, with a long band of little disturbed iron-bearing rocks, resembling the Animikie, or Upper Huronian of the Lake Superior region, near its eastern

[1] For a detailed description of these schemes see G. Schanz, *Zur Frage der Arbeitslosen-Versicherung* (Bamberg, 1895); *Neue Beiträge zur Frage der Arbeitslosen-Versicherung* (Berlin, 1897); and *Dritter Beitrag zur Frage der Arbeitslosen-Versicherung und der Bekämpfung der Arbeitslosigkeit* (Berlin, 1901).

side. Along Hudson Bay shore there is a strip of similar rocks, and a long row of small islands of the same age, with great sheets of trap or diabase forming the tops of the hills. The iron formation is widely spread. There is evidence that Ungava, like the rest of Labrador, has risen several hundred feet since the Ice Age, marine beaches being found up to 700 ft. on the Hudson Bay side; and it is interesting to find seals like those of the adjoining seacoasts in the Seal Lakes 100 m. inland and 800 ft. above the present sea-level. Owing to its northerly position a large part of Ungava is treeless, and belongs to the barren grounds where caribou roam and feed on the so-called caribou moss, a greyish lichen.

UNGULATA, the name of an order of placental mammals in which the terminal joints of the toes are usually encased in solid hoofs or covered with broad hoof-like nails, while the molar (and not unfrequently some or all of the premolar) teeth have broad tuberculated crowns adapted for crushing vegetable substances. The teeth (when all are present) are differentiated into the usual four series; and milk-teeth, not completely discarded till the full stature is attained, are invariably developed. All the existing members of the group are eminently adapted for a terrestrial life, and in the main for a vegetable diet. Though a few may in some circumstances kill living creatures smaller than themselves for food, none are habitually predaceous. In none of the existing, and in but few of the extinct types, are collar-bones, or clavicles, developed; and the scaphoid and lunar bones of the carpus are separate. The typical ungulates are the members of the suborders ARTIODACTYLA and PERISSODACTYLA (*q.v.*), in both of which the bones of the foot articulate with each other by means of groove-and-tongue joints, whence the name of Diplarthra (equivalent to Ungulata Vera), which has been proposed for these two groups collectively, as distinct from the other representatives of the order. The remaining and less typical subordinal groups—sometimes ranked as orders by themselves—include among living animals the Proboscidea, or elephants, and the Hyracoidea, or hyraxes, and among extinct groups the Amblypoda, Ancylopoda, Barypoda, Condylarthra, Litopterna and Toxodontia. The characteristics of these groups will be found under their respective headings, with the exception of the Barypoda and Condylarthra, for which see ARSINOITHERIUM and PHENACODUS.

In the great majority of the Subungulata the bones of the upper and lower rows of the wrist-joint, or carpus, retain the primitive or more typical relation to each other (see fig., and contrast with PERISSODACTYLA, fig. 1); the os magnum of the second row articulating mainly with the lunar of the first, or with the cuneiform, but not with the scaphoid. On the other hand in the Diplarthra, the group to which the vast majority of modern Ungulates belong, the second or lower row has been shifted altogether towards the inner side of the limb, so that the magnum is brought considerably into relation with the scaphoid, and is entirely removed from the cuneiform, as in most existing mammals.



Right Fore Foot of Indian Elephant. (×⅓.)

U, ulna; *R*, radius; *c*, cuneiform; *l*, lunar; *sc*, scaphoid; *u*, unciform; *m*, magnum; *td*, trapezoid; *tm*, trapezium; *I* to *V*, first to fifth digit.

In the typical Ungulata or Diplarthra, the feet are never plantigrade, and the functional toes do not exceed four—the inner digit being suppressed, at all events in all forms which have existed since the Early Eocene period. The os magnum of the carpus articulates freely with the scaphoid. The allantois is largely developed, and the placenta, so far as known, is nondeciduate, the chorionic villi being either evenly diffused or collected in groups or cotyledons (in Pecora). The testes descend into a scrotum. There is never an os penis. The uterus is bicornuate. The teats are usually few, and inguinal, but may be numerous and abdominal (as in Suina), although they are never solely pectoral. The cerebral hemispheres in existing Ungulates are well convoluted. (R. L.*)

UNICORN (Lat. *unicornis*, for Gr. μονόκερως, having one horn; Fr. *licorne*; Ital. *alicorno*), a fabulous beast, usually having the head and body of a horse, the hind legs of an antelope, the tail of a lion (sometimes horse's tail), sometimes the beard of a goat, and as its chief feature a long, sharp, twisted horn, similar to the narwhal's tusk, set in the middle of its forehead. The earliest description is that of Ctesias, who (*Indica opera*, ed. Baehr, p. 254) states that there were in India white wild asses celebrated for their fleetness of foot, having on the forehead a horn a cubit and a half in length, coloured white, red and black; from the horn were made drinking cups which were a preventive of poisoning. Aristotle mentions (*Hist. anim.* ii. 1; *De part. anim.* iii. 2) two one-horned animals, the oryx, a kind of antelope, and "the so-called Indian ass." In Roman times Pliny (*N.H.* viii. 30; xi. 106) mentions the oryx, the Indian ass, and an Indian ox as one-horned; Aelian (*De nat. anim.* iii. 41; iv. 52), quoting Ctesias, adds that India produces also a one-horned horse, and says (xvi. 20) that the *Monoceros* was sometimes called *Carcazonon*, which may be a form of the Arabic *Carcadān*, meaning rhinoceros (see Rev. W. Haughton, "On the Unicorn of the Ancients," in *Annals and Mag. of Natural History* for 1862, p. 363). Strabo (*lib.* xv.) says that in India there were one-horned horses with stag-like heads. The origin of all these statements is probably to be found partly in the rhinoceros, which was well known to the ancients, and partly in the narwhal, specimens of the long tusk of which were probably brought home by travellers. The theory of a one-horned oryx would probably be drawn from the remembrance of a passing glimpse of an antelope in silhouette, or even of one which had broken one horn off short in fighting, and E. Schrader (*Sitzungsberichte d. kgl. preuss. Akad. zu Berlin*, 1892, pp. 573–581, and pl. 5) traces the idea of a one-horned ox to the sculptures of Persepolis and other places, which Ctesias would probably have seen, in which the ox, represented in silhouette, has apparently only one horn. As India became better known, and it was realized that the unicorn was not found there, its place of abode was changed to Africa.

The medieval conception of the unicorn as possessing great strength and fierceness may have been partly due to the fact that in certain passages of the Old Testament (*e.g.* Num. xxiii. 22; Deut. xxxiii. 17; Job xxxix. 9–10) the Hebrew word *R'ēm*, now translated in the Revised Version "wild ox," was translated in the Septuagint μονόκερως, in the Vulgate *unicornis* or *rhinoceros*, and in the Authorised Version "unicorn," though in Deut. xxxiii. 17 it obviously refers to a two-horned animal. The early commentators applied to this beast the classical attributes of the μονόκερως (*e.g.* Isidore xii. 2, 12 tells how the unicorn has been known to worst the elephant in combat). There is also the passage in Aelian xvi. 20 which says that though as a rule savage and quarrelsome, even with females, the unicorn at mating time becomes very gentle to his mate, which is supposed to have given rise to the medieval idea that the unicorn is subdued to gentleness at the sight of a virgin, and will come and lay his head in her lap, which is the only means by which he can be caught on account of his swiftness and ferocity. This story is illustrated in the tapestry figured in Plate II. Fig. 10 of EMBROIDERY, also on Pisanello's medal of Cecilia Gonzaga (see J. de Foville, *Pisanello et les médailleurs italiens*, 1909, p. 40), on the reverse of which is a young girl with a unicorn lying by her side, the unicorn here being represented as a beautiful long-haired goat, with the long horn in the middle of his brow. The idea was widely spread in the middle ages, and Lauchert (*Geschichte des Physiologus*, 1889) gives instances of its allegorical use, as typical not only of Christ and the Virgin, but also of the softening influence of love upon the fiercest of men, and a symbol of purity. As a decoration of drinking cups it symbolized the ancient belief in the efficacy of the unicorn's horn against poison, which in England remained even in the time of Charles II., though Sir E. Ray Lankester (*Science from an Easy Chair*, London, 1910, p. 127) mentions that a cup made of rhinoceros horn was then handed over to the Royal Society for experiment, with the result of entirely disproving the superstition. In the court ceremonial of France as late as 1789 instruments of "unicorn's" horn were still used for testing the royal food for poison. So-called unicorns' horns, or articles made of unicorn's horn, have always been sought after as "curiosities"; some of them, like the cup mentioned above, were of rhinoceros horn; others, like the horn seen at Windsor by Heutzner, a German traveller, in 1598 (see E. Phipson, *Animal-lore of Shakespeare's Time*, p. 456), were probably narwhals' tusks. Another medieval legend about the unicorn is that when it stooped to drink from a pool its horn, dipping into the water, purified and rendered it sweet. The traditional rivalry of the lion and the unicorn, which is generally considered to date at earliest from the Union of England and Scotland, when the lion and the unicorn appeared as the supporters of the royal arms, is referred to, curiously enough, in Spenser's *Faery Queene*, ii. 5.

In heraldry the unicorn was sometimes used as a device (see Heraldry, where two English families are enumerated who used the unicorn on their arms), but more frequently as a supporter, and subsists to the present day as the left-hand supporter of the royal arms. This position it assumed at the Union, the Scottish royal arms having previously been supported by two unicorns. The origin of these is uncertain. The unicorn first appears (*c.* 1480), as a single supporter, on two gold coins of James III. of Scotland, hence known as "unicorns" and "half-unicorns" (see Lindsay, *Coinage of Scotland*, pp. 135–137 and plate xiii. figs. 22–27). It is represented in a sitting posture, having round its neck a crown, to which is attached a chain and ring, and holding the shield between its front feet. Seton (*Law and Practice of Heraldry in Scotland*, Edinburgh, 1863, p. 274, foot-note) suggests that the unicorn as a supporter may have been introduced into Scotland by the marriage of James I. with Jane Beaufort, the Beauforts as dukes of Somerset having used it as such.[1] However this may be, the unicorn became established by the end of the 15th century. J. A. Smith in "Notes on Melrose Abbey" (*Proceedings of Society of Antiquaries of Scotland*, ii. 257) describes a table dated 1505 on which are sculptured the royal arms supported by two unicorns. The royal arms are also supported by unicorns on the Great Seals of Scotland from the time of Queen Mary onwards (see Anderson, *Diplomata Scotiae*, plate lxxxviii. xc. xci.). At the Union, when the unicorn became a supporter of the royal arms both of England and Scotland, a royal crown was added on the head of the unicorn, in addition to the crown with chain and ring round its neck (see Great Seal of James I. and VI. in Anderson, pl. xciii.), but this crown was removed after the Hanoverian succession. In England after the Union the unicorn became the left-hand supporter, but in Scotland, as late as 1766, it was still put on the right (Seton, p. 442), and Scotland displayed great reluctance to alter this, or to remove the crown from the head of the unicorn. Seton tells us how in 1853 a petition was made in favour, among other things, of retaining the crown on the unicorn, but without success. The rule, however, that the unicorn is to be the left-hand supporter, uncrowned, is still sometimes ignored, and Seton states (1863) that in the case of seals, such as that of the Board of Manufactures, which bear the Scottish arms alone, the two unicorns are still kept as supporters.

Authorities.—There are many treatises on the unicorn and other fabulous beasts, from the 16th century onwards. Of these, good bibliographies are given by Drexler, *s.v. Monokeros*, in Roscher's *Lexicon*, and by Rev. W. Haughton in *Annals and Magazine of Natural History* for 1862, p. 363, "On the Unicorn of the Ancients."

(C. B. P.)

UNIFORMS. The word "uniform" (Lat. *unus*, one, and *forma*, form), meaning adjectively homogeneous, is specifically used as a substantive for the distinctive naval and military dress, which serves, in its various styles, to give homogeneity to the several services, regiments and ranks. Although in ancient history we occasionally meet with uniformed soldiers, such as the white and crimson Spanish regiments of Hannibal, it was not until the beginning of large standing armies that uniforms were introduced in modern times. Before this, armed bodies were of two sorts, retainers and mercenaries, and while the former often wore their master's livery, the latter were dressed each according to his own taste or means. The absence of uniforms accounts very largely for the significance attached to the colours and standards, which alone formed rallying points for the soldier and his comrades, and thus acquired the sacred character which they have since possessed. A man who left the colours wandered into the terrifying unknown, for there was nothing to distinguish friend and foe. Even if the generals had ordered the men to wear some improvised badge such as a sprig of leaves, or the shirt outside the coat, such badges as these were easily lost or taken off. The next step in advance was a scarf of uniform colour, such as it is supposed was worn by the "green," "yellow" and other similarly-named brigades of the Swedish army under Gustavus Adolphus. This too was easily removed, as in the example of the squire who at Edgehill put on the orange scarf of the parliamentarians and with no more elaborate disguise succeeded in recapturing the lost royal standard from the hands of Essex's own secretary. By this time, in France at least, the general character of the clothes and accoutrements to be worn on various occasions was strictly regulated by orders. But uniformity of clothing was not to be expected so long as the "enlistment" system prevailed and soldiers came and went, were taken in and dismissed, at the beginning and end of every campaign. The beginnings of uniform are therefore to be found in truly national armies, in the *Indelta* of Gustavus, and the English armies of the Great Rebellion. In the earlier years of the latter, though the richer colonels uniformed their men (as, for instance, the marquess of Newcastle's "Whitecoats" and the king's own "Bluecoats"), the rustics and the citizens turned out for war in their ordinary rough clothes, donning armour and sword-belt. But in 1645 the parliament raised an army "all its own" for permanent service, and the colonels became officials rather than proprietors. The "new model" was clothed in the civilian costume of the date—ample coat, waistcoat, breeches, stockings and shoes (in the case of cavalry, boots)—but with the distinctive colour throughout the army of red and with regimental facings of various colours. The breeches were grey. Soon afterwards the helmet disappeared, and its place was taken by a grey broad-brimmed hat. From the coat was evolved the tunic of to-day, and the hat became the cocked hat of a later generation, which has never altogether disappeared, and has indeed reverted to its original form in the now familiar "slouch-hat."

For service in Ireland the red coat was exchanged for one of russet colour, just as scarlet gave way to khaki for Indian service in the 19th century. The cavalry, however, wore buff leather coats and armour long after the infantry had abandoned them; the Austrians (see Plate I., line 1, No. 2), on account of their Turkish wars, retained them longer than any.

Thus the principle ever since followed—uniform coat and variegated facings—was established. Little or nothing of sentiment led to this. By choice or convenience the majority of the corps out of which the new model was formed had come to be dressed in red, with facings according to the colonel's taste, and it is a curious fact that in Austria sixty years afterwards events took the same course. The colonels there uniforming their men as they saw fit, had by tacit consent, probably to obtain "wholesale" prices, agreed upon a serviceable colour (pearl grey), and when in 1707 Prince Eugene procured the issue of uniform regulations, few line regiments had to be reclothed. The preferences of the colonel were exhibited in the colour of the facings (Plate I., line 1, fig. 3). In France, as in England and Austria, the cavalry, as yet rather led by the wealthy classes than officered by the professional, was not uniformed upon an army system until after the infantry. But in 1688 six-sevenths of the French cavalry was uniformed in light grey with red facings; and about half the dragoon regiments had red uniforms and blue facings. Louvois, in creating a standing army, had introduced an infantry uniform as a necessary consequence. The native French regiments had light grey coats, the Swiss red, the German black and the Italian blue, with various facings. The French grey was probably decided upon, like the Austrian grey, as being a good "service" colour, which could be cheaply manufactured (Plate I.,

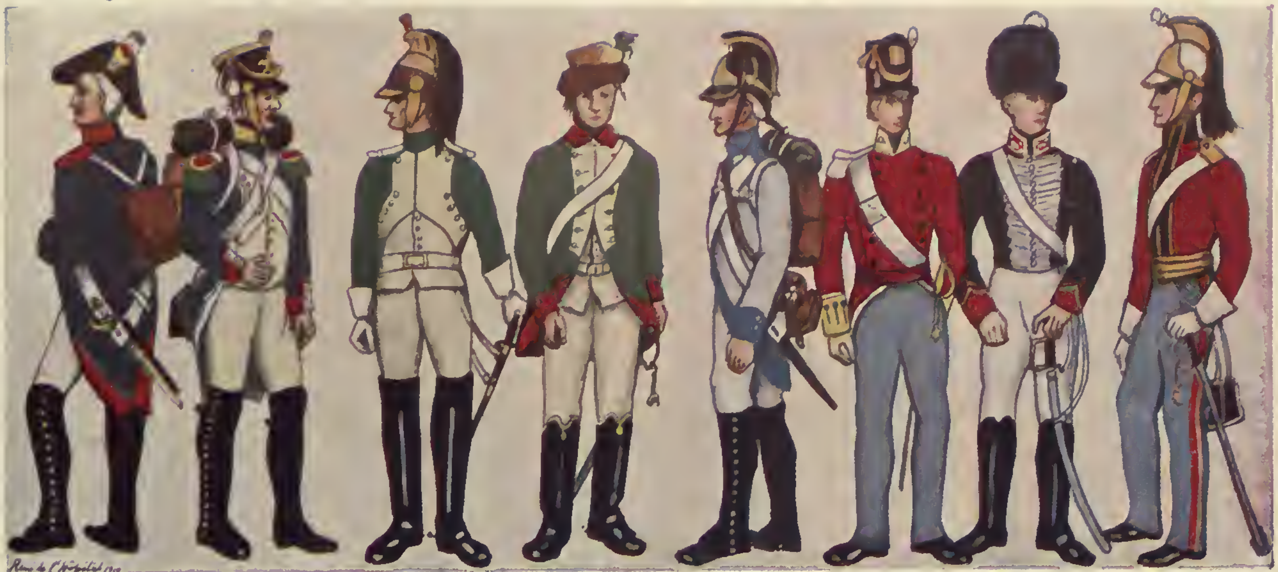
[1] Willement, *Regal Heraldry*, p. 70, says that it was also so used by Anne Boleyn and by the earls of Hertford.

UNIFORMS.

1690-1790. PLATE I.

France: Sergeant, Alsace Regt., 1690. — Austria: Cuirassier, 1705. — Austria: Württemberg Regt., 1710. — Hungary: Nadasdy Hussars, 1762. — England: 34th Foot, 1742. — England: Grenadier, 4th Foot, 1751. — Prussia: Hesse-Cassel Regt., 1756. — England: 40th Foot, 1790.

1792-1815.



France: Revolutionary Infantry, 1795. — France: Voltigeur, 51st Regt., 1806. — France: Guard Dragoon, 1806. — Austria: Uhlan, 1800. — Austria: Deutschmeister Regt., 1805. — England: 9th Foot, 1812. — England: Royal Horse Artillery, 1815. — England: 1st Royal Dragoons, 1815.

1815-1865.

England: 17th Lancers, Officer, 1845. — England: 90th Light Infantry, 1845. — Austria: Jäger, 1848 — France: Line Infantry, 1852. — Austria-Hungary: Gyulai Regt., 1856. — France: Infantry Officer, 1859. — England: Scots Fusilier Guards, Officer, 1865. — U. S. A.: General Officer 1864.

line 1, fig. 1). Both these greys, however, refined themselves in course of time into white.

The hat and the long coat and breeches remained the uniform of line infantry almost everywhere up to the advent of the shako and the coatee about 1790–1820. The gradual evolution of these two garments, from the comfortable civilian clothes of 1690 to the stiff, precise military garments of 1790, can be traced in a few words. The brim of the felt hat was first looped up on one side for convenience, then, for appearance' sake, on the other, and so became the three-cornered cocked hat, fringed with feathers, lace or braid, of Marlborough's wars.[1] Then came the fashion of looping up before and behind, which produced the hat called the "Khevenhüller," or the broadside-on cocked hat. Lastly, came the purely decorative, lace-looped "fore-and-aft" pattern, as worn in many states to-day. But before this came into vogue the cocked hat had practically disappeared from the ordinary ranks of all armies. It may be said that so long as the cocked hat survived in its simple, rank-and-file form, uniforms retained much of their looseness. Though the long skirts that rendered great coats unnecessary were looped back, and the ample cuffs of Marlborough's time were becoming narrower until they were at last sewn down to the sleeve, yet the military costume was in all essentials the civil costume of the time—long coat, hat, sleeved waistcoat, breeches and gaiters.

But other influences were at work. The principal was the introduction into armies of Slavonic irregulars, which tended to restrict line infantry and cavalry to parade drill and to pitched battles in parade order. This, and their complete separation from the civil population, stiffened their costume until it became "soldierly." Frederick the Great, indeed, could not have developed the infantry fire power that he needed if his soldiers had had tight sleeves, but in his old age the evil of sacrificing comfort to smartness attained a height which, except in the 1820–1840 period, was never surpassed. The figure of a Prussian fusilier, Plate I. line 1, No. 7 (in which by mistake a slung sword is shown) shows this process beginning. The stock has made its appearance, soon to stiffen into a cloth collar, under which, as if it were not already tight enough, another stock in due course came to be worn. The flapped cuffs, shown in the British figure No. 5, have become plain round cuffs, above which are embroidery stripes and buttons which at one time laced the flaps of the cuff together and now survive as the "guard-stripe." This may be called the first instance of the dummy adornments, which are so marked in modern full-dress uniforms. Similarly the former cloth turnback on the front of the coat has even in 1756 been cut off, the buttons and embroidered loops that retained it being kept as decorations.

Many of these specially military adornments were borrowed from the national costumes of the irregulars themselves. Their head-gear in particular drove out the cocked hat. The grenadier cap, now a towering bearskin, was its first successful rival, the shako the next. The grenadier cap was, in the first instance, a limp conical cap (identical with the hussar cap), edged with fur and having a tassel at the end. Soon the fur became more prominent in the front, and the tail disappeared. Then the cloth mitre-cap (Plate I., line 1, fig. 6) appeared. This was originally a field-service cap, with ear-flaps and sunshade. But it stiffened about 1775 into a fur cap of the same shape (with which sometimes the old cloth tail is found), and this in turn evolved, through the fuller but still narrow and forward-pointing bearskin of Peninsular days, into the great fur cap of grenadiers and fusiliers of the present time. The mitre-shaped cloth cap survives in a few Russian and Prussian regiments. As early as 1755, as the Prussian figure shows, a conical leather cap with a large brass plate in front had come into existence. This held its ground for some time, and the grenadier cap of to-day in Russia and Prussia is a metal copy of the mitre field-service cap itself. A curious derivative of the low fur cap with a peak in front and a bag-tail behind worn by some 17th- and 18th-century grenadiers is the head-dress of the Russian horse-grenadiers. The peak has become the helmet, the fur a "sausage" across the cap from ear to ear, and the back part of the helmet is covered by the bag-tail.

The Hungarian hussars introduced the jacket and the busby. The latter was originally a conical cap with fur edge, but the fur became higher until there was nothing left of the cap but the ornamental "busby-bag" of to-day. It would appear also as if the hussars brought the shako to western Europe. This is a conical, bell-topped, or cylindrical head-dress of stiff material, commonly leather. Its prototype, the tall cylindrical cap of the 18th-century hussars, was tilted on one side and wound round with a very narrow bag-tail, the last few inches of which, adorned with a tassel, hung down. But the shako itself succeeded, as nothing else succeeded, in being accepted by line infantry and cavalry, and after passing through numerous forms it remains in every army to-day, either as a low rigid cap (Germany, England and Austria), a stiffened or limp képi (France and Italy), or the flat-topped peaked cap which is the most common military head-dress of modern Europe.

All these adjuncts came in the first place from the national costume of imported auxiliaries. So also did the lancer cap, which, originally the Polish czapka, was a cylindrical cap, the upper part of which could be pushed up or down after the fashion of a bellows or accordion, with a square top. The original form is seen in Plate I., line 2, fig. 4, and the stiffened development of it in Plate I., line 3, fig. 1. The British lancer cap (Plate II., line 1, No. 2) has still a full middle portion, but in Austria and Germany this has dwindled to a very narrow neck (Plate II., line 3, No. 6; Plate IV., line 1, No. 7). The line infantry and cavalry coat, full-skirted in the first instance, retained its original length until about 1780, but from that time onwards (probably in most cases in the interests of the colonel's pocket) it becomes, little by little, shorter and scantier (Plate I., line 2, Nos. 2, 3, and 5), until at last it is a "coatee," not as long as the present-day tunic (Plate I., line 2, Nos. 6 and 8), or a swallow-tailed coat (Plate I., line 3, figs. 1–3). This, of course, did away with the protection afforded by the full skirt, and necessitated the introduction of the great coat, which even to-day in some cases is worn, without the tunic, over the "vest" that represents the sleeved waistcoat (Plate II., line 2, No. 3), formerly worn under the long skirted coat. The white breeches and gaiters, retained to the last, gradually gave way to trousers and ankle boots in 1800–1820.

Meanwhile another form of head-dress, which was purely military and owed nothing to Poland or Hungary, came into vogue. This was the helmet, which had disappeared from the infantry about 1650–1670, and the cavalry thirty years afterwards. It took two forms, both of which possessed some of the characteristics of ancient Greek and Roman helmets. These were a small helmet with sausage-shaped ornament from front to back, worn chiefly by British light dragoons and artillery (Plate I., line 2, fig. 7), and the towering crested helmet worn by the French, British and Austrians. The French cuirassiers and dragoons (Plate I., line 2, No. 3) had, and still have, long horse-hair tails dependent from the crest. The Austrian infantry helmet, worn with the white coat, similar to, but smaller than, that shown in Plate II., line 2, No. 5, had no ornament, but the British heavy cavalry helmet (Plate I., line 2, No. 8) resembled that of the French. To-day, besides the French, the Austrian dragoons and Italian heavy cavalry have this form of helmet (Plate II., line 3, No. 1, and Plate IV., line 2, No. 8).

It has been said above that the coatee and the shako are the principal novelties in European military costumes of Napoleon's time. To these should be added the replacement of the gaitered breeches by trousers, and the adoption of hussar and lancer uniforms of ever-growing sumptuousness, in which the comfort that had originally belonged to these national irregular costumes was entirely sacrificed. After Waterloo, indeed, all traces of the old-fashioned coat disappeared, and, except for the doubtful gain of tight-fitting "overalls," the soldier was more showy and worse off in comfort and convenience than ever before or since. One or two examples may be quoted. In George IV.'s time

[1] In the cavalry an iron-framed skull-cap was often worn under the cocked hat.

the coatees of the lifeguards were so tight that the men were unable to perform their sword exercise, and their crested helmet, surmounted by a "sausage" ornament, was so high that the sword could not be raised for a downward blow. The total height of the lancer cap with its plume (Plate I., line 3, No. 1) was about an arm's length, and prints exist showing British lancers in a cap of which the square top is very nearly as broad as the wearer's shoulders. The hussar furred pelisse, originally worn over a jacket (Plate I., line 1, fig. 4), and so worn by the Austrians to-day, had become a magnificently embroidered and laced garment, always slung and never worn, and the old plain under-jacket had been loaded with buttons and lace, and differed from the pelisse only in the absence of fur. It was the Restoration era, too, that delighted to decorate uniforms with sewn-down imitations of the skirt pockets, turn-back cuffs, &c., of the old coat. This was, in short, the epoch of pure dandyism, and although some of its wilder extravagances were abolished between 1830 and 1850, enough still remained when the British army took the field in the Crimea to bring about a sudden and violent reaction, in which the slovenliest dress was accounted the best. The dress regulations of 1855 introduced the low "Albert" shako and the tunic, abolished the epaulette—an ornament which had grown in the 18th century out of a shoulder cord that kept the belts in place and was decorated at the outer end with a few loose strands or tassels of embroidery—and made other changes which, without bringing back uniform to its original roominess and comfort, destroyed not only the dandyism of George IV.'s time, but also the chastened finery of the Early Victorian uniforms (Plate I., line 3, No. 7).

The tunic, accompanied by a spiked helmet of burgonet shape, had been introduced in Prussia and Russia about 1835. Russia was too poor to allow extravagance in dress, and Russians, clothed as they generally were in their great coats, had little incentive to aim at futile splendour. Both countries, however, and France and Austria likewise, passed through a period of tight, if unadorned, uniforms, before Algeria, Italy, and similar experiences brought about the abandonment of the swallow-tailed coatee. The French adopted the tunic in 1853, the Austrians in 1856, and in both countries the shako became smaller and lighter. From about 1880, when the spiked helmet replaced the low shako in England, no radical changes were made in full dress uniforms, except that the Russian army, abandoning the German pattern uniforms formerly in vogue, adopted a national uniform which is simple, roomy, and exceedingly plain, even in full dress. In 1906–1909, however, this attempt to combine handsomeness and comfort was given up, full dresses being made more decorative, and light green-grey service dresses being introduced. Lastly, since the South African War and the development of infantry fire, the attempt to wear full dress uniform on active service has been practically given up. Great Britain first of all adopted the Indian khaki, and then a drab mixture for "service dress" and returned, after 150 years, to the civilian style of field dress, adopting the "Norfolk jacket" or shooting coat with spinal pleat and roomy pockets. Germany, Italy, the United States and other countries have followed suit, though each has chosen its own shade, and the shades vary from light grey blue in Italy to deep olive drab in the United States. The details of the present-day uniforms in the principal states are given below. It might be stated, as a summary of modern uniforms, that Great Britain has most completely divorced service and full dress, and that in consequence her full dress is handsomer and her service dress plainer than those of any other country. Whether, for European war at any rate, the obliteration of regimental distinctions has not been carried too far, is open to question. The method adopted for the Italian infantry would seem to give enough means of identification, without increasing visibility, and as this method was used by the British in the South African War, it will probably be revived in future wars.

Great Britain

The full dress uniforms of the British service in 1910 had not undergone any radical change since the army reorganization of 1881. Many regiments had, however, resumed their original facings instead of the white common to all non-royal English regiments in the last twenty years of the 19th century. But the Scottish regiments maintained their yellow or yellow-buff facings, and the single Irish regiment which is not "royal" (the Connaught Rangers) its green. Rifle regiments had astrakhan busbies, resembling in shape enlarged "glengarry" caps, with plume and lines. Details in all corps have been changed, rendering the uniforms more handsome. In September 1910 it was announced that the cloth helmet would be replaced by a shako.

Cavalry.—Household cavalry and dragoons wear single-breasted tunics with gold buttons, cuffs pointed with Austrian knot collars and shoulder-straps of the facings colour and white piping on the front and the skirt-flaps. The household cavalry wear steel cuirasses in review order, and in undress tight-fitting jackets and blue red-striped overalls. All wear steel or brass helmets, with drooping horsehair plumes, except the Scots Greys (2nd Dragoons), who have a grenadier bearskin with feather plume. All wear blue pantaloons and jack boots, except the household cavalry, who in full dress wear white leather breeches and high jack boots reaching above the knee. The stripes on the pantaloons are yellow, (white in 2nd and 6th Dragoon Guards), white belts[1] and slings. See Plate II., line 1, figs. 4 and 9.

Lancers (Plate II., line 1, No. 2) wear double-breasted tunics with gold buttons, and the front or "plastron," the peculiar mark of the lancer, varies in colour with the facings of the regiment. Lancers wear lancer caps (the Polish czapka) with drooping plumes. Pantaloons are blue, with yellow stripes (white in 17th), boots as in the dragoons. Round the waist is a girdle of yellow and red, and the cap is secured to the collar of the tunic by yellow lines.

[1] The 1st Life Guards have a red line, the 2nd a blue line, in the pouch belt.

UNIFORMS.

GREAT BRITAIN. PLATE II.

15th Hussars, Officer. 12th Lancers, Officer. 10th Hussars, Officer. 2nd Life Guards, Officer. Field Marshal. Major-General. Royal Horse Artillery, Officer. Royal Field Artillery, Officer. 6th Inniskilling Dragoons Officer.

GREAT BRITAIN

Army Service Corps, Officer. King's Own Scottish Borderers. Scots Guards, Undress. Royal Fusiliers, Officer. Royal Engineers, Officer. Grenadier Guards, Officer. Welsh Regiment, Officer. Rifle Brigade, Officer. King's Own (Royal Lancaster), Service Dress. Argyll and Sutherland Highlanders.

AUSTRIA-HUNGARY.

15th Dragoons, Officer. Austrian 18th Infantry. Hungarian 82nd Infantry. General. 9th Hussars. 1st Uhlans. Artillery, Colonel. Jäger.

The undress cap is in all the above blue, with bands of various colours, amongst which the most noticeable is the white zigzag on a black background of the Scots Greys.

Hussars (Plate I., line 1, figs. 1 and 3) wear a blue jacket, shorter than the ordinary tunic, braided with yellow or gold in front, along the back seams and on the collars and cuffs. They have no shoulder-straps, facings or waist-belt. The 3rd Hussars wear, however, scarlet and the 13th white, collars. The distinctive head-dress is the cylindrical busby with an upright feather plume, lines, and a busby-bag on the right side. The pantaloons are blue, except for the 11th Hussars, who wear crimson. Double stripes on the trousers, yellow (white, 13th). The undress cap is a red peaked cap. Officers' Hessian boots have gold edging and boss.

Infantry.—The uniforms of the four Foot Guard regiments are distinguished by the cuffs, which have slashed flaps and buttons, by the blue shoulder-straps and by the embroidery patches on the collar, cuff-flaps and skirts, which are analogous to the *Garde-Litzen* of continental armies. The only uniform which could be mistaken for it is the Royal Marine Light Infantry's (Plate IV. line 3, No. 11), which has also slashed flaps, but it has fewer and smaller embroidery patches and plain collars. All the Guard regiments wear scarlet tunics with blue collars, shoulder-straps and cuffs, bearskin caps, blue trousers with red piping (officers, red stripe). The regimental distinctions (Plate II., line 2, Nos. 3 and 6) are: Grenadiers—Buttons equally spaced, white plume, red cap-band. Coldstream—Buttons spaced in twos. red plume, white cap-band. Scots—Buttons in threes, no plume, diced red and white cap-band. Irish—Buttons in fours, green plume, green cap-band. All wear in undress the white jacket, which is the old sleeved waistcoat, and peaked cap.

The uniforms of the line infantry may be classed as Line, Light, Fusilier, Rifle, Lowland and Highland Scottish. The tunic in the first three is red, with pointed cuffs and collars of the facings colour (blue in Royal regiments, white in English and Welsh, yellow in Scottish, green in Irish, except where the older colours have been revived), red shoulder-straps, gold buttons and white piping, blue trousers with red piping. On the shoulder-strap in the case of the rank and file is the regimental title, on the collar the regimental badge. The line infantry have a dark blue helmet (Plate II., line 2, No. 7), with brass spike and ornaments; the light infantry a dark green helmet of the same pattern;[1] the fusiliers (Plate II., line 2, fig. 4) bear or racoon skin cap with hackle plume. In undress all ranks have a blue (green for light infantry) peaked cap, with a black (royal regiments, scarlet, non-royal Irish, green) band. The rifle regiments (Plate II., line 2, No. 8) wear very dark green tunics and trousers without coloured cuffs or collars. In the King's Royal Rifles the scarlet piping and collar form a conspicuous distinction. The head-dress of the rifle regiments is an astrakhan cap with plume (red and black, K.R.R.; dark green and black, K.I.R.; black, Rifle Brigade), in undress a dark green peaked cap.

The Lowland and Highland Scottish regiments wear a scarlet (Scottish Rifles, green) "doublet" with gauntlet cuffs (Plate II., line 2, Nos. 2 and 10.) In undress Highland regiments wear the white jacket. Highland regiments wear tartan kilt and plaid and sporran (varying with the regiments), diced hose-tops and white spats, Lowland regiments (also Scottish Rifles, Highland Light Infantry, and all mounted officers) tartan trews. The head-dress of Highland regiments is a "feather bonnet"—a loose fur cap of peculiar shape with hackle. The Highland Light Infantry wear a small shako with a red and white diced band and ball. Lowland regiments (except the Royal Scots Fusiliers) wear the Kilmarnock bonnet (Plate II., line 2, No. 2). The Scottish Rifles have a shako with black drooping plume. The undress cap of all Scottish infantry is the "glengarry."

The full dress of officers is similar to that of the men, but it is more ornamented (see below for badges of rank). In all English and Irish regiments clothed in scarlet a crimson waist-sash is worn by officers. Guards officers on ceremonial occasions wear a gold and crimson sash. On the collar and cuffs there are broad edgings of lace terminating in the case of the cuffs in a small Austrian knot. The rifle jacket is of hussar pattern with black embroidery and a black pouch belt (Plate II., line 2, fig. 8.) The Highland officer has a special pattern of sword; in full dress the basket-hilted claymore (so-called) or a plainer sword decorated with ribbon, on service a plain cross-hilted sword. He has also a richly decorated dirk, a broad white baldric, and a very full sash over the left shoulder. Lowland officers have also the shoulder belt and claymore, &c.

Royal Artillery.—The Royal Horse Artillery (Plate II., line 1, fig. 7) wears an old-fashioned hussar uniform, consisting of busby with red bag and white plume, a blue jacket with 18 rows of gold braid and scarlet collar. Trousers blue with red stripe. The Royal Field and Royal Garrison Artillery (Plate II., line 1, No. 8) wear a blue tunic with red collar and gold lace (Austrian knot on the sleeve), blue trousers with red stripe, helmet with brass plate and ball ornament, waist-belt and pouch-belt (white for men, gold for officers). The badge is either a grenade or a device of a field gun on its carriage.

[1] To be replaced by a shako.

	Facings.	Corresponding Corps and their facings in 1815. (S = silver lace.)
Line Infantry, English and Welsh.		
Queen's (R. West Surrey)	Blue	2nd, blue (S).
Buffs (East Kent)	Buff yellow	3rd, buff (S).

Princess Louise's (Argyll and Sutherland Hrs.) . . .	Yellow	91st, yellow (S). 93rd, yellow (S).

Royal Engineers (Plate II., line 2, No. 5).—Scarlet tunic with garter, blue cuffs and collar, yellow shoulder-cords and piping, blue trousers with red stripe, helmet with royal arms on plate, and spike. Waist-belt white for men, gold-laced russia leather for officers, who wear also a pouch-belt of russia leather with a wavy gold lion in the centre.

Army Service Corps (Plate II., line 2, No. 1).—Blue tunic with white facings and white piping. Helmet with ball and plate, trousers blue with double white stripe. Officers, gold belts. *Royal Army Medical Corps*, blue uniform with magenta facings; *Army Veterinary Corps*, blue with maroon facings; *Army Pay Corps*, blue with yellow facings; *Army Ordnance Corps*, blue with red facings. *The West India Regiment* (negroes) wear a red sleeveless jacket over a white smock, baggy dark blue trousers, and a round cap with white puggaree.

The distinguishing mark of the *staff* officer in full dress is the aiguillette and the cocked hat with upright or drooping plume; in undress and service dress the red gorget patches on the collar. The full-dress uniforms of a *field marshal* and a *general officer* are shown in Plate II., line 1, Nos. 5 and 6.

Badges of Rank.—All officers have twisted gold shoulder-cords (except Foot Guards, who wear a blue cloth shoulder-strap with lace edges); on these cords badges of rank are worn as follows: 2nd lieutenant, lieutenant and captain, 1, 2 and 3 stars; major, crown; lieutenant-colonel, crown and star; colonel, crown and 2 stars; brigadier-general, crossed swords; generals, sword and baton crossed, and (major-general) star; (lieutenant-general), crown; (general), crown and star; field marshal, crossed batons in a laurel wreath with crown above. In service dress (khaki), however, the badges are worn in worsted on a slashed flap of the sleeve, coupled with rings of braid (1 for a 2nd lieutenant or lieutenant, 2 for a captain, &c.). Non-commissioned officers wear chevrons (point downwards) on the upper right arm; lance-corporal or acting bombardier, 1; corporal, 2; sergeant, 3; colour-sergeant, 3 chevrons and crossed colours; staff-sergeant, 4 chevrons. On the lower part of the left arm chevrons (point up) are worn as "good conduct" badges. A sergeant-major is dressed as an officer, except that he has a crown on the lower part of the right sleeve). There are also badges of proficiency such as crossed rifles for marksmen, a spur for rough-riders, a fleur-de-lys for scouts, &c.

Regimental Badges.—The grenade in various forms is worn by the Royal Artillery, the Grenadier Guards and the Fusilier regiments. The figure of Britannia was awarded to the (9th) Norfolk regiment for gallantry at Almanza, 1707. The White Horse of Hanover was given to some regiments for service against the Jacobites. The Lion of England was awarded by William III. to the King's Own (Royal Lancaster) Regiment for services against the troops of James II. The Queen's (Royal West Surrey) Regiment wear a Paschal Lamb, the badge of Catherine of Braganza, queen of Charles II. The Dragon of Wales figures among the badges of all the Welsh regiments. Several regiments wear a castle and key in memory of services at Gibraltar, others have a tiger for services in India and still more a sphinx for Egyptian campaigns. The most general of all badges—though not the most generally worn—is the "stripped" rose. Nearly all corps possess several badges, which are combined in various ways.

The special interest of these badges is that they are peculiar to the British army. Although a badge of the branch (infantry, cavalry, &c.) is common, no other army wears distinctive regimental devices.

A few details of general practice may be added. All cavalry wear a pouch-belt over the left shoulder. The crimson infantry sash is worn by officers round the waist and by sergeants across the body and over the right shoulder. All officers and sergeants who do not wear the sash, to whatever branch they belong, have a pouch-belt, the pattern of course varying. Ankle boots (and sometimes leggings with them) are worn by dismounted men. Swords, except in the case of Scottish infantry, are worn suspended by slings from a belt (the belt in infantry, rifles and hussars being worn under the tunic or sash). On foreign service the uniform is varied according to circumstances, the most usual change being from the full dress head-dress to the white helmet.

The full dress of the territorial army varies greatly, sometimes conforming exactly to the uniform of the corresponding regular units, sometimes keeping to its original "Rifle" character in grey or green of various shades. The latter conform to the rules of the dress of "Rifles" (*e.g* wear pouch-belts instead of sashes), and the former, though in many cases the silver lace and ornaments of the old volunteer force are retained, to those for the regulars, the distinguishing mark in all cases being the letter "T" on the shoulder or collar. The yeomanry cavalry is variously attired, some old regiments possessing rich old-fashioned hussar uniforms, others of recent formation wearing "service" colours only. Some regiments are dressed as dragoons, but the great majority are hussars. The infantry and artillery of the Honourable Artillery Company of London are dressed somewhat after the fashion of the Grenadier Guards and the Royal Horse Artillery.

Undress Uniforms.—In "walking-out" order most troops wear the tunic, Household Cavalry and Dragoons with waist-belts and sword-slings, lancers with girdle (R.F.A. and Army Service Corps also wear girdles in walking-out order), infantry and all other branches except hussars with waist-belt. Sergeants of infantry wear the sash and side-arms, the latter privilege being accorded also to corporals of the guards regiments. White gloves are worn by sergeants. Since the general introduction of khaki service dress, undress uniforms of red, blue, &c., have mostly disappeared, but the blue serge "jumper" is still retained. Officers of infantry (except in hussars and Rifles) have undress frock coats of various patterns. With these the "Sam Browne" equipment brown leather waist-belt, frog and the sash and slings are worn, but with the jumper and service frock, braces. Field officers have an edging of braid on the peak of the undress caps, staff and general officers an oak-leaf design.

Service Dress.—This, since the conclusion of the Boer War, is universally khaki serge, of shooting-coat pattern, with a spinal pleat and four large pockets; all buttons and badges are in bronze. It has a double collar. A peaked cap, breeches or trousers, and puttees of the same colour are worn with it. The universal pattern great-coat and macintosh are also khaki coloured. The guards and staff officers, however, wear a light grey overcoat.

Mess Dress, for officers, after undergoing various modifications, now almost universally consists of a jacket with roll collar, waistcoat, and overalls and patent leather Wellington boots, the colours following in the main those of the full dress.

It remains to mention a few of the many regimental distinctions, trifling in themselves yet of the greatest importance as fostering regimental pride and as recalling specially gallant services in the old wars. The officers of the 7th Hussars and the Oxfordshire and Buckinghamshire Light Infantry wear linen collars with their undress uniforms. The Royal Welsh Fusiliers have a bow of black velvet (called a "flash," this being an obsolete slang word for "wig") sewn to the back of the collar—a survival of the old-fashioned method of tying the hair in a club queue. The officers of certain regiments, in memory of severe losses, wear a black line in their gold lace. To commemorate Culloden the sergeants of the Somersetshire Light Infantry wear their sashes over the left shoulder as officers used to do. Until after the South African War the only fusilier regiment that wore plumed busbies was the Northumberland Fusiliers; now, however, all fusiliers wear a hackle (in the order of regiments shown in the table: red and white; white; primrose; white; white; grey; green; white and green; blue and green). The (28th) Gloucestershire regiment wears two badges on the helmet, to commemorate its having fought facing both ways, ranks back to back, at Alexandria in 1801.

Indian Native Army.—The uniforms of the Indian army vary infinitely in details, owing to the different methods of tying the turban, &c., practised by different castes and tribes, and to the strictly regimental system of clothing and equipping the soldier. But the infantry, except the Gurkha Rifles, have tunics of similar pattern, viz. long skirted, without collars, and (if scarlet) with round cuffs, flaps and broad edgings on the front of the tunic of the facings colour. The trousers are dark blue and wide, and spats are worn with them (Plate III., line 3, No. 4). Gurkhas (Plate III., line 3, No. 5) are dressed as Rifles, except that their head-dress is a round cap. The pattern of cavalry uniform, which is generally followed whatever the colours and regimental distinctions, is shown on Plate III., line 3, No. 3.

In the main the dress of the native cavalry is dark blue. Five of the regiments wear red, the three Madras corps French grey, the Hyderabad and one other green, and only three drab. One regiment, the 1st, wears a yellow uniform, being perhaps the only one so clothed in the world.

Native artillery units wear blue with red facings, native engineer units, red with blue facings. The Queen's Own Corps of Guides wears drab with red facings.

The greater part of the infantry wears, in full dress, scarlet, the various facings following no discoverable system, although certain groups of regiments have a regular colour scheme.

A large number of regiments are clothed in drab, and there are Gurkha and other rifles in green; the remarkable Baluchi uniforms (green and drab with baggy red trousers) are unique in the British Empire.

The regiments of the *Australian Commonwealth*, with certain exceptions, wear khaki or drab with white facings and emu plume in the cavalry and green facings in the infantry. The same principle is carried out in other services, the intelligence corps having pale blue, the signal corps royal purple, the medical chocolate and the veterinary maroon facings. The artillery, engineers and army service corps are dressed as the corresponding branches of the home army. All the *Canadian* forces are uniformed very similarly to the British army. The 6th Dragoon Guards and the 13th Hussars are the models for the cavalry, and line, rifle, highland and fusilier uniforms are all represented, the dark rifle uniform predominating. In *South Africa*, as in Australia, khaki has become almost universal.

France

The Revolutionary simplification of the varied uniforms of the *Ancien Régime* has endured to the present day. Even in the various waves of flamboyant military fashions they have remained simple in the sense that all troops of an arm or branch were dressed practically alike, with none of the regimental differences that England, deferring to tradition, and Germany, systematizing the *ordre de bataille* to the last detail, preserved and introduced.

The line infantry wears a single-breasted blue tunic with red collar, a small red flap on the cuff, red epaulettes and gold buttons. The number of the regiment appears on a blue collar patch. The cap is a madder-red képi, with blue band, brass grenade, tricolour cockade and a ball. The trousers are loose, madder-red, and worn either with shoes and gaiters or with high ankle boots. The men usually march in the blue double-breasted greatcoat, under which is worn the plain *veste* (Plate III., line 2, No. 1). With this is worn a képi without ornaments and having the number in front. The officers wear a tunic of a different blue, almost black; otherwise, except for rank badges, it is similar to the men's; epaulettes and braid, gold. The officers' full dress képi has a golden ball and the trousers have a black stripe (Plate III., line 1, No. 1).

The chasseur battalions (Plate III., line 2, No. 2) wear the same pattern of tunic as the line, but the collar and cuffs are self-coloured, the epaulettes green, the trousers grey-blue with yellow piping, képi dark blue with yellow edgings and green ball, buttons, &c., silver. Chasseur officers are dressed as the men (with the usual officer's blue-black tunic), but have a drooping green plume. The Alpine battalions wear a plain dark blue jumper and soft cap (*béret*) or tam-o'-shanter. Under the jumper, which is usually half-open, they wear a light blue shawl round the waist. The trousers are wide, dark blue knickerbockers, and puttees are worn with them.

The Zouaves (Plate III., line 1, No. 8) wear dark blue red-trimmed jackets and waistcoats, with a light blue cummerbund, baggy red trousers with blue piping and dark blue or white spats. The head-dress is a red tasselled cap (*chéchia*). The "false pockets" round which the braid circles on the front of the jacket are red for the 1st, white for the 2nd, yellow for the 3rd and blue for the 4th Zouaves. Zouave officers have the ordinary officer's tunic, with blue-black collar and gold ornaments, but wear it unbuttoned (showing a red cummerbund) and without epaulettes. The cuff is pointed and slit almost to the elbow, the edges of the slit being gold laced according to rank and having a scarlet lining. Only the service képi is worn. The red trousers have the usual black stripe, and are cut very wide.

The Turcos are dressed similarly to the Zouaves, but with light blue jackets and waistcoats, light blue or white trousers, red cummerbund and yellow braid; the four regiments are distinguished among themselves in the same way as the four Zouave units. Their officers have a light blue tunic with yellow collar, Zouave cuff, red trousers with light blue stripe; képi red, with light blue band.

The Foreign Legion is dressed as line infantry, with certain minor distinctions. The colonial (formerly marine) infantry wears a double-breasted tunic with gold buttons, blue grey trousers and dark blue képi with red piping, plain collar and cuffs. The full dress cap badge is an anchor.

Cavalry.—Cuirassiers (Plate III., line 1, No. 3) wear dark blue tunics with red collars and cuff-flaps, silver ornaments and steel cuirasses, steel helmet with brass ornaments, black horsehair tail, red "shaving-brush" at the front of this tail and another shaving-brush, of colour varying with the squadron, &c., on the left side of the helmet. The trousers are red (officers with dark blue stripes, men with blue piping). The number is borne on a blue collar patch. The officers wear silver, the men red, epaulettes. Undress cap as infantry, silver-laced for officers.

Dragoons wear blue tunics (the black-braided "dolman," shown on Plate III., line 1, No. 6, is gradually passing out of the service) with white collars and cuff-flaps, silver buttons, &c., helmet as for cuirassiers, but without the "shaving-brush" at the front of the horsehair tail, trousers red with dark blue stripe. The men wear shoulder-cords instead of epaulettes, and the officers only wear their silver epaulettes on ceremonial duties. The number appears on a blue collar patch. Undress cap as for cuirassiers.

Chasseurs à cheval (Plate III., line 1, No. 7) wear a light blue tunic or dolman (the latter black-braided) with silver buttons, red collars and cuff-flaps. The trousers are red with light blue piping (two broad and one narrow light blue stripes between for officers). The full dress head-dress is a light blue shako, with dark green plume in full dress, coloured ball in other orders. The badge on the shako is a brass bugle. The képi is red with light blue band and piping (silver braid for officers). Number on the collar.

Hussars are dressed as *chasseurs à cheval*, but with white braiding on the dolman instead of black, and self-coloured collar. The badge on the shako is an Austrian knot.

The *Chasseurs d' Afrique* wear the half-open *veste*, which is light blue with yellow collar and edgings. The cuff is slit in the Zouave style, the visible lining being yellow. A red cummerbund is worn. The shako is almost invariably worn with a white cover and neck curtain. The trousers are red. Officers as the corresponding chasseur officers in France, but with yellow instead of red collars, &c.

The native Algerian cavalry, the *Spahis*, wear national costume—red jacket with black braiding, red cummerbund, light blue wide trousers, and red morocco boots. Above this they wear a flowing red mantle of thick cloth, and over this mantle the ample white burnous, which covers the head and shoulders. Their French officers wear a red tunic, with self-coloured collar and cuffs, gold buttons and epaulettes, number with crescent in gold on the collar, gold rings on cuff according to rank, trousers as for the hussars, &c., in France.

Artillery.—The rank and file wear blue tunics or dolmans (more usually, however, the *veste*). The dolman has black braiding but a red shoulder-cord, and has red collar, with black patch and number, and red pointed cuffs; buttons, &c., gold. The trousers are dark blue, with two broad and one narrow red stripe. The képi is dark blue, with dark blue band and red ornaments, the full dress cap having a badge, in red, of crossed guns and grenade. Artillery officers wear a black-braided dolman (blue-black) with gold shoulder-cord and Austrian knot. Their képi has the artillery badge in brass, gold braid, and a red plume. Plate III., line 1, No. 5 shows an artillery officer serving on the general staff.

Engineers, dark blue tunic with gold buttons, black red-edged collar patches bearing the number in red, black red-edged flap on cuffs; red epaulettes, trousers and képi as for artillery. Engineer officers have the same tunic as infantry, without facings, and the engineer badge (a cuirass and helmet) on the full dress képi.

Train (Army Service Corps), blue-grey dolman, black-braided, with red collar, black braid on the cuff, and red shoulder-cord; infantry képi, officers as officers of the *chasseurs à cheval* but with (silver) Austrian knot on the sleeve, and red plume. Medical officers have dark blue dolman, red trousers with black stripe, and red collars and cuffs. Their distinctive marks are a whole red képi (with gold braid), a white armlet with the red cross, Aesculapius' staff on the collar, gold-laced shoulder-strap, and a curious pouch-belt which is entirely wrapped in a red cloth cover that buttons over it.

Generals wear in full dress the uniform shown in Plate III., line 1, No. 4, with some distinctions of rank. In undress they wear a dark blue jacket with black braiding, the black Austrian knot on the sleeve carrying the silver stars of rank; trousers red with black stripe; képi red, with a blue band covered by gold, oak leaf lace. General staff officers (see Plate III., line 1, No. 5) wear their regimental uniform, with gold or silver aiguillettes, and on the collar, instead of the regimental number, the thunderbolt badge of the staff, the badge or number being removed also from the képi. Their special distinctions are the armlet and the plume, which vary according to the staff to which the officer belongs.

Badges of Rank.—General officers (on the epaulette or on the Austrian knot), one silver star for general of brigade, two for general of division. Other officers (rings on the cuff and képi band, or strands of braid on the Austrian knot), 1 for sub-lieutenant, 2 for lieutenant, 3 for captain, 4 for commandant, 5 (3 gold and 2 silver) for lieutenant-colonel, 5 for colonel (Plate III., line 1, figs. 1 and 5). Epaulettes: sub-lieutenant, 1 with fringe on right shoulder and 1 scale on left; lieutenant, fringed on left and scale on right shoulder; captain, both fringed; commandant, as sub-lieutenant but with thicker fringe; lieutenant-colonel and colonel, both with thick fringes (in the case of the lieutenant-colonel the body is silver). The vertical braids of the képi also vary according to rank. Field officers as a rule wear in full dress "shaving brush" plumes instead of a ball.

Under-Officers.—The badge is a stripe crossing the lower half of the sleeve diagonally; lance-corporals 1, corporals 2 worsted stripes; sergeants 1, sergeant-majors 2 gold or silver stripes. The "adjutant," who corresponds to the British sergeant-major, has a ring of lace, like an officer's, but narrower.

Germany

The infantry of the Prussian Guard wear single-breasted dark Prussian blue tunics with red piping on front and skirt flaps, or gold buttons (1st and 5th Foot Guards and Guard Fusiliers silver), white belts (3rd or "Fusilier" battalions and the Guard Fusiliers black), red collars and cuffs, spiked helmets with, in full dress, white plumes (Guard Fusiliers black). Guard distinctions throughout Germany take the form of "guard-stripes," collar stripes of embroidery, and similar stripes forming false buttonholes round the buttons on the cuff, whether these are of the "Brandenburg" (plain flap with 3 buttons), "French" (slashed flap with 3 buttons), or "Swedish" (round cuff with buttons along the top edge) pattern. The 1st to 4th Foot Guards have two guard-stripes on the collar, Swedish cuff with stripes, and white, red, yellow and light blue (the ordinary German indicative sequence) shoulder-straps. The Guard Fusiliers have the same uniform with yellow shoulder-straps and plume and belt as stated above. The 1st to 4th Grenadier Guards have double guard-stripes, red "Brandenburg" cuffs with blue flaps and embroidered stripes, shoulder-straps coloured in the same order as the Foot Guards. The 5th Foot Guards and 5th Grenadier Guards (of later formation) wear only a single guard-stripe; these return to white shoulder-straps in the sequence, and both have the blue flap and stripes. Service cap as in the line. For gala wear the 3rd battalion of the 1st Foot Guards, and all battalions of the 1st Grenadier Guards, wear the old mitre cap, once of cloth, but now become rigid and consisting of a metal front plate and a stiff red cap behind it.

The line infantry (other than Bavarians, Saxons, Württembergers, &c.) wear blue tunic with gold buttons, red piping, and red collar. The cuffs, also red, are of the "Brandenburg" pattern, plain round with a small red flap. The shoulder straps bear the number, or cipher. The head-dress is a small black leather helmet with brass Prussian eagle badge and spike. The trousers are dark grey with red piping, the equipment of black leather, the boots of Wellington pattern (the trousers being tucked into them). The greatcoat is grey with shoulder-straps as on tunic and a collar patch of the cuff-flap colour. The service cap is a round cap without peak, dark blue with red band and piping, and two cockades, "national" and "imperial." Exceptions to these rules are: Prussian grenadiers (Nos. 1 to 12) wear black horsehair plumes and white belts, Mecklenburg grenadiers No. 89, Queen's Fusiliers No. 86, Brunswick regiment No. 92, 145th Prussian regiment, black plumes.

The Prussian and quasi-Prussian portions of the army follow a clear rule as to the badge of the army corps. The infantry of each corps has shoulder-straps of uniform colour, and when a regiment changes its corps it changes its shoulder-strap. There is a further distinguishing mark on the cuff-flap:—

	I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Shoulder-strap	White	White	Red	Red	Yellow	Yellow	Lt. blue	Lt. blue
Cuff-flap piping . . .	White	Nil	White	Nil	White	Nil	White	Nil
	IX.	X.	XI.	XV.	XVI.	XVII.	XVIII.	XX.[1]
Shoulder-strap	White	White	Red	Red	Yellow	Yellow	Lt. blue	Lt. blue
Cuff-flap piping . . .	Yellow	Lt. blue	Yellow	Lt. blue	Yellow	Lt. blue	Yellow	Lt. blue

Except in regiments (such as the guards of the smaller states now numbered in the line of the army, and a few others) where the blue flap and guard-stripes are worn, the greater part of the Prussian regiments wear the historic red flap; but there came a time when the system of indicating regimental variations had to be expanded, and thereafter (from No. 145 inclusive onwards) red and white flaps were given alternately to new regiments, in such a way that there was one "white" regiment in each corps. The I. corps on the Russian frontier, being further reinforced, received one regiment with a yellow (150th) and one with a light blue flap (151st). "Guard" distinctions are worn by the Mecklenburg Grenadiers, No. 89, double guard-stripe on collar, blue cuff-flap with red piping and embroidery; by the 7th Prussian Grenadiers, single guard-stripe and blue flap with embroidery (edged with V. corps colour); by the 1st, 2nd, 3rd and 8th Prussian Grenadiers and by the 80th Fusiliers (formerly the elector of Hesse's bodyguard), single guard-stripe and embroidery on the ordinary red cuff-flap.

The infantry of Hesse-Darmstadt, Württemberg and Baden are similarly uniformed to those of Prussia, the distinctions being easily described. The five "Grand Ducal Hessian" regiments (115–118 and 168) have not the corps (XVIII.) distinction, and have both shoulder-straps and cuff-flap of the same colour (red, white, light blue, yellow and red), the senior regiment, 115 (bodyguard regiment), having double guard-stripe on the collar and guard patches on the flap. A very marked distinction is in the buttons, which are invariably silver, and in the helmet badge, which is a lion rampant. The first three regiments wear a black plume.

Of the Württemberg infantry (XIII. corps), the 119th and 123rd regiments (guards) wear the double guard-stripe, and the "Swedish" cuff, also plumed helmets. The remainder have red shoulder-straps and red cuff-flaps edged with light blue, like the XV. army corps, and the only conspicuous distinction is the royal arms instead of the eagle on the helmet. The 120th also wears the grenadier plume.

Of the Baden regiments, the 109th and 110th (guards and grenadiers) have white plumes and white shoulder-straps, the 109th having the Swedish cuff with patches, the double guard stripe, and silver buttons. The remainder have yellow, red, light blue and green shoulder-straps; there is no edging to the flap. The only distinguishing mark for these is the Baden device (a griffin and a shield) on the helmet.

The Saxon infantry, though assimilated to the Prussian in most respects, is distinguished by various well-marked peculiarities. All shoulder-straps are self-coloured and edged with red. All Saxon regiments have either the "Swedish" or more usually the so-called "German" plain round cuff (red), with two buttons on back seam. The guard and grenadier regiments, 100th and 101st, have black plumes, double guard-stripes and "Swedish" cuffs. The helmet has an eight-pointed brass star. The 108th is a rifle regiment, and wears a green tunic with black red-edged collar and cuffs, dark grey trousers and a shako with black plume looped to one side in the Austrian fashion. The service cap of this corps is green with black piping and band. A peculiarity of the Saxons is that the bottom edges of the tunics are edged with red, as well as the front, and the skirt flaps are very short.

The Bavarian infantry has retained its historic light blue uniform, though in most details the Prussian model has been accepted. Tunic and trousers are light blue with red piping, red cuffs, collars and shoulder-straps. The Bavarian bodyguard regiment has red collar with double guard-stripe, red Swedish cuff with stripes, red shoulder-straps and silver buttons, but no plume. The line has gold buttons and appointments and "Brandenburg" cuffs, flaps edged according to the usual sequence (I. corps white, II. none, III. yellow). The service cap is light blue with red band and piping. Belts black.

Jägers and *Schützen*.—The Jäger uniform is bright green, with red collars, piping and Swedish cuffs (Prussian Guard, double guard-stripe and cuff-stripes), gold buttons, trousers as for line, and a small shako with drooping black plume. The Mecklenburg battalion No. 14, however, has light green collars, cuffs and shoulder-straps edged with red, and double guard-stripe and cuff-stripes. The Guard Schützen battalion (originally a French-speaking corps from Neuchâtel) has black collars and cuffs, edged with red shoulder-straps, double guard-stripe and green red-edged "French" (*i.e.* slashed) cuff-flaps with stripes; and the Jäger battalions of the XII. and XVIII. corps have exactly the same uniform as the Saxon Schützen regiment already mentioned, silver buttons being substituted for gold. The Bavarian Jäger battalions have light blue uniforms with green facings, Swedish cuff, and shako. In all these the field cap is of the colour of the uniform, the band of the colour of the collar, the piping as on the tunic.

Cavalry.—The heavy cavalry consists of the Prussian *Gardes du Corps* and Guard Cuirassiers, the eight line cuirassier regiments, and the Saxon and Bavarian "heavy cavalry." In most of these cuirasses of black or bright iron or of brass (with or without breast decorations), and even cuirass-shaped remnants of the old buff coat, in richly decorated leather, are worn on ceremonial occasions. The head-dress is a helmet of burgonet shape. The ordinary full dress of Prussian cuirassiers is a white long-skirted tunic (called a *Koller*) with white shoulder-straps and collars, edged along the collar and down the front (which is hooked, not buttoned) with broad braid (white, with lines of the regimental colour). The Swedish cuffs, edged with similar braid, are of the regimental colour, of which colour there is also a patch on the collar and piping round the shoulder-straps and back seams. In full dress white trousers, otherwise dark grey trousers with red piping, are worn. The undress tunic is dark blue of the ordinary buttoned pattern, but with braided cuffs, white shoulder-strap and collar-patch and braid as in full dress. The field cap is of the tunic colour with band of the regimental colour. The belts are white. High jack-boots are worn. The guard regiments have double guard-stripe and cuff-stripes.

The Saxon heavy cavalry wears light blue braided cuirassier tunics, with brass scales instead of shoulder-straps, white piping, brass helmets with the Saxon star device, Swedish cuffs cut gauntlet-wise, white or light blue trousers, light blue cap, and white belts. In the 1st Guard regiment the collar and cuffs are white, the braid light blue and white, the helmet ornament a silver lion, the cap-

[1] Not yet formed.

6 ,,	Brass with silver spike	Dark blue	Poppy-red	,,
7 ,,	Steel with brass spike	Yellow	Yellow	,,
8 ,,	,,	Green	Green	,,

The line dragoon regiments, other than those of Oldenburg, Mecklenburg, Baden, Württemberg, and Grand Ducal Hesse (Saxony and Bavaria have no dragoons) wear light blue tunics with collars, shoulder-straps (with number), piping and cuffs of the regimental colour. The cuffs are Swedish. The trousers are blue-black without stripe. The helmet is black leather, very similar to the infantry helmet, with black horsehair plume. The regimental distinctions follow a regular scheme thus:—

Regiment.	1	2	3	4	5	6	7	8
Facing . . .	Scarlet	Black	Pink	Yellow	Scarlet	Black	Pink	Yellow
Collar edging	Lt. blue	Lt. blue	Lt. blue	Lt. blue	Lt. blue	Lt. blue	Lt. blue	Lt. blue
Buttons and ornaments.	Gold	Gold	Silver	Silver	Silver	Silver	Gold	Gold

Collar edging	Lt. blue	Lt. blue	Lt. blue	Lt. blue	White	White	White	White
Buttons and ornaments.	Gold	Silver	Gold	Silver	Gold	Gold	Silver	Silver

The 17th and 18th (Mecklenburg) have respectively scarlet facings and gold buttons, and black facings with silver buttons. They have the double guard-stripe and cuff stripes. The 19th (Oldenburg) have the ordinary uniform with black facings and silver buttons, but white shoulder-straps.

The Baden regiments (20, 21 and 22) have light blue uniforms with scarlet, yellow and black facings, light blue, light blue and red edgings, and silver buttons. They have white plumes instead of black, and the Baden device on the helmet. The Hessian regiments (23 and 24) have dark green tunics; the 23rd have double guard-stripe, cuff stripes and scarlet facings; the 24th the ordinary tunic with white facings, and both silver buttons. The Württembergers (25 and 26) have white and yellow facings respectively, collar edging light blue, buttons gold and silver respectively; the 25th regiment has double guard-stripe and cuff stripes, and white plume. Belts are white throughout, except in the Hessian units, which have black.

The Prussian Guard Dragoons have light blue uniforms and red facings, double guard-stripes, and cuff stripes. Buttons gold in the 1st, silver in the 2nd. White plumes.

The uniforms of the eight Bavarian regiments of *Chevaulegers* resemble those of dragoons. They wear the black dragoon helmet and white plumes, dark green tunics, trousers and undress cap, and white belts. They also have the dragoon cuffs. But they have the double-breasted lancer tunic with front and piping of the regimental colour; crimson 1st and 2nd; pink 3rd and 6th; scarlet 4th and 5th; white 7th and 8th; the first of each pair having gold, the second silver ornaments.

The Lancers (*Ulanen*) wear the usual lancer uniform of czapka, double-breasted tunic with plastron, and girdle. The trousers are dark grey, the plume white. The girdle is of the uniform colour edged with the facings colour. The cuff is the so-called "Polish," a round, slightly pointed cuff with a button (and where appropriate a guard-stripe) in the middle of the pointed portion. The collar is edged with the uniform colour. Regimental distinctions in the line are as shown in table at the top of next column.

Guard Ulans: dark blue tunic with double guard-stripe and cuff stripes, and dark grey trousers; 1st, red facings, and piping, white turnback (piped red), white czapka; 2nd, scarlet facings and czapka; 3rd, yellow facings and czapka.

17th, 18th and 21st (Saxon), light blue tunics and trousers, crimson facings, double guard-stripes and cuff stripes, brass scales, white piping. Czapkas white, crimson, light blue. Undress caps white. 19th and 20th (Württemberg), dark blue uniforms, dark grey trousers, facings and czapkas scarlet in 19th, yellow in 20th. 19th double guard-stripe and cuff stripe. Ornaments silver. 1st and 2nd Bavarian Ulans, dark green tunics and trousers, crimson facings and czapkas, white belts instead of girdles; 1st gold, 2nd silver ornaments.

* These two regiments have white piping.

The Hussars are very richly dressed, many having the slung pelisse. The front cuffs, back seams and collar are braided. The busby is low and slightly conical, the busby-bag hanging over towards the back on the left side. On the front of the busby are various decorations. Round the waist is a white girdle intertwined with the colours of the state to which the regiment belongs. A plain shoulder cord is worn. The trousers are dark grey with lace stripe. The Hessian boots have embroidered top and boss. The five senior regiments preserve the unusual colours indicative of their irregular origin. The remainder are clothed in dark and light blue, or green. All wear a white (gold or silver officers) pouch-belt, white plumes. The undress cap is of the colour of the tunic, with various bands.

The 17th Brunswick Hussars, preserving the memory of the Black Brunswickers of the Napoleonic wars, have black uniforms (no pelisse), with gold lace and red busby-bag. The 18th and 19th (Saxon) Hussars have light blue tunics and trousers (no pelisse), with gold and silver lace and red and crimson busby-bags respectively. No information is available as to the 20th Hussars, formed in November 1910.

The *Jägers zu Pferd* (mounted rifles) have a green-grey tunic and trousers of cuirassier cut, with green collars, Swedish cuffs, shoulder-straps, and piping, green-grey cap, brown belts and a black helmet of cuirassier pattern. The buttons are silver. The broad cuirassier braid on collar, front and cuffs is green, with white lines in the 1st, red in the 2nd, yellow 3rd, light blue 4th (the normal sequence), black 5th. The edgings of the shoulder-straps are similarly white, red, &c. The "staff orderlies" wear the same uniform, with certain deviations, in particular yellow and green braid, gold buttons, and white undress cap.

The machine gun detachments wear a grey uniform with red Swedish cuffs (guard-stripes and cuff stripes in the Guard corps), collar, shoulder-strap and piping. The head-dress is the Jäger shako, and the whole uniform is of Jäger type, so much so that the 2nd Guard detachment has the black collar and "French" cuff of the *Gardeschützen*.

The field artillery has the dark blue tunic with red piping, black collar and Swedish cuffs, gold appointments, and dark grey trousers without stripe. The helmet has a ball ornament. The cap is blue with black band. The Guard regiments have double guard-stripes and cuff stripes and a white plume—shoulder-straps, white for 1st, red for 2nd, yellow for 3rd, light blue for 4th regiment. In the field artillery at large the shoulder-straps are of the corps colour.

The Bavarian, two Württemberg, one Baden and two Hessian regiments have white or black (Bavarians red) plumes, otherwise as for a "red" Prussian corps. The Mecklenburg artillery has silver buttons. The Saxon field artillery uniform is altogether different, consisting of green tunics with red collars and Swedish cuffs, gold appointments, red edgings, and black plume (horse artillery have a brass scale). Prussian and Bavarian field artillery have white belts, others black.

The foot artillery, which has white shoulder-straps, is distinguished from the field by the black Brandenburg cuff with plain blue flap (Guard Swedish cuff, guard-stripes, &c.) and by a red trouser piping. The Saxon foot artillery is distinguished from the field by the ball ornament instead of plume, and the "German" cuff. Belts black (Guard and Bavarians white). Bavarian foot artillery as Prussian, but with a spiked helmet and black cuff-flap, red-edged.

The pioneers have the same uniform as artillery, but with silver buttons and appointments. The shoulder-straps are red, the helmet is spiked (Guards, black plume). The cuffs are black, red-edged, Swedish. Saxon pioneers as field artillery, but with "German" cuff. The "communication troops" wear similar uniforms with special badges, some having the Jäger shako. The *Train* (army service corps) has dark blue dragoon uniforms with light blue facings and black plumes; Saxons, however, have light blue with black facings. Medical officers and hospital corps wear blue uniforms with blue collars and cuffs and red edgings; stretcher bearers, &c., blue with magenta facings and silver buttons, &c.

Rank Badges (*a*).—Non-commissioned officers: lance-corporal a button on each side of the collar. Corporals and sergeants gold or silver lace on the collar and cuffs, small patches of the national colours on the collar patches of the greatcoat. Sergeants are distinguished from corporals by a button to the collar. There are numerous minor distinctions on the sword knots, lance pennons, hussar girdles, &c. Sergeant-majors have a narrow ring of lace on the cuff in addition to the broad under-officer's ring; and on the greatcoat patch two small national patches. Aspirant officers wear the uniform of their non-commissioned rank with some of the officer's distinctions. (*b*) Officers: The distinctive mark of the commissioned officer is the shoulder-piece (epaulette or cord). The epaulette is almost always silver and is worn as a "scale," *i.e.* without fringe, by captains and subalterns, with a fine fringe by field officers and with a thick fringe by general officers. The ranks within each class are distinguished by small stars on the circle of the epaulette, lieutenant, major, and major-general, no star; first lieutenant, lieutenant-colonel and lieutenant-general, one star; captain, colonel and general, two stars. A colonel-general has three stars and a field-marshal crossed batons. The number or cipher is also worn by all regimental officers. The body of the epaulette is usually of the same colour as the shoulder-strap of the rank and file. The shoulder cord for captains and subalterns is made up of straight strips of silver lace, that for field officers is of twisted silver cords, that of general officers is composed of two gold cords and one of silver and colours intertwined. In all these, lines of the national colours are interwoven with the silver. Badges, numbers, &c., as on the epaulette. A silver waist-sash (staff officers and adjutants shoulder-sash) is worn by all combatant officers (except hussars, who have girdles). An interesting survival of earlier uniforms is found in the full dress of general officers. The tunic buttons below the waist, and while on the left shoulder there is only a narrow silver cord, on the right the thick cord of gold, silver and coloured silks is extended to form an aiguillette. The aiguillette is also worn on the right shoulder by staff officers and some others. A universal custom, which is also a survival, is for all ranks to wear sword-knots, even with the bayonet.

The new service dress is a loose-fitting "field-grey" uniform, except in *Jägers*, machine-gun detachments and *Jägers zu Pferd*, who wear grey-green field dress.

Austria-Hungary

The infantry uniforms, since the abandonment of the historic white after 1866, have been of a very quiet shade of dark blue, and the facings colours are more varied than those of any other army. The "German," that is Austrian, infantry wears in full dress a dark blue single-breasted tunic, light blue trousers, and a black leather shako with double eagle and a metal ball ornament. The equipment is black. On the shoulders are straps terminating in rolls or "wings," all of the regimental colour, as are the collar and the ("German") cuffs. In marching or service dress the tunic is replaced by a hooked jacket or blouse with plain cuffs, no shoulder-straps, and only collar patches of the regimental colour. The trousers are turned up over or tucked into a high ankle boot. The field cap is of cloth, cylindrical, with flaps buttoning in front. Hungarian infantry wears the same tunic but has a silver or white embroidered device in front of the cuff. The trousers are tight pantaloons, with a yellow piping and "Austrian"—really Hungarian—knots. Officers of infantry have no shoulder cords or straps. The full dress shako and the collar are ornamented with braid or lace according to rank. A yellow waist-sash is worn. Hungarian officers are dressed as Austrian except for the tunic cuff ornament. In other respects both the tunic and the blouse are similar to the men's. Jägers wear a broad-brimmed felt hat with cock's feather plume on the left. The tunic, trousers and cap are green-grey; the buttons gold; cuffs, collar, shoulder ornament and piping in full dress, and collar patch and piping in undress, green. Officers wear the waist-sash and double green stripes on the trousers. All officers in undress wear plain dark grey trousers and dark grey cylindrical cloth cap, both in the line and the Jägers.

Dragoons wear light blue jackets with collar and cuffs of regimental colour and narrow white or gold shoulder cord, red trousers, black crested helmets (gilded crests for officers), and slung pelisse exactly similar to the jacket except that the collar and cuffs are of black fur. The jacket is not merely an ornament, but is frequently worn, serving as a tunic. The field cap of the rank and file is red, shaped as for infantry, but without peak. Belts brown. The facings are—dark red 1st and 3rd, black 2nd and 6th, grass green 4th and 9th, imperial yellow 5th and 12th, sulphur yellow 7th and 10th, scarlet 8th and 11th, madder red 13th and 14th, white 15th. Silver buttons 1, 2, 4, 5, 6, 7, 11, 13; gold 3, 8, 9, 10, 14, 15.

Hussars wear dark or light blue jackets and pelisses, the former braided, the latter braided and edged with black fur. The trousers are red with gold "Austrian" knots and piping (all hussars are Hungarian) and the boots have the usual hussar braid. The head-dress is a shako with black "shaving-brush" plume. Regimental distinctions are as follows:—

	Shako.	Silver.	Gold.		Shako.	Silver.	Gold.
Uniform Dk. blue	White	9th	3rd	Uniform Lt. blue	White	12th	2nd
	Dark blue	13th	1st		Light blue	7th	10th
	Madder red	5th	8th		Madder red	4th	14th
	Ash grey	11th	15th		Ash grey	16th	6th

Lancers (*Uhlans*, who do not carry lances) wear the lancer cap (*czapka*) with black plume looped back, and old ornaments, light blue double-breasted lancer tunics (slung on the shoulder as pelisses) with madder red cuffs and piping—but no "plastron"—black for collar and gold shoulder cord. The jacket is plain, light blue, with breast and skirt pockets and flaps edged red, red collar and cuffs, no shoulder cord. The trousers are red. Regimental distinctions—top of the *czapka*, imperial yellow 1st and 6th, dark green 2nd and 7th, madder 3rd and 8th, white 4th, light blue 5th, cherry 11th, dark blue 12th and 13th. Gold buttons 1st, 2nd, 3rd, 4th, 5th and 12th; silver 6th, 7th, 8th, 11th and 13th.

All cavalry officers wear gold or silver pouch-belts; in undress dark grey trousers and cap are worn. Men's undress cap as for dragoons. All cavalry men carry the carbine slung and have brown belts.

Artillery wear maroon tunics, light blue trousers, red collars, cuffs, shoulder-straps and wings, light blue cap, shako with black plume looped back. Fortress artillery have a red stripe in the trousers, technical artillery are dressed as field, but with dark grey trousers and cap and without plume. Buttons gold. On the jacket the whole collar is red. Officers wear pouch-belts as cavalry, and in undress the usual grey trousers and cap.

Engineers have an infantry uniform, but in the Jäger colours, grey and green. Train (A.S.C.) as artillery, but with light blue facings and red trousers with cap. Their shako has no plume.

UNIFORMS.

GERMANY.

PLATE IV

Bavaria: Infantry (III. Corps). Prussia: Infantry (V. Corps). Prussia: 9th Dragoons. Prussia: Captain, Field Artillery. Prussia: Major, 7th Cuirassiers. Prussia: Officer, 3rd Zieten Hussars. Prussia: 14th Uhlans. Prussia: 4th Grenadier Guards. Saxony: Jäger.

GERMANY. ITALY.

Prussia: General. General Staff. Service dress. Bersaglieri: Marching order. Field Artillery Officer. Cavallegieri (12th Regt.). Major-General. Infantry Officer, Undress (Pistoia Brigade). Line Cavalry, Officer Undress (4th Genoa Regt.). Infantry, Service dress (Aosta Brigade).

NAVIES.

England: Marine Light Infantry. France: Sailor. Germany: Marine. Germany: Sailor. Germany: Vice-Admiral. England: Vice-Admiral. England: Sailor. U. S. A.: Sailor.

The staff wears a dark green tunic, short-waisted, double-breasted and piped all round with red. The collar and cuffs are red (cuffs black for general staff), buttons and lace usually gold. The trousers are dark grey, piped red (in some cases with stripes of yellow and red). The general staff wears the waist-sash; the adjutant-general's branch, aides-de-camp, &c., the same sash over the shoulder (as indeed all adjutants wear it in Germany and Austria). The cocked hat is small and has a green feather plume. General officers ordinarily wear dark grey trousers with double red stripe, pearl-grey tunics, cocked hats and waist-sash; their collars and cuffs are red. Inspector-generals of artillery and engineers wear the colours of their arm (brown and Jäger grey). In court dress, however, Austrian generals wear the old white tunic and red, gold-laced trousers; Hungarian generals an elaborate red hussar dress, with a white pelisse.

Rank is shown by stars and lace on the collar. Lance-corporal, corporal and sergeant have 1, 2 and 3 worsted stars; second lieutenant, first lieutenant and captain 1, 2, and 3 gold or silver stars; major, lieutenant-colonel and colonel 1, 2 and 3 stars on a gold-laced collar; major-general, lieutenant field-marshal and general (or *Feldzeugmeister*) 1, 2 or 3 stars on laced collar.

Russia

The figures in Plate III. represent the uniforms of 1905. Since that time the attempt to combine bright colours with the looseness and comfort of service dress has been abandoned, and the troops have received a more handsome full dress and a grey-green field dress. Little information as to the details of the new uniforms has been published. The ordinary infantry uniform was a double-breasted hooked tunic of dark green cloth, dark green trousers and cap (in full dress a round fur cap). With a few exceptions, details of facings, &c., followed well-marked rules. The number of the regiment appeared on the cap, that of the division on the shoulder-strap. The two regiments of the 1st brigade in each division wore red shoulder-straps, the two of the 2nd brigade blue. The 1st regiment had a red cap band and red collar patches, the 2nd blue, the 3rd white and the 4th green. It is not known how far this has been modified of late years. Regiments with royal colonels-in-chief wear ciphers on the shoulder-strap, and some have double guard-stripes on the collar. In winter a heavy grey-brown greatcoat is worn, usually with a loose sheepskin lining and a fur-lined hood. The grenadiers are distinguished by yellow shoulder-straps (with a narrow edging of red, blue, white and yellow, according to the division). The Guards wear closely fitting tunics, with guard-stripes on the collars and cuff-flaps. In the 1st Guard division the shoulder-straps and piping are red and white, in the 2nd red and red, in the 3rd yellow and yellow respectively. The cuff-flaps are red in 1st, and 2nd, yellow in 3rd division. The colour of the collars and cuffs varies according to the order of regiment within the division. The Pavlovsky regiment wears, instead of the fur cap, the old mitre-cap in brass and stiff red cloth.

Rifles wear the universal pattern uniform with plain cap-band and collar and crimson shoulder-straps. The Finland rifles have light blue instead of crimson, and the Guard rifles have double guard-stripes and stripes on the cuff-flap (or Swedish cuff).

Line dragoons wear a dark green silver or gold buttoned tunic, double-breasted, grey-blue trousers and knee boots. The cap, which was peaked, and had a dark green band, was, in 1905, red for the 1st, blue for the 2nd, and white for the 3rd regiment of each division, the same colours appearing on the collar patches, piping and shoulder-straps. The regimental number (or colonel-in-chief's cipher) appears on the shoulder-strap. The fur cap is in shape a truncated cone, the body of the cap being of the colour of the facings and the sides of fur. A few regiments had special distinctions.

The cuirassiers (guards) wear in full dress white cuirassier uniforms with brass helmets and eagles, and in field order dark green tunics and white caps. The trousers are grey-blue with red stripe. The Horse Grenadiers wear dark green lancer tunic with red facings, double guard-stripe and cuff-stripe, red girdles and dark grey trousers with red stripes. They wear epaulettes and the curious grenadier cap mentioned above. The Guard Dragoons are dressed as the Horse Grenadiers, but with the dragoon busby and red shoulder-straps. The Guard Lancers wear a lancer uniform resembling the German, blue with scarlet facings, lancer caps and grey-blue trousers. The top of the czapka is scarlet and yellow for the respective regiments. The Emperor's Hussars wear scarlet tunics and blue trousers, and the Grodno Hussars dark green tunics and crimson trousers (see Plate III., line 2, No. 7), with busby, red busby-bag and white plume; girdles scarlet and blue and green and white, and braid yellow and white respectively.

The artillery tunic, trousers and cap are dark green, the piping and shoulder-strap red. The Guard Artillery has black collar and cuffs, red-edged. The engineers are distinguished from artillery by their having silver buttons and appointments instead of gold.

The greater part of the Cossacks wear a long, loose caftan. This, in the Don, Ural and Astrakhan contingents is dark blue, in the rest, except as mentioned below, dark green. Cossacks wear no spurs, but use a whip. As for the facings, the Don regiments have plain, and the other blue regiments crimson and yellow shoulder-straps respectively, and the green regiments have red, yellow or light blue. The head-dress is a conical lambskin cap, with cloth top, or a blue or green cap with band of the regimental colour. The Caucasus regiments, however, wear a more distinctly national uniform, consisting of a dark brown, collarless caftan, cut away below the throat to show a waistcoat, scarlet for Kuban and blue for Terek regiments (Plate III., line 2, No. 6). The shoulder-straps are of the colour of this waistcoat. The Caucasus regiments always wear the full head-dress and never the field cap. The Guard Cossacks have short tunics (scarlet, light blue and dark red) with guard-stripes on collar and cuffs, and caps of the same colours. These wear spurs besides carrying whips. The Cossacks of the tsar's escort wear a scarlet caftan edged with gold braid, white waistcoat and dark blue trousers. The Cossack artillery wears green uniforms of Cossack cut, with red facings.

Badges of rank are as follows: Non-commissioned officers, one, two or three stripes of braid across the shoulder-strap; sergeant-major, a stripe of gold lace across the shoulder-strap. In and above the rank of corporal, gold lace is worn on the collar and cuffs as in Germany. Officers wear broadcloth (red, blue, &c.) shoulder-straps nearly covered by strips of silver or gold lace; on these appear the number or cipher and stars of rank—subalterns one, two and three, second captains four and senior captains none. In these ranks the cloth of the shoulder-strap shows in one narrow strip through the lace. In the field ranks, the cloth, covered by three bars of lace, shows two strips and the same sequence is followed: lieutenant-colonel, three stars; colonel, none. In general officers' uniforms the lace entirely covers the cloth, and the stars number two for a major-general, three for lieutenant-general and none for a full general.

Italy

The universal colour in full dress and undress coats is a dark, flat blue, faintly tinged with purple. Generals, cavalry and infantry (except *Bersaglieri*) wear blue-grey trousers and silver ornaments; staff officers, artillery and engineers dark blue trousers and gold ornaments.

The coat, whether tunic or frock, has a stand and fall collar, on the corners of which invariably figures a five-pointed silver or white star. The cuffs are slightly pointed, except for cavalry. The full-dress head-dress is a low cloth shako, the undress throughout a képi. Generals wear only the képi. The tunic, double-breasted for officers and single-breasted for rank and file, is cut very short, and has little piping. Officers have plain blue shoulder-straps with stars showing rank. A white collar is worn under the coat collar by all ranks. Officers have a blue frock, with black braid and plain cuffs.

Infantry have silver buttons and (rank and file) red-edged shoulder-straps and shoulder wings, blue-grey trousers with red piping (officers, double stripe). The shako is blue with red piping (officers, silver braid), silver device and cockade; the képi (in the rank and file pointed back and front and pressed down at the sides) is similar in colour, &c., to the men's shako. The belts are black. The Grenadier brigade alone has red collars and cuffs, all others are self-coloured (red edge to cuff). The greatcoat is light blue-grey, single-breasted and unadorned except for shoulder wings. White or holland gaiters are worn with the blue uniform. The brigades are distinguished by gorget patches of the brigade colours, upon which the star is worn. Officers wear a shoulder sash of light blue, and in full dress silver epaulettes.

Cavalry.—Line cavalry have light coloured collars, cuffs and shoulder-strap edges, silver buttons, and blue-grey trousers with double back stripe (officers, of the facings colour). Regimental distinctions are given in the table. The full head-dress is a singularly handsome helmet, partly black, partly bright steel, with a tall swan-neck crest (see Plate IV., lines 1, 2, fig. 8) and on the front a broad white cross. The undress cap is a képi with piping as in table. On the men's shoulder-straps is a silver grenade. The lancers (*Lanzieri*) have coat and trousers as line cavalry with regimental distinctions given below. On the men's shoulder-straps are crossed lances. The head-dress is a fur cap, adorned with crossed lances and chain in silver. It has also a cockade and a small upright plume. The crossed lances appear also on the képi. The light horse (*Cavallegieri*) have a similar coat and trousers, except that the collar has a flame-shaped patch. Shoulder-strap, full head-dress and képi as for lancers, with a bugle instead of lances. All cavalry have brown bandoliers over the left shoulder.

Artillery, gold buttons, dark blue trousers, with yellow piping (officers, double yellow stripe). Officers' tunics have black yellow-edged collars and cuffs, men's a black yellow-edged collar patch, and yellow edgings on the collars, shoulder-straps and cuff. The badge of the field artillery on shako, képi and men's shoulder-straps is gold crossed guns; that of the horse and mountain, a gold grenade; fortress artillery are dressed practically as field. The shako has gold badge and short upright plume (horse artillery long black plume, looped back on the right side); the képi piping is yellow. Gold epaulettes and light blue sash are worn by officers, and in the horse artillery a pouch-belt as well. *Engineers* have the artillery uniform, but with red piping, &c. instead of yellow, and badge of crossed axes. The departmental corps wear, as a rule, black facings with light blue piping, differing amongst themselves in details.

The famous *Bersaglieri* (light infantry) have the infantry tunic and frock with gold buttons, &c. (officers in full dress, epaulettes), dark blue trousers with crimson stripe. Officers have crimson cuffs, all ranks a blue red-edged collar, with crimson flame patch. The distinctive feature is the dark, wide-brimmed, slouch hat with a large drooping cock's feather plume. The Alpine infantry (*Alpini*) have a black felt hat with silver device and eagle feather, tunic, trousers and képi with green instead of red piping throughout. Officers wear black collar with green flame patch and green cuffs.

General officers have a single-breasted tunic with black velvet collar and cuffs laced with silver, red piping, silver shoulder-straps, and silver buttons. Frock, trousers, &c., as shown on Plate IV., line 2, No. 5. Staff officers wear light blue collar and cuffs, dark blue trousers with gold stripe and shako somewhat as for artillery officers. They wear the usual light blue shoulder sash, but over the left, instead of, as in the army at large, over the right shoulder.

The new service dress is blue-grey, regimental distinctions as on the officer's frock and képi in all arms. Infantry equipment is shown on Plate IV., line 2, No. 9. The cavalry head-dress is a round grey helmet.

Rank Badges.—Non-commissioned officers: Red or silver chevrons above the cuff, and small distinctions on the shako. Officers: On the shoulder-strap, 1, 2 and 3 silver stars for subalterns and captains, the same with narrow silver edging round the strap for field officers, 1, 2 or 3 gold stars on a silver shoulder-strap for general officers; on the shako, silver or gold rings round the upper part, on the képi rings round the lower part of the cap, 1, 2 or 3 for company officers, 1 broader ring and 1, 2 or 3 for field officers. On the general's képi there is a red, silver-embroidered band with 1, 2 or 3 rings above.

United States

The uniforms, though recent changes have largely deprived them of their character, still in some respects follow the French fashion upon which they were originally modelled. The helmet, worn until 1899, indeed showed no trace of French influence—it was simply a mere showy parade head-dress. The French képi, worn during and after the Civil War, has been abolished and replaced by a cap which, like the full-dress cap now worn, bears some resemblance to the Japanese cap. But the long-skirted blue tunic, the general's "chapeau," the sergeant's and corporal's long pointed chevrons still survive to recall the old uniforms, and one or two of the innovations, the rank badges on the sleeve, are also French.

Infantry Officers.—Full dress: universal pattern tunic (dark blue, double-breasted with thick gold shoulder cord) with light blue, gold-laced collar, light blue trousers with white stripe, badges of rank and branch on sleeve. Universal pattern full-dress peaked cap (stiff blue cloth, gold-edged band, and eagle badge, with light blue band). Undress: universal pattern frock (dark blue, single-breasted, braided black and hooked; across the shoulder, flat loops edged with gold lace and bearing rank badges); shoulder loop light blue; plain collar with U.S. and branch badge in gold; trousers as in full dress. Sword belt under the frock, slings brown leather. Cap, of the same shape as full-dress cap but with plain black braid band. A white undress of similar pattern is worn in hot climates. Service dress (olive drab or light khaki). Coat, single-breasted, four pockets, stand and fall collar, bronze buttons and ornaments. Brown waistbelt and braces, somewhat similar to British "Sam Browne," but with sword slings. Peaked cap, plain olive drab or khaki, with bronze eagle badge. Slouch hat, grey, with gold and black twisted cord.

Evening dress and mess dress: blue, with shoulder cords and rank-marks as in full dress, blue trousers. Greatcoat, universal pattern, khaki with horn buttons; rank-marks in black braid on the sleeve, branch badge in bronze.

Cavalry officers as infantry, but with yellow collar, cap-band and trousers stripes as full dress and branch badge.

Artillery officers as infantry, but with red collar, cap-band and trousers stripes, and branch badge.

Engineer officers as infantry, but branch badge, red ground with white edges on full-dress collar and cap. Full-dress trousers, dark blue with red, white-edged stripe; undress, light blue with red stripe. In full dress engineer officers have the special distinction of wearing red skirt-flaps with white line and gold edge. *Signal Corps*, as infantry, but with branch badge and salmon collar, cap-band, &c. Signal officers, alone in the army, wear a pouch-belt: this is of black leather—crimson leather for the chief of the corps—with gold appointments. *Ordnance Corps*, as infantry, but dark blue red-edged trousers stripes, &c., and branch badge. *Medical*, as infantry, but with magenta stripes, &c., and branch badge.

Generals and Staff Officers.—Major-generals (and with a third star lieutenant-generals), dark blue double-breasted tunic with buttons in threes, and cuffs and collar of black velvet ornamented with oak-leaf gold embroidery, above the cuffs two silver stars; gold epaulettes and aiguillette, wide yellow waist-sash; dark blue trousers with two gold stripes: slings, and waist-belt if worn, crimson leather with gold stripes. "Chapeau" or cocked hat (French pattern) black felt with black feather edging and gold ornament; full-dress cap, universal pattern, with black velvet band, embroidered on band and peak as on full-dress cuffs. Undress: blue frock, double-breasted, with buttons in threes, "stand and fall" collar with U.S. in gold; rank marks on shoulder loops; plain dark blue trousers, universal pattern undress caps with oak-leaves on the peak only. White undress uniform is similar. Brigadier-generals, as major-generals with the following distinctions: one star on the sleeve or shoulder-loop, narrow yellow sash, buttons in pairs, plain black strap instead of crimson waist-belt (with, however, crimson and gold slings). Service dress and overcoats (all general officers) universal pattern: on the slouch hat a gold cord instead of black and gold. Evening and mess dress, universal pattern, with cuffs, collar and epaulettes as in full dress. Certain general officers who are chiefs of departments wear some of the distinctions of their branch; thus the adjutant-general, the quartermaster-general, &c., wear the branch badge below the stars, the chief of engineers the scarlet engineer skirt flap, the chief of artillery a crimson waist-sash instead of yellow. In undress these officers have a ground of their branch colour instead of dark blue on the shoulder loops. *Staff officers* are in the main uniformed in the same way as those of infantry, but wear dark blue trousers (in full dress a gold stripe), black and gold belts and slings, branch badge on sleeve, and full-dress collars, full-dress cap-bands and undress shoulder loops of the branch colour.

Branch and Line Badges.—General staff, a silver star, decorated with eagle device; inspector-general's department, sword and "fasces" crossed in wreath, gold; adjutant-general's department, gold shield with U.S. arms; quartermaster-general's department, sword and key crossed, surmounted by eagle, over a wheel, gold; ordnance, grenade; commissary or subsistence, silver crescent; infantry, gold crossed rifles; cavalry, gold crossed swords; artillery, gold crossed guns; engineers, silver castle; signal corps, crossed flags and torch; medical, winged Aesculapius staff. Aides-de-camp wear a shield like the adjutant-general's but in red, white and blue enamel and surmounted by an eagle; adjutants, quartermasters, commissaries, &c., of the combatant arms wear a shield, sword and key, crescent, &c., under the guns, swords, &c., of the regiment or corps.

Branch and Arm Colours.—Infantry, light blue; cavalry, yellow; artillery, red; engineers, red with white edge; signal corps, salmon with white edge; quartermaster's department, yellow ochre; ordnance, blue with crimson edge; other staffs and departments, light blue; medical, magenta; general staff, dark blue.

Badges of Rank.—Officers: general, lieutenant-general, major-general, brigadier-general, stars 4, 3, 2, and 1 respectively, in all orders of dress. Other officers, in undress, silver on a shoulder loop of coloured cloth according to branch; colonel, spread eagle; lieutenant-colonel, pair of oak-leaf sprigs; major as lieutenant-colonel but in gold; captain, two pairs of bars; 1st lieutenant, one pair of bars; 2nd lieutenant, no badge: in full dress, evening dress and greatcoat, colonel fivefold, lieutenant-colonel fourfold, major threefold, captain twofold, 1st lieutenant single Austrian knot of narrow gold braid, 2nd lieutenant no Austrian knot. Field officers have black leather waist-belt and slings completely covered with gold braid, and also oak-leaf embroidery on the peak of the full-dress cap. Captains and lieutenants have similar belts, but with four gold braids only; in the infantry, cavalry, artillery and engineers the intervening spaces ("lights") are coloured light blue, yellow, &c., while in other cases the black leather is allowed to appear.

Enlisted men are dressed similarly to officers, with the following differences: tunic with dark blue cuffs, collar and shoulder-straps. The collar is edged top and bottom, the shoulder-straps all round and the cuffs along the top edge wth yellow for cavalry, light blue for infantry, &c. The badge of the branch in brass is on the collar. Lines are worn (aiguillette fashion) as an additional decoration; these are of the branch colours. The trousers are light blue, with, in full dress, stripes of branch colours. The white undress, service dress and greatcoat are similar to those for officers, with certain distinctions in detail. The full-dress cap is of the officers' pattern, but the band is dark blue, edged with the branch or arm colour above and below, and the badge is brass in a white metal wreath. The slouch hat has a cord of the branch colours. Rank marks of non-commissioned officers are long, graceful chevrons (inherited from France) pointing upwards, 1, 2 and 3 for lance-corporals, corporals and sergeants, 3 with diamond star, &c., for "first sergeants" and corresponding ranks, 3 with the lower ends connected by bars or arcs of the chevron material for sergeant-majors and staff-sergeants. In full dress these chevrons are of the colour of the branch facings, in service dress of khaki embroidery.

Naval Uniforms.—The full-dress coat of British naval officers is a dark blue double-breasted swallow-tailed coat with gold buttons, lace and epaulettes, a white gold-edged slashed-flap on the sleeve with rings of lace showing rank. Dark blue trousers with gold stripes, and black silk cocked hat. The undress coats are frock coat, which may be worn with epaulettes, and double-breasted jumper, both having plain cuffs with rings of gold lace. The undress cap is a peaked cap with gold badge. Certain petty officers wear blue jumpers, the rest and the sailors wear sailors' dress (Plate IV., line 3, No. 7). White is worn in the tropics, with white pith helmets in the case of officers and broad-brimmed straw hats in that of the sailors. Royal Marine Artillery and Royal Marine Light Infantry are dressed as artillery and infantry of the army, with certain distinctions; they may always be recognized by the badge of a globe within a laurel wreath. (Plate IV., line 3, No. 1.)

Officers' Rank Marks.—(*a*) On the epaulette: Batons in laurel wreath and crown, admiral of the fleet; crown, sword and baton crossed, and 1, 2, 3 stars, rear-admiral, vice-admiral, admiral; anchor and crown, with 0, 1, 2, stars, commander, junior captain, senior captain; anchor and star, senior lieutenant; anchor, junior lieutenant; anchor on fringeless epaulette, sub-lieutenant. (*b*) On the sleeve (in all orders of dress except white, and greatcoat): flag officers, broad gold ring with 1, 2, 3, 4 narrow rings (the uppermost with a curl) for rear-admiral, vice-admiral, &c.; other officers, 1, 2, 2 with narrower ring between, 3 and 4 for sub-lieutenant, junior lieutenant, senior lieutenant, commander and captain. (*c*) Shoulder straps in greatcoat and white undress, blue strap with bars and curl as on sleeve in other orders, except flag officers, who have gold-laced shoulder-strap with rank marks as on epaulette. Non-combatant branches have not the "curl," and between the gold bars or rings there are "lights" or stripes of various colours according to branch. The Royal Naval Reserve officers have similar rank mark, but, instead of bars of plain lace, a thin twist of gold embroidery, and an oval badge surrounding the anchor on the epaulettes.

The uniforms of other navies are very similar to those of the British. The old-fashioned jacket worn over the sailor blouse, and the conspicuous white lapels of the full-dress coat, are the principal peculiarities of the German navy. The Spanish naval officer has red lapels. A very marked peculiarity of the Austrian navy is that the officers, dressed in all other respects similarly to the naval officers of other countries, have the military tunic. The marines, where they exist, conform to the infantry of the respective land forces in most respects; the German marines, however, wear the Jäger shako, and navy-blue uniforms with white collars and cuffs. (Plate IV., line 3, No. 3.)

See Colonel C. Walton, *British Army*; and British regimental histories; Ottenfeld and Teuber, *Oesterreichs Armee*; Richard Knötel, *Uniformen-Kunde*; R. Nevill, *British Military Prints*; Lienhardt and Humbert, *Les Uniformes de l'Armée Française*; British Dress Regulations, 1822, 1834, 1846, 1855–64, 1874, 1883, 1891 and 1904; Lavisse, *Sac au Dos*, and Moritz Ruhl's handbooks of the German, Austrian, Russian, Italian and French army uniforms of the present day. The particulars given of the United States army uniforms have been obtained, by the kind permission of the United States Embassy, from official plates. (C. F. A.)

UNION (known locally as Union Hill and officially as Town of Union), a town of Hudson county, New Jersey, U.S.A., on the Hudson river, adjoining West Hoboken and Weehawken, and opposite New York City. Pop. (1900), 15,187, of whom 5179 were foreign-born; (1910 U.S. census) 21,023. In the foreign element Germans predominate. The town is served by the railways passing through Weehawken and Hoboken. The principal manufactures are silk goods, shirts and malt liquors. In 1905 the factory products were valued at $3,512,451. Originally a part of the township of North Bergen, Union was incorporated as a separated township in 1861, and as a town, under the name Town of Union, in 1864.

Town of Union must not be confused with Union township (pop. in 1910, 3419), Union county, incorporated in 1808; Union township (1910, 2756), Bergen county, incorporated in 1852; Union township (1910, 982), Ocean county, incorporated in 1846; and Union township (1910, 930), Hunterdon county, incorporated in 1853. Union township, Camden county, became Gloucester City in 1868, and Union township, Hudson county, became West New York in 1898.

UNION, a town and the county-seat of Union county, South Carolina, U.S.A., about 66 m. N.W. of Columbia. Pop. (1900) 5400, of whom 1701 were negroes; (U.S. census 1910) 5623. Union is served by the Southern and the Union & Glenn Springs railways; the latter connects at Pride, 16 m. distant, with the Seaboard Air Line. The city is situated in the Piedmont region near the foot of the Blue Ridge Mountains. It is the seat of Clifford Seminary for Young Women (opened, 1881; chartered, 1883), and has a Carnegie library. Union is in a rich cotton-growing, farming and fruit-growing region, and deposits of gold, magnetic iron ore, marble and granite are found. The town has several large cotton mills and a large knitting mill. Union was settled about 1755 and was incorporated as a town in 1872.

UNION LEAGUE OF AMERICA, THE, sometimes called the Loyal League, an organization for political purposes of Northern whites, later of Southern blacks, which originated in Ohio in 1862 when the Confederate military successes and political disaffection in the Northern states made the outlook for the North seem doubtful. Within one year it had spread over eighteen Northern states and among the Unionists of the South. The order raised troops, paid their expenses, sent supplies to the field and distributed political literature. At the close of the war it worked for radical reconstruction of the Southern states, punishment of the Southern leaders, confiscation of property and negro suffrage. The Southern Unionists hoped to make it the nucleus of a new political party, but this was frustrated by the admission of the blacks for political purposes, after which the Southern whites generally deserted the League. After the Freedmen's Bureau agents and other Northern whites obtained command of the League in the South it became simply a machine to control the votes of the blacks. The League ceased to be important in the North, though headquarters were in New York City. Each Southern state had its grand council and each county one or more councils. A constitution and an elaborate ritual were adopted, making it an oath-bound secret order, whose members were sworn to support one another on all occasions, to vote in elections only for negroes or Northern men, and to overthrow the Southern "white oligarchy." No ex-Confederate and few Southern Unionists were permitted to join. At each meeting the members were taught from a catechism prepared by Radical members of Congress that they must beware of their white neighbours as their worst enemies, that the Democratic party, to which the Southern whites belonged, had opposed emancipation and was still opposed to any rights for the negro. In order to prevent moral control of the negroes by former masters, the League, by an "exodus order," required all negroes who were still living with their former masters to find other homes. The negroes were taught the equality of men and the right of the negro to his master's property. The votes of blacks, during reconstruction, were controlled by the few white Radical leaders. No negro could safely break away and vote independently. Negroes who voted with the mass of the Southern whites were persecuted, beaten or (as in a few cases) killed. The League died out about 1870, but not before it had succeeded, with the Freedmen's Bureau and other forces, in permanently arraying the blacks and whites into opposing political parties. (W. L. F.)

UNIONTOWN, a borough and the county-seat of Fayette county, Pennsylvania, U.S.A., about 40 m. S. by E. of Pittsburg. Pop. (1900) 7344 (449 foreign-born); (1910) 13,344. Uniontown is served by the Pennsylvania and the Baltimore & Ohio railways. Coal, iron and natural gas are found in the neighbouring region. The manufactures include glass products, iron, steel, enamel, radiators, coke, flour and bricks.

The original village was surveyed and laid out in 1776 on land owned by Henry Beeson, and the borough was incorporated in 1796. From 1827 to 1832 Uniontown was the seat of Madison College, formed from Union Academy (founded 1808); in 1832 the college was merged with Allegheny College, of Meadville, Pa. In 1866 the buildings were turned over to the Soldiers' Orphans' School (now at Jumonville, a suburb), which occupied them until 1875. In the south-eastern part of the county is the district known as Great Meadows; here George Washington built Fort Necessity in 1754, and General Edward Braddock died and was buried here after his defeat by the French and Indians in 1755.

UNITARIANISM, a system of Christian thought and religious observance, based, as opposed to orthodox Trinitarianism, on the unipersonality of the Godhead, *i.e.* that the Godhead exists in the person of the Father alone. Unitarians carry their history up to the Apostolic age, claim for their doctrine a prevalence during the ante-Nicene period, and by help of Arian communities and individual thinkers trace a continuity of their views to the present time. However this may be, it is certain that the Reformation of the 16th century was in every European country attended by an outbreak more or less serious of anti-Trinitarian opinion. Suppressed as a rule in individual cases, this type of doctrine ultimately became the badge of separate religious communities, in Poland (extinct), in Hungary (still flourishing), and at a much later date in England. Along with the fundamental doctrine, certain characteristics have always marked its professors; namely, a large degree of toleration, a minimizing of essentials, a repugnance to formulated creed, an historical study of Scripture. Martin Cellarius (1499–1564) a friend of Luther, is usually regarded as the first literary pioneer (1527) of the movement; the anti-Trinitarian position of Ludwig Haetzer (*q.v.*) was not disclosed till after his execution (1529) for anabaptism. Both by his writings (from 1531) and by his fate (1553) Servetus (*q.v.*) stimulated thought in this direction. The *Dialogues* (1563) of Bernardino Ochino, while defending the Trinity, stated objections and difficulties with a force which captivated many. In his 27th Dialogue Ochino points to Hungary as a possible home of religious liberty. It was in Poland and Hungary that religious communities, definitely anti-Trinitarian, were first formed and tolerated.

Poland.—Scattered expressions of anti-Trinitarian opinion appear here early. At the age of 80, Catherine, wife of Melchior Vogel or Weygel, was burned at Cracow (1539) for apostasy; whether her views embraced more than deism is not clear. The first synod of the Reformed Church was held in 1555; at the second (1556), Gregory Pauli and Peter Gonesius avowed anti-Trinitarian and anabaptist views. The arrival of Blandrata (*q.v.*) in 1558 furnished the party with a leader. In 1565 the diet of Piotrkow excluded anti-Trinitarians from the existing synod; henceforward they held their own synods as the Minor Church. Known by various other names (of which Arian was the most common), at no time in its history did this body adopt for itself any designation save Christian. Originally Arian (though excluding any worship of Christ) and anabaptist, the Minor Church was (by 1588) brought round to his own views by Fausto Sozzini, who had settled in Poland in 1579 (see Socinus). In 1602 James Sienynski established at Raków a college and a printing-press, from which the *Racovian Catechism* was issued in 1605. In 1610 a Catholic reaction began, led by Jesuits. The establishment at Raków was suppressed in 1638, two lads having pelted a crucifix outside the town. Twenty years later the Polish Diet gave anti-Trinitarians the option of conformity or exile. The Minor Church included many Polish magnates, but their adoption of the views of Sozzini, which precluded Christians from magisterial office, rendered them politically powerless. The execution of the decree, hastened by a year, took place in 1660. Some conformed; a large number made their way to Holland (where the Remonstrants admitted them to membership on the basis of the Apostles' Creed); others to the German frontier; a contingent settled in Transylvania, not joining the Unitarian Church, but maintaining a distinct organization at Kolozsvár till 1793. At Amsterdam was published (1665–1669) the *Bibliotheca fratrum polonorum*, embracing the works of Hans Krell, their leading theologian, of Jonas Schlichting, their chief commentator, of Sozzini and of Johann Ludwig Wolzogen; the title-page of this collection, bearing the words *quos Unitarios vocant*, introduced this term to Western Europe.

Transylvania and Hungary.—No distinct trace of anti-Trinitarian opinion precedes the appearance of Blandrata at the Transylvanian court in 1563. His influence was exerted on Francis Dávid (1510–1579), who was successively Catholic, Lutheran, Calvinist and anti-Trinitarian. In 1564 Dávid was elected by the Calvinists as "bishop of the Hungarian churches in Transylvania," and appointed court preacher to John Sigismund, prince of Transylvania. His discussion of the Trinity began (1565) with doubts of the personality of the Holy Ghost. His antagonist in public disputations was the Calvinist leader, Peter Juhász (Melius); his supporter was Blandrata. John Sigismund, adopting his court-preacher's views, issued (1568) an edict of religious liberty at the Torda Diet, which allowed Dávid (retaining his existing title) to transfer his episcopate from the Calvinists to the anti-Trinitarians, Kolozsvár being evacuated by all but his followers. In 1571, John Sigismund was succeeded by Stephen Báthory, a Catholic, and trouble began. Under the influence of John Sommer, rector of the Kolozsvár gymnasium, Dávid (about 1572) abandoned the worship of Christ. The attempted accommodation by Sozzini only precipitated matters; tried as an innovator, Dávid died in prison at Déva (1579). The cultus of Christ became an established usage of the Church; it is recognized in the 1837 edition of the official hymnal, but removed in the edition of 1865. On the other hand, in 1621 a new sect arose, the *Sabbatarii*, with strong Judaic tendencies; though excluded from toleration they maintained an existence till 1848. The term *unitarius* (said to have been introduced by Melius, in discussions of 1569–1571) makes its first documentary appearance in a decree of the Lécsfalva Diet (1600); it was not officially adopted by the Church till 1638. Of the line of twenty-three bishops the most distinguished were George Enyedi (1592–1597), whose *Explicationes* obtained European vogue, and Michael Lombard Szentabrahámi (1737–1758), who rallied the forces of his Church, broken by persecution and deprivation of property, and gave them their existing constitution. His *Summa universae theologiae secundum Unitarios* (1787), Socinian with Arminian modifications, was accepted by Joseph II. as the official manifesto of doctrine, and so remains, though no subscription to it has ever been required. The official title is the Hungarian Unitarian Church, with a membership of over 60,000, most of them in Transylvania, especially among the Szekler population, a few in Hungary; their bishop has a seat in the Hungarian parliament. At Kolozsvár, the seat of the consistory, is the principal college; others are at Torda and at Székely-Keresztúr. Till 1818 the continued existence of this body was unknown to English Unitarians; relations have since become intimate; since 1860 a succession of students have finished their theological education at Manchester College, Oxford; others at the Unitarian Home Missionary College.

England.—Between 1548 (John Assheton) and 1612 we have a thin line of anti-Trinitarians, either executed or saved by recantation. Those burned were George van Parris (1551), Flemish surgeon; Patrick Pakingham (1555), fellmonger; Matthew Hamont (1579), ploughwright; John Lewes (1583); Peter Cole (1587), tanner; Francis Kett (1589), physician and author; Bartholomew Legate (1612), cloth-dealer, last of the Smithfield victims; and the twice-burned fanatic Edward Wightman (1612). In all these cases the virus seems to have come from Holland; the last two executions followed the rash dedication to James I. of the Latin version of the *Racovian Catechism* (1609). The vogue of Socinian views, which for a time affected men like Falkland and Chillingworth, led to the abortive fourth canon of 1640 against Socinian books. The ordinance of 1648 made denial of the Trinity capital, but it was a dead letter, Cromwell intervening in the cases of Paul Best (1590–1657) and John Biddle (1616–1662). In 1650 John Knowles was an Arian lay-preacher at Chester. In 1652–1654 and 1658–1662 Biddle held a Socinian conventicle in London; in addition to his own writings he reprinted (1651) and translated (1652) the *Racovian Catechism*, and the *Life of Socinus* (1653). His disciple Thomas Firmin (1632–1697), mercer and philanthropist, and friend of Tillotson, was weaned to Sabellian views by Stephen Nye (1648–1719), a clergyman. Firmin promoted a remarkable series of controversial tracts (1690–1699).

The term "Unitarian" first emerges in 1682, and appears in the title of the *Brief History* (1687). It was construed in a broad sense to cover all who, with whatever differences, held the unipersonality of the Divine Being. Firmin had later a project of Unitarian societies "within the Church"; the first preacher to describe himself as Unitarian was Thomas Emlyn (1663–1741) who gathered a London congregation in 1705. This was contrary to the Toleration Act of 1689, which excluded all who should preach or write against the Trinity. It is noteworthy that in England the Socinian controversy, initiated by Biddle, preceded the Arian controversy initiated by Samuel Clarke's *Scripture Doctrine* of the Trinity (1712). Arian or semi-Arian views had much vogue during the 18th century, both in the Church and in dissent. The free atmosphere of dissenting academies (colleges) favoured new ideas. The effect of the Salters' Hall conference (1719), called for by the alleged heresy of James Peirce (1673–1726) of Exeter, was to leave dissenting congregations to determine their own orthodoxy; the General Baptists had already (1700) condoned defections from the common doctrine. In 1689 Presbyterians and Independents had coalesced, agreeing to drop both names and to support a common fund. The union in the London fund was ruptured in 1693; in course of time differences in the administration of the two funds led to the attaching of the Presbyterian name to theological liberals, though many of the older Unitarian chapels were Independent foundations, and at least half of the Presbyterian chapels (of 1690–1710) are now in the hands of Congregationalists. Leaders in the advocacy of a purely humanitarian christology came largely from the Independents, *e.g.* Nathaniel Lardner (1684–1768), Caleb Fleming (1698–1779), Joseph Priestley (1733–1804), Thomas Belsham (1750–1829).

The formation of a distinct Unitarian denomination dates from the secession (1773) of Theophilus Lindsey (1723–1808) from the Anglican Church, on the failure of the Feathers petition to parliament (1772) for relief from subscription. Lindsey's secession had been preceded in Ireland by that of William Robertson, D. D. (1705–1783), who has been called "the father of Unitarian nonconformity." It was followed by other clerical secessions, mostly of men who left the ministry, and Lindsey's hope of a Unitarian movement from the Anglican Church was disappointed. By degrees his type of theology superseded Arianism in a considerable number of dissenting congregations. The Toleration Act was amended (1779) by substituting belief in Scripture for belief in the Anglican (doctrinal) articles; in 1813 the penal acts against deniers of the Trinity were repealed. In 1825 the British and Foreign Unitarian Association was formed as an amalgamation of three older societies, for literature (1791), mission work (1806) and civil rights (1818). Attacks were made on properties held by Unitarians, but created prior to 1813. The Wolverhampton Chapel case began in 1817, the more important Hewley Fund case in 1830; both were decided against the Unitarians in 1842. Appeal to parliament resulted in the Dissenters' Chapels Act (1844), which secures that, so far as trusts do not specify doctrines, twenty-five years tenure legitimates existing usage.

The drier Priestley-Belsham type of Unitarianism, bound up with a determinist philosophy, was gradually modified by the influence of Channing (see below), whose works were reprinted in numerous editions and owed a wide circulation to the efforts of Robert Spears (1825–1899). Another American influence, potent in reducing the rigid though limited supernaturalism of Belsham and his successors, was that of Theodore Parker (1810–1860). At home the teaching of James Martineau (1805–1900), resisted at first, was at length powerfully felt, seconded as it was by the influence of John James Tayler (1797–1869) and John Hamilton Thom (1808–1894). The body has produced some remarkable scholars, *e.g.* John Kenrick (1788–1877), James Yates (1789–1871), Samuel Sharpe (1799–1881), but few very popular preachers, though George Harris (1794—1859) is an exception. Its year-book specifies 406 congregations in England and Wales. For the education of its ministry it supports Manchester College at Oxford (which deduces its ancestry from the academy of Richard Frankland, begun 1670), the Unitarian Home Missionary College (founded in Manchester in 1854 by John Relly Beard, D.D., and William Gaskell), and the Presbyterian College, Carmarthen.

English Unitarian periodical literature begins with Priestley's *Theological Repository* (1769–1788), and includes the *Monthly Repository* (1806–1838), The *Christian Reformer* (1834–1863), the *Prospective Review* (1845–1854), the *National Review* (1855–1864), the *Theological Review* (1864–1879), and now the *Hibbert Journal*, one of the enterprises of the Hibbert Trust, founded by Robert Hibbert (1770–1849) and originally designated the Anti-Trinitarian Fund. This came into operation in 1853, awards scholarships and fellowships, supported (1878–1894) an annual lectureship, and has maintained (from 1894) a chair of ecclesiastical history at Manchester College. The general activities of the body are conducted partly by its association (Essex Street, Strand), partly by its (triennial) National Conference, established 1882. It has two weekly papers, the *Inquirer* and the *Christian Life*.

Scotland.—Much has been made of the execution (1697) at Edinburgh of the student Thomas Aikenhead, convicted of blaspheming the Trinity. The works of John Taylor, D.D. (1694–1761) on original sin and atonement had much influence in the east of Scotland, as we learn from Robert Burns; and such men as William Dalrymple, D.D. (1723–1814) and William M'Gill, D.D. (1732–1807), along with other "moderates," were under suspicion of similar heresies. Overt Unitarianism has never had much vogue in Scotland. The only congregation of old foundation is at Edinburgh, founded in 1776 by a secession from one of the "fellowship societies" formed by James Fraser, of Brea (1639–1699). The mission enterprises of Richard Wright (1764–1836) and George Harris (1794–1859) produced results of no great permanence. There are now seven congregations. The Scottish Unitarian Association was founded in 1813, mainly by Thomas Southwood Smith, M.D., the sanitary reformer. The McQuaker Trust was founded (1889) for propagandist purposes.

Ireland.—Controversy respecting the Trinity was excited in Ireland by the prosecution at Dublin (1703) of Thomas Emlyn (see above), resulting in fine and imprisonment, for rejecting the deity of Christ. In 1705 the Belfast Society was founded for theological discussion by Presbyterian ministers in the north, with the result of creating a body of opinion adverse to subscription to the Westminster standards. Toleration of dissent, withheld in Ireland till 1719, was then granted without the requirement of any doctrinal subscription. Next year a movement against subscription was begun in the General Synod of Ulster, culminating (1725) in the placing of the advocates of non-subscription, headed by John Abernethy, D.D., of Antrim, into a presbytery by themselves. This Antrim presbytery was excluded (1726) from jurisdiction, though not from communion. During the next hundred years its members exercised great influence on their brethren of the synod; but the counter-influence of the mission of the Scottish Seceders (from 1742) produced a reaction. The Antrim Presbytery gradually became Arian; the same type of theology affected more or less the Southern Association, known since 1806 as the Synod of Munster. From 1783 ten of the fourteen presbyteries in the General Synod had made subscription optional; the synod's code of 1824 left "soundness in the faith" to be ascertained by subscription or by examination. Against this compromise Henry Cooke, D.D. (1788–1868), directed all his powers, and was ultimately (1829) successful in defeating his Arian opponent, Henry Montgomery, LL.D. (1788–1865). Montgomery led a secession which formed (1830) the Remonstrant Synod, comprising three presbyteries. In 1910 the Antrim Presbytery, Remonstrant Synod and Synod of Munster were united as the General Synod of the non-subscribing Presbyterian Church of Ireland. They have 38 congregations and some mission stations. Till 1889 they maintained two theological chairs in Belfast, where John Scott Porter (1801–1880) was a pioneer in biblical criticism; they now send their students to England for their theological education, though in certain respects their views and practices are more conservative than those of their English brethren.

Irish Unitarian periodical literature began in 1832 with the *Bible Christian*, followed by the *Irish Unitarian Magazine*, the *Christian Unitarian*, the *Disciple* and now the *Non-subscribing Presbyterian*. See generally R. Wallace's *Antitrinitarian Biog.* (1850); G. Bonet-Maury's *Early Sources of Eng. Unit. Christianity*, trans. E. P. Hall (1884); A. Gordon's *Heads of Eng. Unit. Hist.* (1895). (A. Go.*)

United States.—Unitarianism in the United States followed essentially the same development as in England, and passed through the stages of Arminianism, Arianism, anti-tritheism, to rationalism and a modernism based on a large-minded acceptance of the results of the comparative study of all religions. In the early 18th century Arminianism presented itself in New England, and sporadically elsewhere; this tendency was largely accelerated by the reaction from the excesses of the "Great Awakening" under Jonathan Edwards and George Whitefield. Before the War of Independence Arianism showed itself in individual instances, and French influences were widespread in the direction of deism, though they were not organized into any definite utterance by religious bodies.

As early as the middle of the 18th century Harvard College represented the most advanced thought of the time, and a score or more of clergymen in New England were preaching what was essentially Unitarianism. The most prominent of these men was Jonathan Mayhew (1720–1766), pastor of the West Church in Boston from 1747 to 1766. He preached the strict unity of God, the subordinate nature of Christ, and salvation by character. Charles Chauncy (1705–1787), pastor of the First Church from 1727 until his death, the chief opponent of Edwards in the great revival, was both a Unitarian and a Universalist. Ebenezer Gay (1696–1787) of Hingham, Samuel West (1730–1807) of New Bedford, Thomas Barnard (1748–1814) of Newbury, John Prince (1751–1836) and William Bentley (1758–1819) of Salem, Aaron Bancroft (1755–1836) of Worcester, and several others, were Unitarians.

The first official acceptance of the Unitarian faith on the part of a congregation was by King's Chapel in Boston, which settled James Freeman (1759–1853) in 1782, and revised the Prayer Book into a mild Unitarian liturgy, in 1785. The Rev. William Hazlitt (father of the essayist and critic), visiting the United States in 1783–1785, published the fact that there were Unitarians in Philadelphia, Boston, Charleston, Pittsburg, Hallowell, on Cape Cod and elsewhere. Unitarian congregations were organized at Portland and Saco in 1792 by Thomas Oxnard; in 1800 the First Church in Plymouth accepted the more liberal faith. Joseph Priestley came to the United States in 1794, and organized a Unitarian Church at Northumberland, Pennsylvania, the same year, and one at Philadelphia in 1796. His writings had a considerable influence.

Thus from 1725 to 1825 a more tolerant and rational belief was developing in New England, and to some extent elsewhere. The first distinctive manifestation of the change was the inauguration of Henry Ware (1764–1845) as professor of divinity at Harvard College, in 1805. In the same year appeared Unitarian books by John Sherman (1772–1828) and Hosea Ballou (1771–1852), and another in 1810 by Noah Worcester (1758–1837). At the opening of the 19th century, with one exception, all the churches of Boston were occupied by Unitarian preachers, and various periodicals and organizations expressed their opinions. Churches were established in New York, Baltimore, Washington, Charleston and elsewhere during this period.

William Ellery Channing was settled over the Federal Street Congregational Church, Boston, 1803; and in a few years he became the leader of the Unitarian movement. At first mystical rather than rationalistic in his theology, he took part with the "Catholic Christians," as they called themselves, who aimed at bringing Christianity into harmony with the progressive spirit of the time. His essays on *The System of Exclusion and Denunciation in Religion* (1815), and *Objections to Unitarian Christianity Considered* (1819), made him a defender of Unitarianism. His sermon on "Unitarian Christianity," preached at Baltimore in 1819, at the ordination of Jared Sparks, and that at New York in 1821, on "Unitarian Christianity most favourable to Piety," made him its interpreter. The result was a growing division in the Congregational churches, which was emphasized in 1825 by the formation of the American Unitarian Association at Boston. It was organized "to diffuse the knowledge and promote the interests of pure Christianity"; and it published tracts and books, supported poor churches, sent out missionaries into every part of the country, and established new churches in nearly all the states. Essentially non-sectarian, with little missionary zeal, the Unitarian movement has grown slowly; and its influence has been chiefly exercised through general culture and the better literature of the country. Many of its clergymen have been trained in other denominations; but the Harvard Divinity School was distinctly Unitarian from its formation, in 1816, to 1870, when it became an unsectarian department of the university. The Meadville (Pa.) Theological School was founded in 1844; and the Unitarian Theological School at Berkeley, California, in 1904.

Unitarian thought in the United States has passed through three periods. The first, from 1800 to 1835, was formative, mainly influenced by English philosophy, semi-supernatural, imperfectly rationalistic, devoted to philanthropy and practical Christianity. Dr Channing was its distinguished exponent. The second, from 1835 to 1885, profoundly influenced by German idealism, was increasingly rationalistic, though its theology was largely flavoured by mysticism. In 1865 the National Unitarian Conference was organized, and adopted a distinctly Christian platform, affirming that its members were "disciples of the Lord Jesus Christ." The more rationalistic minority thereupon formed the Free Religious Association, "to encourage the scientific study of theology and to increase fellowship in the spirit." The Western Unitarian Association accepted the same position, and based its "fellowship on no dogmatic tests," but affirmed a desire "to establish truth, righteousness and love in the world." This period of controversy, and of vigorous theological development, practically came to an end soon after 1885; and its cessation was assured by the action of the national conference at Saratoga in 1894, when it was affirmed by a nearly unanimous vote: "These churches accept the religion of Jesus, holding, in accordance with his teaching, that practical religion is summed up in love to God and love to man. The conference recognizes the fact that its constituency is Congregational in tradition and polity. Therefore it declares that nothing in this constitution is to be construed as an authoritative test; and we cordially invite to our working fellowship any who, while differing from us in belief, are in general sympathy with our spirit and our practical aims." The leaders of this period were Emerson, with his idealism, and Theodore Parker, with his acceptance of Christianity as absolute religion.

The third period, beginning about 1885, has been one of rationalism, recognition of universal religion, large acceptance of the scientific method and ideas and an ethical attempt to realize the higher affirmations of Christianity. It has been marked by harmony and unity to a degree perhaps found in no other religious body, by steady growth in the number of churches and by a widening fellowship with all other progressive phases of modern religion. This last phase has been shown in the organization of "The International Council of Unitarian and other Liberal Religious Thinkers and Workers," at Boston on the 25th of May 1900, "to open communication with those in all lands who are striving to unite pure religion and perfect liberty, and to increase fellowship and co-operation among them." This council has held biennial sessions in London, Amsterdam, Geneva and Boston. During the period since 1885 the influence of Emerson has become predominant, modified by the more scientific preaching of Minot J. Savage, who has found his guides in Darwin and Spencer.

Beyond its own borders the body has obtained recognition through the public work of such men as Henry Whitney Bellows and Edward Everett Hale, the remarkable influence of James Freeman Clarke and the popular power of Robert Collyer. The number of Unitarian churches in the United States in 1909 was 461, with 541 ministers. The church membership, really nominal, may be estimated at 100,000. The periodicals are *The Christian Register*, weekly, Boston; *Unity*, weekly, Chicago; *The Unitarian*, monthly, New York; *Old and New*, monthly, Des Moines; *Pacific Unitarian*, San Francisco.

UNITED BRETHREN IN CHRIST,[1] an American religious sect which originated in the last part of the 18th century under the leadership of Philip William Otterbein (1726–1813), pastor of the Second Reformed Church in Baltimore, and Martin Boehm (1725–1812), a Pennsylvanian Mennonite of Swiss descent. Otterbein and Boehm licensed some of their followers to preach and did a great work, especially through class-meetings of a Wesleyan type;[2] in 1789 they held a formal conference at Baltimore, and in 1800, at a conference near Frederick City, Maryland, the Church was organized under its present name, and Otterbein and Boehm were chosen its first bishops or superintendents. The ecclesiastical polity of the Church is Wesleyan and its theology is Arminian: there is no hard-and-fast rule about baptism. Bishops are elected for four years. The first delegated general conference met at Mount Pleasant, Pennsylvania, in 1815, and adopted a confession of faith, rules of order and a book of discipline, which were revised in 1885–1889, when women were first admitted to ordination, and when the Conservatives, protesting against the new constitution, withdrew and formed the body now commonly known as the United Brethren in Christ "of the Old Constitution."

The Liberal branch had 3732 organizations in 1906 with a total membership of 274,649. This body carries on missions in West Africa (since 1855), Japan, China, the Philippines and Porto Rico. It has a publishing house (1834) and Bonebrake Theological Seminary (1871) at Dayton, Ohio; and supports Otterbein University (1847) at Westerville, O.; Westfield College (1865) at Westfield, Illinois; Leander Clark College (1857) at Toledo, Iowa; York College (1890) at York, Nebraska; Philomath College (1867) at Philomath, Oregon; Lebanon Valley College (1867) at Annville, Pa.; Campbell College (1864) at Holton, Kansas, and Central University (1907) at Indianapolis, Indiana.

The "Old Constitution" body had 572 organizations in 1906 with a total membership of 21,401. It has a publishing house at Huntington, Indiana.

See D. Berger, *History of the Church of the United Brethren* (1897), and his sketch (1894) in vol xii. of the "American Church History Series"; E. L. Shuey, *Handbook of the United Brethren in Christ* (1893); W. J. Shuey, *Year-Book of the United Brethren in Christ* (from 1867); and A. W. Drury, *Life of Philip William Otterbein* (1884).

UNITED FREE CHURCH OF SCOTLAND, a religious organization, representing the union made in 1900 between the Free Church of Scotland (except a dissentient section who separated off and retained the name of Free Church) and the United Presbyterian Church. (See FREE CHURCH OF SCOTLAND and UNITED PRESBYTERIAN CHURCH.)

The first moderator was Dr Rainy (*q.v.*). The Free Church brought into the union 1077 congregations, the United Presbyterians 599; the revenue of the former amounted to £706,546, of the latter to £361,743. The missionaries of both churches joined the union, and the United Church was then equipped with missions in various parts of India, in Manchuria, in Africa (Lovedale, Livingstonia, &c.), in Melanesia and in the West Indies. The formula which was adopted allowed for development of doctrine, the candidate stating that he believes "in the doctrine of this Church, set forth in the Confession of Faith," the Church being thus set above the confession. The Church has three divinity halls, at Glasgow, Edinburgh and Aberdeen, served by seventeen professors and five lecturers.

The minority of the Free Church who had refused to join the union lost no time in testing the legality of the act of the majority in entering it. Their summons, dated the 14th of December 1900, claimed that in uniting with the United Presbyterian Church, which did not hold the principles of the Free Church, the majority had forfeited the right to the property of the Free Church, which must be judged to belong to the minority who remained faithful to the principles of the Free Church and were that Church. In the Scottish courts the case was decided in favour of the union by Lord Low on the 9th of August 1901, and by the second division of the Court of Session on the 4th of July 1902, it being held in both trials that the old Free Church had a right within limits to change its views and to do by its Assembly what had been done. The proceedings before the House of Lords on appeal were protracted by the death of one of the judges, which involved the necessity of a second hearing, and it was not till the 1st of August 1904 that the verdict was pronounced. By a majority of five to two the House of Lords reversed the decision of the Court of Session, allowed the appeal, and found the minority entitled to the funds and property of the Free Church. It was held that the majority of an independent church, adopting new standards of doctrine or ceasing to hold essential or fundamental doctrines of the church, forfeit the right to the property, which remains with the minority holding the church's original doctrine: also that the establishment principle was a fundamental doctrine of the Free Church, and that by entering a union on terms leaving that doctrine an open question, the majority had violated the conditions on which the property of the Free Church was held. On the plea that by the Declaratory Act of 1892 the Free Church had abandoned its doctrinal position, argument was heard, but the House of Lords did not decide.

Few legal decisions have occasioned so great consternation or such serious practical difficulties. At first sight it deprived the Free Church section of the United Church of all its material goods—churches, manses, colleges and missions, even of the provision for the old age of the clergy. It appeared to divert large amounts of church property from the uses for which it had been provided, and to hand it over to a body with which the United Church was deeply out of sympathy and which could have little prospect of making effective use of it. A conference held in September between representatives of the United Free and of the (now distinct) Free Church, in order to come to some working arrangement in view of the decision, found that no basis for such an agreement could be arrived at. Nothing remained but to invoke the intervention of parliament to put an end to an impossible situation. A convocation of ministers and elders of the United Free Church, held on the 15th of December, decided that the union should go on, and resolved to "take every lawful means of appealing to the nation and to parliament to rescue the funds and buildings of the Church for the sacred purposes for which they had been provided." The Free Church could not refuse to consent to this, and in December a commission was appointed, consisting of Lord Elgin, Lord Kinnear and Sir Ralph Anstruther, to inquire into matters connected with the two churches, while the question of interim possession was referred to Sir John Cheyne, as commissioner, for inquiry and action. The commission sat in public, and after hearing evidence on both sides, issued their report in April 1905. They reported that the state of feeling on one side and on the other had made their work difficult. They had concluded however that the Free Church

[1] The sect is not to be confused with the Moravian Brethren (*q.v.*), whose official name, *Unitas Fratrum*, is commonly rendered in English "United Brethren."

[2] Otterbein was an intimate friend of Francis Asbury and was greatly influenced by him.

was unable in many respects to carry out the purposes of the trusts, which, under the verdict of the House of Lords, was a condition of their holding the property, and that there was a case for parliamentary interference. They recommended that an executive commission should be set up by act of parliament, in which the whole property of the Free Church, as at the date of the union, should be vested, and which should allocate it to the United Free Church, where the Free Church was unable to carry out the trust purposes. The commission was to entertain suggestions which might be made to them for friendly arrangements.

The Churches (Scotland) Act, which gave effect to these recommendations, was passed on the 11th of August 1905. It contained (see SCOTLAND, CHURCH OF) a clause (No. 5) providing for the relaxation of subscription in the Established Church, parliament thus interesting itself in the affairs of all Presbyterian churches. The commissioners were those on whose report the act was formed, with the addition of two others. In October 1906 the commission intimated that the Assembly Hall, with the New College Buildings and the High Church, were to be the property of the United Free Church, the Free Church receiving the offices in Edinburgh, and a tenement to be converted into a college, while the library was to be vested in the United Free Church, but open to members of both churches. After having occupied class-rooms in the university for two sessions, and held an assembly (1905) in another hall, the United Free Church in 1906 again occupied in its own right the historic buildings of the Free Church. All the foreign missions and all the continental stations were adjudged to the United Free Church. The allocation of churches and manses was a slow business, but in 1908 over 100 churches had been assigned to the Free Church. Some of the dispossessed United Free Church congregations, most of them in the Highlands, found shelter for a time in the parish churches; but it was early decided that in spite of the objection against the erection of more church buildings in districts where many were now standing empty, 60 new churches and manses should at once be built at a cost of about £150,000. (A. M.*)

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND,[1] the official title, since the 1st of January 1801, of the political unity composed of England and Wales, Scotland and Ireland. "Great Britain" was employed as a formal designation from the time of the union of the kingdoms of England and Scotland in 1707. Although the name (which apparently had its origin in Britannia Major, the name given to the island to distinguish it from Britannia Minor or Brittany) had, in earlier times, been often used both by English and by foreign writers, especially for rhetorical and poetical purposes, it was not till after the accession of James I. that it became a recognized part of the royal style. Its adoption was due to the king himself, who was anxious to give expression to the fact that he was sovereign of the undivided island, and not only of England or Scotland. As early as 1559 the Scottish congregation had formally proposed the union of the two crowns, and the adoption of the name of Great Britain for the common country (Teulet, *Mém. Caille à M. de la Mothe*, Dec. 20). But in England the innovation at first met with great opposition. Various objections, sentimental and practical, were urged against it in parliament; and the judges, when appealed to by the king, declared that the adoption of the title would invalidate all legal processes. At length, on the 20th of October 1604, the king, weary of the discussion, cut the knot by assuming the title by royal proclamation, and in due course the inscription "J. D. G. Mag. Brit. F. et H. Rex" appeared on his coins. In November 1604 we find the king instructing the lords commissioners of the Gunpowder Plot to try and discover if the prisoner was the author of a most "cruel pasquil" against him for assuming the name of Britain.

For further details see *Calendar of State Papers, Domestic Series*; and J. Spedding, *Letters and Life of Lord Bacon*, vol iii. (London, 1861–1874).

England and Wales, Scotland and Ireland are politically united under a parliament (*q.v.*), consisting of the king, the House of Lords[2] and the House of Commons,[3] the prerogatives of the Crown being exercised through responsible ministers. The executive government is carried on under the supervision of the ministers of state (see MINISTRY), the more important of whom are united in the cabinet (*q.v.*). The first minister of the Crown or prime minister (*q.v.*) is appointed by the king, and having made choice of his colleagues, recommends them for appointment. (See the separate articles on the various offices. For the judiciary system, see COURT; APPEAL; &c.)

The table at the foot of this column shows the imperial revenue and expenditure, with the amount of revenue per head of population of the United Kingdom for various years. The financial year now ends on the 31st of March of the year following that quoted. The figures before 1907 did not include the revenue assigned to local purposes. The deficit in 1909 was due to delay in passing the Finance Act.

Year.	Total Revenue.	Total Expenditure.	Proportion of Revenue per head.
	£	£	£ s. d.
1861	70,283,674	72,792,059	2 8 10

[2] See PEERAGE. [3] See REPRESENTATION and PARLIAMENT.

In separate articles throughout this Encyclopaedia the main subjects of interest in connexion with British institutions are fully dealt with; and it is only necessary here to give such details as are needed to supplement those given under the subject-heading. See AGRICULTURE; NAVY (also SHIP and SHIP-BUILDING); EDUCATION; ENGLISH FINANCE; ENGLISH HISTORY; CIVIL SERVICE; NATIONAL DEBT; POLICE; POOR LAW; &c. A separate section, however, is devoted to the army, the constitution of which in 1910 is described; the history is given under ARMY.

National Debt (*q.v.*).—The table on the preceding page shows the position of the national debt at quinquennial intervals during 1891–1910.

Area and Population.—The United Kingdom has an area of 120,651 sq. m., and at the census of 1891 had a population of 37,732,922 and in 1901 of 41,458,721. If the islands in British seas are included, the area is increased to 120,953 sq. m., and the population to 41,609,091. The main divisions are as follows:—

	Area sq. m.	Population.	
		1891.	1901.
England and Wales	58,324	29,002,525	32,527,843
Scotland	29,796	4,025,647	4,472,103
Ireland	32,531	4,704,750	4,458,775
Islands in the British seas	302	147,842	150,370

Vital Statistics.—The following table institutes a comparison between the birth-rates per thousand of the population in the United Kingdom and certain other countries, at intervals (so far as possible) of five years, adding the figures for other years in specific years when there was a marked fluctuation:—

	1881.	1886.	1891.	1896.	1901.	1905, 1906.	
Russia in Europe *	47·8 (1882, 50·4)	46·5	48·8	49·7	47·9	—	—
Hungary	42·9	45·6	42·3	40·5	37·8	—	36·0
Austria	37·5 (1882, 38·9)	38·1	38·3	38·0	36·6	33·7	—
Germany	37·0	37·0	37·0	36·3	35·7	33·0	—
Japan	25·6	27·3 (1889, 30·2)	26·7	30·0	32·7	30·6	—
Holland	35·0	34·6	33·7	32·7	32·3	—	30·4
Denmark	32·2	32·4	31·0 (1892, 29·6)	30·5	29·7	—	28·5
Switzerland	29·8	27·8	28·2	28·1	29·1	27·4	—
UNITED KINGDOM	32·5	31·5 (1890, 29·2)	30·4	29·0	28·0	—	26·8
England	33·9	32·8 (1890, 30·2)	31·4	29·6	28·5	—	27·1
Scotland	33·7	32·9 (1890, 30·4)	31·2 (1894, 29·9)	30·4	29·5	—	27·9
Ireland	24·5	23·2 (1890, 22·3)	23·1 (1892, 22·5)	23·7	22·7	—	23·6
Norway	30·6	31·2	30·9	30·2	29·6	—	26·5
Sweden	29·1	29·8	28·3	27·2	27·0	—	25·7
Belgium	31·8	29·9	30·0	29·0	29·4	—	25·7
France	24·9	23·9	22·6	22·5	22·0	—	20·6

The number of births in the United Kingdom in 1909 was 1,146,118, giving a rate per thousand of 25·5.
* Not including Finland.

The death-rate is similarly treated:—

	1881.	1886.	1891.	1896.	1901.	1905, 1906.	
Denmark	18·3	18·1	20·0	15·7	15·8	—	13·5

Russia in Europe*.	33·2	31·2	34·6	32·8	32·1	—	—

* Not including Finland.

The deaths in the United Kingdom in 1909 numbered 667,765, the rate per thousand being 14·8.

The number of marriages (*a*) and the proportion of persons married per thousand of the population (*b*) are thus shown:—

Year.	England and Wales.		Scotland.		Ireland.		United Kingdom.	
	(*a*)	(*b*)	(*a*)	(*b*)	(*a*)	(*b*)	(*a*)	(*b*)
1896	242,764	15·7	30,270	14·2	23,055	10·2	296,089	15·0
1901	259,400	15·9	31,387	14·0	22,564	10·2	313,351	15·1
1906	269,734	15·6	33,123	14·0	22,557	10·3	325,414	14·9
1909	260,259	14·6	30,092	12·3	22,769	10·4	313,120	13·9

Emigration.—The following table shows the number of passengers, distinguishing English and Welsh, Scottish and Irish, who left the United Kingdom for extra-European countries in 1895, 1900 and 1905, and the total for 1909, and in certain other years in which the numbers show marked fluctuations:—

Year.	English and Welsh.	Scottish.	Irish.	Total.
1895	112,538	18,294	54,349	185,181
1898	90,679	15,570	34,395	140,644
1900	102,448	20,472	45,905	168,825
1904	175,733	37,445	58,285	271,435
1905	170,408	41,510	50,159	262,077
1906	219,765	53,162	52,210	325,137

In 1909 the total number to British dominions was 163,594 and the total number to other extra-European countries was 125,167.

Occupations.—The following table shows the occupations of the people (excluding children under ten years of age) as distinguished in five great orders, according to the census of 1901:—

	England and Wales.	Scotland.	Ireland.
Professional	804,427	101,061	131,035
Domestic	1,994,197	201,230	219,418
Commercial	1,858,454	245,715	97,889
Agricultural	1,152,495	237,311	876,062
Industrial	7,534,994	1,197,495	639,413

Agriculture.—The following table illustrates broadly the difference in the position of agriculture in Great Britain and in Ireland:—

Percentage to total area of area—	Great Britain.		Ireland.	
	1890.	1909.	1890.	1909.
Cultivated	57·7	56·6	73·1	70·3
Under grain crops	14·1	12·4	7·3	6·1
Under green crops	5·8	5·4	5·8	5·0
Under grasses and other crops	8·5	7·9	5·9	11·2
In permanent pasture	28·2	30·2	53·4	43·1

Minerals and Mining.—The mineral production of the United Kingdom reached a total value in 1890 of £100,802,657 and in 1909 of £119,394,486, with a maximum during that period of £160,605,154 in 1900 and a minimum of £73,024,066 in 1893. These figures include pig-iron produced from foreign ores. About 73 % represents the value of the coal output. The figures for the more important minerals are as follows:—

Description of Minerals.	1900.	1909.	Value, 1909.
	Tons.	Tons.	£
Coal	225,181,300	263,774,312	106,274,900
Iron ore	14,025,208	14,979,979	3,689,777
Clay and shale	14,049,694	14,067,810	1,718,056
Sandstone	5,019,874	4,600,084	1,339,106
Slate	585,859	402,184	1,007,013
Limestone (not chalk)	11,905,477	11,811,122	1,226,967
Igneous rocks	4,634,301	6,283,297	1,235,046
Oil shale	2,282,221	2,967,057	815,937
Tin ore (dressed)	6,800	8,289	617,376
Salt	1,861,347	1,822,744	548,896

Gold ore, manganese ore and uranium ore are produced in small quantities, and the list of minerals worked in the United Kingdom also includes chalk, lead, alum, phosphate of lime, chert and flint, gravel and sand, zinc ore, gypsum, arsenic, copper, barytes, wolfram and strontium sulphate.

Metals were obtained from the ores as follows:—

Description of Metal.	1900.	1909.	
	Quantity.	Quantity.	Value (average market price).
			£
Iron	4,666,942 tons	4,802,163 tons	15,559,253
Tin	4,268 ,,	5,199 ,,	695,546
Lead	24,364 ,,	22,463 ,,	298,945
Zinc	9,066 ,,	3,818 ,,	87,146
Copper	765 ,,	435 ,,	27,162
Gold	14,004 oz.	1,210 oz.	4,400
Silver	190,850 ,,	142,146 ,,	14,030

The total number of persons employed in and about all the mines of the United Kingdom in 1901 was 839,178, and in 1909 1,126,372.

The workers were thus distributed between the three kingdoms and the principality in 1905:—

	Coal Mines, &c.	Metalliferous Mines (*a*).	Quarries (*b*).
England	606,206	19,561	60,725
Wales	137,124	7,333	17,277
Scotland	114,294	974	12,187
Ireland	749	733	4,464

The total figures given above include (*a*) 550 and (*b*) 166 workers in the Isle of Man; and the figures quoted for production include that of the isle.

Coal.

The production of coal in Great Britain, though marked by fluctuation, has, on the whole, largely increased, and in 1901 the output was 42% greater than that of 1881. The maximum quantity extracted in any one year between 1890 and 1910 was 267,830,962 tons in 1907, and the minimum 164,325,795 in 1893. The maximum estimated value, however, was £121,652,596 for the 225,181,300 tons raised in 1900; the value in 1907 being £120,527,378.

	1900.	1909.
England.	Tons.	Tons.
Cumberland	2,022,327	2,309,370
Derby	15,243,031	16,869,347
Durham	34,800,719	41,240,612
Gloucester	1,578,386	1,486,526
Lancashire	24,842,208	23,705,387
Leicester	2,106,343	2,661,606
Monmouth	9,818,829	13,204,357
Northumberland	11,514,521	14,013,135
Nottingham	8,626,177	11,106,702
Somerset	1,046,792	1,140,818
Stafford	14,222,743	13,517,101
Warwick	2,957,490	4,447,978
York	28,247,249	35,896,623
Wales.		
Carmarthen	1,333,880	1,950,429
Denbigh	2,447,092	2,556,612
Glamorgan	27,686,758	34,461,631

In the chief coal-producing counties of England and Wales the quantity raised in 1900 and in 1909 will be found in the table at the foot of preceding column.

Thus it appears that of the coal raised in England the county of Durham contributes about 22%, Yorkshire 17%, Lancashire 16%, Stafford and Derbyshire each about 9%, and Northumberland 7%; while of the coal raised in Wales 85% is contributed by the county of Glamorgan; and that the coal production of England and Wales together constitutes, in quantity and value, 85% of the whole production of the United Kingdom.

The export of coal greatly increased on the whole during the period 1890–1909. The following table shows this; the figures for 1893 are given as the lowest during the period. The tonnage of coke and patent fuel is included in the totals:—

Year.	Tons.	Year.	Tons.
1890	30,442,839	1900	46,098,228
1893	29,031,955	1905	49,359,272
1895	33,101,452	1909	65,694,267

The chief receiving countries are, in order, Germany, France, Italy, Sweden, Spain, Russian Empire, Denmark, Egypt, Holland, Argentina, Norway and Brazil.

Iron.

The annual output of iron ore in the United Kingdom has on the whole decreased since 1882. In that year it reached a maximum of 18,031,957 tons; it then fell off to 13,098,341 tons in 1887, rose in the two years following to nearly 15,000,000, fell to little over 11,000,000 in 1892–1893, rose fairly steadily to 14,461,330 in 1899, stood in 1900 at 14,028,208 tons of a value of £4,224,400, and then showed a further fall and rise, until in 1905 the tonnage was 14,590,703, and the value £3,482,184.

The iron ore raised in the various countries, and in the most productive counties, is here shown:—

	1900.	1909.
	Tons.	Tons.
England	13,072,118	14,176,658
Cumberland [1]	1,103,430	1,246,228
Lancashire [1]	630,361	312,367
Leicester	750,708	514,896
Lincoln	1,924,898	2,037,363
Northampton	1,622,539	2,875,659
Stafford [2]	1,084,797	902,565
York	5,550,677	6,234,589
Wales	7,418	38,043
Scotland [2]	849,031	697,276
Ireland	99,641	68,002

The number of furnaces in blast (fractions showing the proportion of the year furnaces were in blast) was: in England $298\frac{6}{12}$, Wales $19\frac{4}{12}$; Scotland $85\frac{5}{12}$, total $403\frac{3}{12}$. The total number of existing furnaces in 1900 was: in England 456, Wales 42, Scotland 106; total 604; so that 33% of the number stood unused. In 1905 furnaces in blast numbered: England $244\frac{1}{12}$, Wales $13\frac{8}{12}$, Scotland $87\frac{9}{12}$; total $345\frac{6}{12}$; and those existing: in England 412, Wales 31, Scotland 101; total 544; and the percentage unused was thus 36.

In 1888 the imports of iron ore amounted to 3,562,071 tons, in 1898 to 5,468,396 tons, in 1899 to 7,054,578 tons, in 1900 to 6,297,953 tons, in 1901 to 5,548,888 tons and in 1909 to 6,361,571 tons, of which the bulk was imported from Spain. The amount of pig-iron obtained found its minimum, during the period 1890–1910, of 6,976,990 tons in 1893, and its maximum of 10,183,860 in 1906, and in 1905 the quantity produced from foreign ores (4,847,899 tons) for the first time exceeded that produced from British ores (4,760,187).

Lead.

The quantity of lead ore produced within the United Kingdom has decreased. It is now less than one-half of the output of about 1877, and the value has decreased more than proportionately. In the period 1890–1908 the maximum annual production of metallic lead from British ore was 33,590 tons in 1890, valued at £449,826; the production fluctuated somewhat, but generally fell, to the minimum of 17,704 tons in 1902 (value £198,875). The most productive counties are Flint, Durham and Derby; the ore obtained in the Isle of Man is increased in value by the silver it contains.

[1] These counties supply the richest ore in the United Kingdom.
[2] In these cases the greater proportion of ore is from mines also producing coal.

Tin. The annual output of tin ore, which in 1878 amounted to 15,045 tons, valued at £530,737, fell to 12,898 tons in 1881, though the value in that year rose to £697,444. During the years 1882–1892 the average output was over 14,000 tons, and its average value about £770,000, but in 1893 a decline began in the output (not however accompanied closely by a decline in the value), slightly relieved about 1905.

Year.	Tin Ore.	Value.
	Tons.	£
1893	13,689	637,053
1900	6,800	523,604
1905	7,201	574,183
1909	5,193	617,376

Tin ore is obtained almost exclusively in Cornwall.

Copper. Like others of the less important mining industries, copper mining in the United Kingdom has declined. In 1881 the output of ore amounted to 52,556 tons, in 1891 to 9158 tons, in 1893 to 5576 tons, in 1905 to 7153 tons, valued at £32,696 and yielding 716 tons of metal by smelting. The total tonnage of ore included 5757 tons from England (chiefly from Cornwall) and 1146 from Ireland (Wicklow, &c.). Copper precipitate is taken from water pumped up from old copper mines on Parys Mountain in Anglesey.

Zinc. Zinc ore is obtained chiefly from mines in Cumberland, Wales and the Isle of Man. In 1881 the output reached 35,527 tons, valued at £110,043; in 1891 the output was only 22,216 tons, but its value was £113,445. In 1897 the quantity was 19,278 tons, and the value £69,134; but in 1898 the price had risen so that the output of 23,552 tons was worth £117,784. In 1900 the output of 24,675 tons was worth £97,606; and in 1905 that of 23,909 tons was worth £139,806.

Gold. During the period 1890–1905 gold mines were worked continuously in Merionethshire. Notices of the discovery of gold elsewhere (as in the Forest of Dean, Argyllshire and Ireland) have appeared from time to time.

The principal fluctuations in production were as follows:—

Year.	Ore.	Gold.	Value.
	Tons.	Oz.	£
1890	575	206	675
1891	14,117	4,008	13,700
1893	4,489	2,309	8,691
1895	13,266	6,600	18,520
1898	703	395	1,229
1900	20,802	14,004	52,147
1902	29,953	4,181	14,570
1904	23,203	19,655	73,925
1905	15,981	5,797	21,222
1908	—	915	3,311

It should be noted also that from imported cupreous iron pyrites, copper, gold and silver are extracted at some fifteen metal extraction works in Great Britain. From 386,858 tons of burnt ore in 1900 there were obtained 13,925 tons of copper, 1777 oz. of gold and 309,486 oz. of silver; and in 1905 the figures were: ore, 402,863 tons; copper, 14,502 tons; gold, 1850 oz.; silver, 322,291 oz.

Textile Industries.—The most important of the textile industries of Great Britain is cotton manufacture. *Cotton.* The quantities of raw cotton imported, exported and retained for consumption for various years during the period 1890–1910 were as follows:—

Year.	Imported.	Exported.	Retained.
	lb	lb	lb
1890	1,793,495,200	214,641,840	1,578,853,360
1893	1,416,780,064	224,621,488	1,192,158,576
1895	1,757,042,672	203,284,592	1,553,758,080
1898	2,128,548,352	203,072,464	1,925,475,888
1900	1,760,206,672	215,747,168	1,544,459,504
1905	2,203,595,520	283,177,888	1,920,417,632
1907	2,386,901,104	330,352,064	2,056,549,040
1909	2,188,761,456	268,633,456	1,920,128,000

During the same period the minimum and maximum amount of raw cotton (in lb) imported into the United Kingdom from the principal countries whence it is exported was as follows: United States of America (1893), 1,055,855,360; (1898), 1,805,353,424; Egypt (1890), 181,266,176; (1907), 423,052,448; British possessions in the East Indies (1898), 27,349,728; (1890), 238,746,704; (1909), 75,621,168; Brazil (1899), 5,464,592; (1906), 54,362,000; Peru (1891), 6,175,344; (1909), 24,413,648. In 1905 there were imported 7,941,920 lb from Chile (only 195,328 in 1909); 6,033,104 lb from Canada (this also fluctuates greatly; 1,801,072 in 1909); 1,241,408 lb from British West Africa (4,985,232 in 1909); 1,126,720 lb from the British West Indies and Guiana (3,022,208 in 1908).

According to the census returns of 1901 there were 546,065 persons employed in cotton factories, 199,920 male and 346,145 female. Of the total number of workpeople, 529,131 were employed in England and Wales, 14,805 in Scotland and 212 in Ireland. In 1907 the total had risen to 576,820 (217,742 males and 359,078 females).

Wool. The extent of the woollen and worsted manufactures of the United Kingdom is indicated by the following table showing the imports and exports of wool and the quantity retained for use in various years (1890–1905):—

Year.	Imports.	Exports of imported Wool.	Retained.
	lb	lb	lb
1890	633,028,131	340,712,303	292,315,828
1895	775,379,063	404,935,226	370,443,837
1898	699,555,048	283,317,748	416,237,300
1900	558,950,528	196,207,261	362,743,267
1905	620,350,885	277,864,215	342,486,670
1907	764,286,625	313,519,282	450,767,343
1909	808,710,087	390,695,182	418,014,905

During the same period the minimum and maximum amount of wool (in lb) imported into the United Kingdom was as follows: Australia (1904), 220,483,961; (1895), 417,163,078; New Zealand (1890), 95,632,598; (1909), 176,457,150; British possessions in South Africa (1900), 32,219,369; (1909), 115,896,598; South America (1890), 11,173,692; (1908), 78,938,157; British possessions in the East Indies (1901), 24,069,571; (1909), 56,238,633; France (1890), 10,873,788; (1902), 27,770,790; Turkish Empire (1908), 5,705,671; (1897), 25,727,462.

In the woollen and worsted industries 239,954 persons were employed according to the census of 1901, of whom 99,425 were males and 140,529 females. Of the total number 209,700 were employed in England and Wales, 24,906 in Scotland and 5348 in Ireland.

The numbers of persons employed in the other principal textile industries in 1901 was as follows:—

	England and Wales.	Scotland.	Ireland.	United Kingdom.		Total.
				Males.	Females.	
Flax . .	4,493	23,570	71,464	29,226	70,301	99,527
Hemp, jute, &c. . .	2,750	39,200	639	11,618	30,971	42,589
Silk . .	34,847	2,424	209	11,058	26,422	37,480
Hosiery .	48,374	11,957	611	15,067	45,875	60,942

Commerce.—British commerce received an enormous development after the first quarter of the 19th century. In 1826 the aggregate value of the imports into and exports from the United Kingdom amounted to no more than £88,758,678; while the total rose to £110,559,538 in 1836 and to £205,625,831 in 1846. In 1856 the aggregate of imports and exports had risen to £311,764,507, in 1866 to £534,195,956 and in 1876 to £631,931,305. Thus the commercial transactions of the United Kingdom with foreign states and British colonies increased more than sevenfold in the course of fifty years.

An important fact in connexion with the foreign commerce of the United Kingdom is that there has been a steady increase in imports, but there has been no corresponding steady increase in exports of British produce and manufactures. Many industries, which formerly were mainly in British hands, have been developed on the continent of Europe, in America, and to some extent in the East. The movement began in 1872. Up to that time the exports of British home produce had kept on increasing with the imports, although at a lesser rate, and far inferior in aggregate value; but a change took place in the latter year. While the imports continued their upward course, gradually rising from £354,693,624 in 1872 to £375,154,703 in 1876, the exports of British produce fell from £256,257,347 in 1872 to £200,639,204 in 1876. The decline in exports, regular and steady throughout the period, and with a tendency to become more pronounced every year, affected all the principal articles of British

[1] Including Cyprus in this year. [2] Including Korea. [3] Excluding Wei-hai-wei.

home produce just enumerated. The value of the cotton manufactures exported sank from £80,164,155 in 1872 to £67,641,268 in 1876; woollen fabrics from £38,493,411 to £23,020,719; iron and steel from £35,996,167 to £20,737,410; coals from £10,442,321 to £8,904,463; machinery from £8,201,112 to £7,210,426; and linen manufactures from £10,956,761 to £7,070,149. The decline during the four years, it will be seen, was greatest in all textile manufactures, and least in coal and machinery.

The table[1] on p. 602 shows the subsequent movement in value of imports from other countries to the United Kingdom, and of exports to other countries from the United Kingdom, at quinquennial intervals; bullion and specie being excluded.

As regards fluctuations not revealed by the above figures, it may be mentioned that the highest total figures for any one year during the period covered are those for 1907, viz. imports £645,807,942; exports £517,977,167. As to minima within the period, the lowest totals for British possessions were: imports £91,851,534 in 1893, and exports, the figure quoted for 1895; for foreign countries, imports £312,836,644 in 1893, and exports £195,133,239 in 1894; grand totals, imports £404,688,178 in 1893, and exports £273,785,867 in 1894. It may be added that the maximal import figures for France within the period are those of 1906 (£53,871,661), for Germany those of 1909, and for the United States those of 1901 (£141,015,465). For exports to the United States the figures for 1909 were highest, to France those of 1907 (£33,507,544) and to Germany those of 1907 (£56,729,988).

The following table presents the value of the chief groups and articles of importation into the United Kingdom:—

	1895.	1900.	1905.	1909.
	£	£	£	£
Grain and flour	53,077,981	62,992,082	70,057,290	83,107,421

1905	13 1 5	7 12 7
1906	13 18 5	8 12 0
1907	14 12 6	9 13 3
1908	13 6 3	8 9 4
1909	13 17 7	8 8 1

The tables on p. 604 show the value of unregistered imports of gold and silver bullion and specie from British possessions and from foreign countries into the United Kingdom, specifying the most important countries individually.

Shipping.—The table at foot of p. 604 shows the tonnage of vessels entered from and cleared to British possessions and foreign countries at the principal ports of the United Kingdom.

For the purpose of showing the relative importance of British and Irish ports falling below the list, the following figures may be quoted for 1909 only: Methil, entered 824,375 tons, cleared 1,105,048 tons; Harwich, entered 792,980, cleared 776,595; Grangemouth, entered 988,007, cleared 1,064,217; Burntisland, entered 609,722, cleared 815,507; Bristol, entered 858,933, cleared 615,266; Goole, entered 815,177, cleared 817,226; Hartlepool, entered 934,836, cleared 730,141; Newhaven, entered 385,313, cleared 376,083; Folkestone, entered 364,524, cleared 359,697; Belfast, entered 490,513, cleared 165,670; Borrowstounness (Bo'ness), entered 301,549, cleared 292,194; Dublin, entered 219,081, cleared 80,868; Cork, entered 146,724, cleared 7413; Maryport and Workington, entered 118,388, cleared 67,494. The figures for Plymouth have included vessels which call "off" the port to embark passengers, &c., by tender only since 1907; for 1909 they were: entered, 1,455,605; cleared, 1,292,244.

The table at the commencement of page 605 shows the total tonnage of vessels entered from and cleared to British possessions and foreign countries at ports in the United Kingdom, and also the nationality of vessels under British and the principal foreign flags.

Out of the following totals steam vessels had an aggregate tonnage of 30,604,578 entered and 31,080,481 cleared in 1890, and 64,327,508 entered and 64,968,655 cleared in 1909. The total tonnage of vessels entered and cleared coastwise was as follows: (1890), 47,738,612 entered,

[1] Adapted from the *Statistical Abstract for the United Kingdom*, where it is specified that the value of new ships and boats, with their machinery, was not included in exports before 1899.

[2] Owing to an alteration in classification these figures are not strictly comparable with those for 1905.

42,317,876, cleared; (1895), 54,304,703 entered, 47,263,791 cleared; (1900), 55,828,569 entered, 54,425,666 cleared; (1905), 60,066,919 entered, 58,670,971 cleared; (1909), 60,566,043 entered, 60,060,979 cleared.

The number and gross tonnage of the registered sailing and steam vessels belonging to the United Kingdom were as follows at the end of each of the years named:—

Year.	Sailing Vessels.		Steam Vessels.	
	Number.	Gross Tonnage.	Number.	Gross Tonnage.
1890	14,181	3,055,136	7,410	8,095,370
1895	12,617	3,040,194	8,386	9,952,211
1900	10,773	2,247,228	9,209	11,816,924
1905	10,059	1,796,826	10,552	14,883,594
1909	9,392	1,407,469	11,797	16,994,732

These figures show not only that steamers have been rapidly taking the place of sailing vessels, but also that large steamers are preferred to small, their average tonnage having increased from 1092 tons in 1895 to 1440 in 1909.

Railways.—The first ordinary roads deserving the name of highways were made about 1660, and canal-building began in the middle of the following century; but though roads and canals aided materially in raising the commercial and industrial activity of the nation, their fostering agency was very slight compared with that of railways, of which England is the birthplace. The first line of railway for regular passenger service, that from Stockton to Darlington, 14 m. in length, was opened on the 27th of September 1825. The first really important railway was the line from Manchester to Liverpool, opened on the 15th of September 1830, when William Huskisson, M.P., was accidentally killed. It took three years to get the bill for the London-Birmingham railway, which was passed at last in the session of 1833, obtaining the royal assent on the 8th of May. The first sod of the great line was cut at Chalk Farm, London, on the 1st of June 1834. Enormous engineering difficulties had to be overcome, originating not so much from the nature of the ground as from intense public prejudice against the new mode of locomotion. It took over four years to construct the railway from London to Birmingham, at a cost exceeding £4,000,000. Even friends of the railway presaged that such outlay could not by any possibility be remunerative; but the contrary became evident from the moment the line was opened on the 17th of September 1838. All the great railway systems of England sprang into existence within less than ten years after the opening of the London-Birmingham line. Out of this railway grew one of the largest companies, the London & North-Western; while the most extensive system as regards mileage, the Great Western, originated in a line from Paddington, London, to Bristol, for which an act of parliament was obtained in 1835, and which was opened in 1841. In 1836 a bill passed the legislature erecting the "Great North of England" Railway Company, from which was developed the North-Eastern system. A few years later other acts were passed, sanctioning the "Midland Counties" and the "North Midland" lines, from which the present Midland system grew.

The total length of railways conveying passengers in the United Kingdom at the end of the year 1825 was 40 m., constructed at a cost of £120,000. Five years later, at the end of 1830, there were not more than 95 m., built at a cost of £840,925, but at the end of 1835 there were 293 m., costing £5,648,531. Thus, in the first five years of railway construction, from 1825 to 1830, the mileage doubled; while in the second five years, from 1830 to 1835, it trebled. It quintupled in the next five-yearly period, till the end of 1840, when the total length of miles of railway in the kingdom had come to be 1435, built at a cost of £41,391,634, as represented by the paid-up capital of the various companies. The next five years saw nearly another doubling of length of lines, for at the end of 1845 there were 2441 m. of railway created by a paid-up capital of £88,481,376.

Not far from a fresh trebling took place in the course of the next quinquennial period, and at the end of 1850 there were 6621 m. of railways, constructed at the cost of £240,270,745.

The construction of railways (especially in England) was undertaken originally by a vast number of small companies, each under separate acts of parliament. But it was soon discovered that there could be neither harmonious nor profitable working of a great many systems, and this led to a series of amalgamations (see under ENGLAND; IRELAND; SCOTLAND).

The number of passengers carried per mile in 1832 was 4860, but before ten more years were past the number of passengers had not only increased in proportion with the opening of new lines, but more than doubled per mile, and, instead of being under 5000, had in 1842 come to be near 12,000. In 1861 the number of passengers carried per mile of railway was 15,988; in 1876 it was 31,928; and in 1900 it was over 52,000.

The two following tables illustrate the further development of railways in the United Kingdom:—

Year.	Mileage.	Paid-up Capital.	Number of Passengers.*	Traffic Receipts. Total.	Traffic Receipts. Per Mile.	Percentage of Working Expenses to Receipts.
		£		£	£	
1860	10,433	348,130,127	163,435,678	27,766,622	2,661	47
1865	13,298	455,478,143	251,862,715	35,890,116	2,701	48
1870	15,537	529,908,673	336,545,397	43,417,070	2,794	48
1875	16,658	630,223,494	506,975,234	58,982,753	3,541	54
1880	17,933	728,316,848	603,885,025	62,961,767	3,511	51
1885	19,169	815,858,055	697,213,031	66,644,967	3,477	53
1890	20,073	897,472,026	817,744,046	76,548,347	3,813	54
1895	21,174	1,001,110,221	929,770,909	81,396,047	3,844	56
1900	21,855	1,176,001,890	1,142,276,686	98,854,552	4,523	62
1905	22,847	1,272,601,000	1,199,022,102	105,131,709	4,601	62
1909	23,280	1,314,406,000	1,265,081,000	110,682,266	4,754	62

* Excluding season-ticket holders, whose number in 1880 was 502,174; in 1900, 1,749,804; and in England and Wales alone, in 1880, 449,823; in 1900, 1,610,754.

In the next table further details are given for 1909:—

		1909. England and Wales.	1909. Scotland.	1909. Ireland.
Mileage of	Double or more lines . .	10,746	1,580	670
	Single lines	5,299	2,264	2,721
		£	£	£
Traffic Receipts	Passenger traffic . . .	43,919,702	5,080,603	2,204,756
	Total goods traffic . . .	50,647,426	6,836,920	1,992,859
	Including—			
	Minerals	24,837,682	3,286,074	281,634
	General merchandise .	24,885,494	3,299,588	1,392,600
Working expenditure		65,169,619	7,200,173	2,667,796
Net receipts		37,979,313	5,489,579	1,667,572

In 1909 the percentage of working expenses to total receipts was 63 in England and Wales, 57 in Scotland and 62 in Ireland.

Tramways.—An act passed in 1870 to facilitate the construction of tramways throughout the country marks the beginning of their modern development. It led to the laying down of "street railways" in many large towns. According to a return laid before the House of Commons in the session of 1878, the total length of tramways authorized by parliament up to the 30th of June 1877 was 363 m., and the total length opened for traffic 213 m., comprising 125 m. of double lines and 88 m. of single lines. On the 30th of June 1900 there were in the United Kingdom 70 tramway undertakings with 585 m. of line belonging to local authorities, while 107 with 592 m. of line belonged to other than local authorities. The capital expenditure on the former amounted to £10,203,604, on the latter to £11,532,384.

The development of tramway enterprise in the United Kingdom, as shown by the mileage open, the paid-up capital, gross receipts, working expenses and number of passengers carried, has been as follows:—

Years ending June 30.	Miles open.	Paid-up Capital.	Gross Receipts.	Working Expenses.	Passengers carried during year.
		£	£	£	
1890	948	13,502,026	3,214,743	2,402,800	526,369,328
1895	982	14,111,521	3,733,690	2,878,490	661,760,461
1900	1177	20,582,692	5,445,629	4,075,352	1,065,374,347
1905	2117	51,501,410	9,917,026	6,565,049	2,068,913,226
1909	2526	70,345,155	12,641,437	8,045,658	2,659,981,136

AUTHORITIES.—The following publications relating to the United Kingdom are issued annually in London (unless otherwise stated): *Finance Accounts*; *Financial Estimates*; *Return showing Revenue and Expenditure (England, Scotland and Ireland)*; *National Debt Accounts*; *National Debt during 60 Years*; *Local Taxation Returns*; *Army Estimates*; *Army Accounts*; *Army List* (quarterly); *Navy Estimates*; *Navy List* (quarterly); *Royal Commission on Agriculture, Reports* (1896); *Mineral Statistics*; *Reports of Inspectors of Mines*; *Reports on Factories and Workshops*; *Reports of Inspectors of Fisheries*; *Return of Fish conveyed inland by rail*; *Statement of the Trade of the United Kingdom*; *Statement of the Shipping and Navigation of the United Kingdom*; *Report of the Postmaster-General.* Vital statistics: *Reports* of the registrars-general respectively for England, for Scotland (Edinburgh), for Ireland (Dublin); *Census Reports* (decennial, 1901, &c.), ditto; Education: *Reports of the Board of Education for England and Wales*; *Report of the Commissioners of National Education in Ireland*; *Report of the Committee of Council on Education in Scotland*; *Electoral Statistics* (London, 1905); *Statistical Tables relating to Emigration and Immigration*; *Judicial Statistics* of England and Wales, of Scotland, of Ireland; *Local Government Reports*, ditto; *Statistical Abstract for the United Kingdom*, in which the most important statistics are summarized for each of the fifteen years preceding the year of issue. Among books may be mentioned the following: Sir W. R. Anson, *The Law and Custom of the Constitution* (2 vols., 2nd ed., Oxford, 1892–1896); W. J. Ashley (edited by), *British Industries* (London, 1902); E. G. Boutmy, *Le Développement de la constitution et de la société politique en Angleterre* (2nd ed., Paris, 1897). Of this there is an English translation (from 1st ed.)

by I. M. Eaden (London, 1891); *Études de droit constitutionel, France, Angleterre, États-Unis* (Paris, 1885; Eng. trans. by E. M. Dicey, London, 1891); Brassey, *The Naval Annual* (Portsmouth, 1886 onwards); Cassell's *Gazetteer of Great Britain and Ireland* (London, 1899); W. L. Clowes and other writers, *History of the Royal Navy* (London, 1896–1901); W. Cunningham, *Growth of English Industry and Commerce* (4th ed., London, 1904); A. V. Dicey, *Introduction to the Study of the Law of the Constitution* (5th ed., London, 1897); R. Donald (edited by) *Municipal Year-book* (London, annual); S. Eardley-Wilmot, *Our Fleet To-day and its Development during the Last Half Century* (London, 1900); Hon. J. W. Fortescue, *History of the British Army* (London, 1906); R. Giffen, *Essays in Finance* (London, 1880 and 1886); R. von Gneist, *Das englische Parlament in tausendjährigen Wandelungen* (Berlin, 1885; translated into English by A. H. Keane, *History of the English Parliament*, London, 1889); *Englische Verfassungsgeschichte* (Berlin, 1882; Eng. trans. by P. A. Ashworth, London, 1891); E. Hull, *The Coalfields of Great Britain* (London, 1905); J. E. T. Rogers, *Industrial and Commercial History of England* (London, 1892); J. Holt Schooling, *The British Trade Book* (London, 1908); Sir J. R. Seeley, *The Growth of British Policy* (2 vols., London, 1895); H. Taylor, *The Origin and Growth of the English Constitution* (2 vols., London, 1889–1899); A. Todd, *Parliamentary Government in England* (new ed., revised by S. Walpole, 2 vols., London, 1892).

British Military Forces.

The forces of the British Crown may be classed as (*a*) the regular, or general service, army, together with the Indian army; and (*b*) the home territorial force; while there are also certain forces controlled by the governments of the various self-governing dominions. The home government raises, pays and controls the regular army, its reserves, the territorial force, and some few details such as the militia of the smaller possessions, Indian native battalions employed on imperial service out of India, &c. But the cost of that portion of the regular army which is in India is borne by the Indian government, which is not the case with the regulars serving in other colonies or in the dominions. Consequently the Indian government, unlike the colonial governments, can within limits dispose of the British paid regulars within its sphere.

Regular Army.—The duties of the regular army are to garrison India and overseas colonies, to garrison Great Britain and Ireland, and to find expeditionary forces of greater or less strength for war in Europe or elsewhere. The principles upon which the reorganization of 1905–1908 was based are: (*a*) that in peace the army at home must be maintained at such an effective standard that all necessary drafts for the army abroad shall be forthcoming, without undue depletion of the army at home; (*b*) the home army on mobilization for service should be brought up to war strength by the recall of reservists in sufficient, but not too great, numbers; (*c*) the wastage of a campaign shall be made good by drafts partly from the remaining army reserve, but above all from the militia, now converted into the special reserve; and (*d*) the volunteers and yeomanry, reorganized into the territorial force, shall be responsible, with little regular help, for the defence of the home country, thus freeing the regular army at home for general service. The first of these conditions entirely, the second largely, and even indirectly the third and fourth depend upon the recruiting, establishments and terms of service of the regular army. These last are a compromise between the opposite needs of short service, producing large reserves, and long service, which minimizes the sea-transport of drafts; they are also influenced by the state of the labour market at any given moment, as recruiting is voluntary. To enable the authorities to deal with these conditions, the secretary of state for war may without special legislation vary the terms of enlistment, not only in general but also for the various arms and branches.

After the South African War, several different terms were tried for the line infantry and cavalry, but these experiments proved that the terms formerly prevailing, viz. 7 years with the colours and 5 in the reserve, were the most convenient. In the Horse and Field Artillery the term is 6 and 6, in the Household Cavalry and the Garrison Artillery 8 and 4, and in the Foot Guards 3 and 9. Engineers and other specialists are recruited on various terms. A certain number, again varying from year to year, almost from month to month, are allowed to engage for the full 12 years with the colours (long service). Thus in 1907–1908, 1551 men were serving on a 12-year colour engagement, 24,856 on a term of 7 years colours and 5 reserve, 3589 on a 6 and 6 term, 3449 on 3 and 9 engagement, 4529 for other terms, out of a total of 37,974 recruits or soldiers signing fresh engagements.

The following figures show the inflow of recruits:—

Year.	Recruits offering.	Recruits approved.	Percentage approved.	Percentage of Recruits to Strength of Army.
Oct. 1903–Oct. 1904	89,824	42,041	46·8	14·6
Oct. 1904–Oct. 1905	81,045	35,551	43·9	13·05
Oct. 1905–Oct. 1906	83,155	36,380	43·5	14
Oct. 1906–Oct. 1907	72,855	34,710	47·6	14·25
Oct. 1907–Oct. 1908	77,526	37,222	47·9	14·05
Oct. 1908–Oct. 1909	75,630	33,766	44·7	13·6

The army consists of about 250,000 officers and men of the regular forces on full pay, distributed (October 1909) as follows:—

	Strength.	Establishment.
Staff and departments, &c.	3,293	3,392
On regimental strength:—		
Home	128,412	130,714
India	77,866	76,009
Colonies	47,127	44,981
Total	253,004	253,405

By units, it is composed of 3 regiments of Household Cavalry, 7 regiments of Dragoon Guards, 3 of Dragoons, 6 of Lancers and 12 of Hussars (total cavalry, 31 regiments); 4 regiments of Foot Guards of 9 battalions, 51 English and Welsh, 10 Scottish and 8 Irish line infantry and rifle regiments (total infantry, 149 battalions); the Royal Regiment of Artillery, divided into Royal Horse and Field Artillery, and Royal Garrison Artillery—the R.H.A. consisting of 28 batteries, the R.F.A. of 150 batteries, the R.G.A. of 100 companies (told off to garrisons, siege train and heavy field batteries) and 8 batteries mountain guns; the Corps of Royal Engineers, organized into mounted field troops, field companies, fortress, telegraph, railway, searchlight, balloon, wireless companies and bridging train; the Army Service Corps, divided into transport, supply, mechanical-transport and other companies and sections; the Royal Army Medical Corps of 35 companies; the Army Ordnance Corps; the Army Veterinary Corps; Army Post Office Corps (formed on mobilization only) and Army Pay Corps.

In addition, there are the following colonial troops under the home government:—West India Regiment, 2 battalions; Royal Malta Artillery, 2 garrison companies; West African Frontier Force, 2 batteries, 1 garrison company, 1 battalion M.I., 6 battalions infantry; and King's African Rifles (East Africa), 5 battalions, besides the Indian troops in imperial services.

The army reserve, formed of men who have served with the colours, consists of four classes. Sections A, B and C consist of men who are fulfilling the reserve portion of their original twelve years' liability. Section A, which receives extra allowances, is liable to be called up in a minor emergency; section B is the general reserve; section C, also part of the general reserve, consists of men who have been sent to the reserve prematurely; section D (which is often suspended) consists of men who at the expiry of their twelve years' engagement undertake a further four years' reserve liability.

Strength and Ages of the Army Reserve (Oct. 1, 1909).

Section.	A.	B & C.	D.	Total.
Infantry	4,051	70,998	9,608	84,657
Cavalry	—	8,894	1,229	10,123
R.H. & F.A.	604	13,849	1,571	16,024
R.G.A.	—	7,748	642	8,189
R.E.	415	4,200	406	5,021
Others	427	9,356	558	10,341
	5,497	115,045	14,014	134,556
Under 30.	98,146		201	98,347
30–35	21,730		10,758	32,488
Over 35	666		3,055	3,721
	120,542		14,014	134,556

The special reserve, converted from the militia, consists of infantry, field and garrison artillery, the Irish Horse (late Yeomanry), engineers, and a few A.S.C. and R.A.M.C. Its object is to make good on mobilization deficiencies (so far as they may exist after the calling in of the army reserve) in the expeditionary or regular forces, and to repair the losses of a campaign. It also acts as a feeder to the regular army. Its establishment and strength on the 1st of October 1909 were 90,664 and 69,954 respectively, without counting in the latter figure 6172 militia and militia reserve men not then absorbed into the new organization.

The war organization of the home establishment, with its general and special reserves, aimed at the mobilization and despatch overseas of 6 army divisions, each of 12 battalions in 3 brigades; 9 field batteries in 3 brigades, a brigade of 3 field howitzer batteries, and a heavy battery, each with the appropriate ammunition columns; 2 field companies and 1 telegraph company R.E.; 2 companies mounted infantry; and ambulances, columns and parks. In addition to these 6 divisions, there are "army troops" at the disposal of the commander-in-chief, consisting of two mixed "mounted brigades" (cavalry, mounted infantry, and horse artillery) serving as the "protective cavalry," and of various technical troops, such as balloon companies and bridging train. The "strategical" cavalry is a division of 4 brigades (12 regiments or 36 squadrons), with 2 brigades (4 batteries) of horse artillery, 4 "field troops" and wireless company R.E., and ambulances and supply columns. The peace organization of the regular forces at home conforms to the prospective war organization. In addition to the field army itself, various lines of communication troops are sent abroad on mobilization. These number some 20,000 men, the field army about 135,000, with 492 field guns, 7561 other vehicles and 60,769 horses and mules.

But the first condition of employing all the home regulars abroad is perfect security at home. Thus the pivot of the Haldane system is the organization of the *Territorial Force* as a completely self-contained army. The higher organization—which the volunteers (*q.v.*) and yeomanry (*q.v.*) never possessed—varies only slightly from that in vogue in the regular army. The second line army consists of 14 mixed mounted brigades as protective cavalry and 14 army divisions of much the same combatant strength as the regular divisions, the only important variation being that the artillery consists of 4-gun instead of 6-gun batteries. In addition to the divisions and mounted brigades there are "army troops," of which the most important component is the cyclist battalions, recruited in the different coast counties and specially organized as a first line of opposition to an invader. Affiliated to the territorial force are officers' training corps, cadets, "veteran reserves," and some of the other organizations mentioned below, the Haldane scheme having as its express object the utilization of every sort of contribution to national defence, whether combatant or non-combatant, on a voluntary basis.

The conditions of enlistment and reserve in the territorial force are a four years' engagement (former yeomen and volunteers being however allowed to extend for one year at a time if they desire to do so), within each year a consecutive training in camp of 14-18 days and a number of "drills" (attendances at company and battalion parades) that varies with the branch and the year of service. The minimum is practically always exceeded, and trebled or quadrupled in the case of the more enthusiastic men, and the chief difficulty with which the officers responsible for training have to contend is the fact that no man can be compelled to attend on any particular occasion. Attendance at the camp training, in so far as the claims of men's civil employment do not infringe upon it, is compulsory, and takes place at one time for all—generally the first half of August.

The army troops, divisions and mounted brigades consist of 56 regiments of yeomanry; 14 batteries and 14 ammunition columns R.H.A., 151 batteries and 55 ammunition columns R.F.A., 3 mountain batteries and ammunition column, and 14 heavy batteries and ammunition columns R.G.A.; 28 field companies, 29 telegraph companies, railway battalion, &c., R.E.; 204 battalions infantry (including 10 of cyclists, the Honourable Artillery Company, and certain corps of the Officers' Training Corps training as territorials); 60 units A.S.C.; 56 field ambulances, 23 general hospitals and 2 sanitary companies R.A.M.C. Told off to the defended seaports are 16 groups of garrison artillery companies and 58 fortress and electric light companies R.E.

Establishment and Strength (April 1, 1910)

The Territorial Force is enlisted to serve at home, but individuals and whole corps may volunteer for service abroad in war if called upon. A register is kept of those who accept this liability beforehand, and about 6000 officers and men had joined it in April 1910.

The force is trained, commanded and inspected exclusively by the military authorities, the regular army finding the higher commanders and staffs. But in accordance both with the growing tendency to separate command and administration and with the desire to enlist local sympathies and utilize local resources, "associations," partly of civilian, partly of military members, were formed in every county and charged by statute with all matters relating to the enlistment, service and discharge of the county's quota in the force, finance (other than pay, &c. in camp), buildings, ownership of regimental property, &c. To these duties of county associations are added that of supervising and administering cadet corps of all sorts (other than officers' training corps), and that of providing the extra horses required on mobilization, not only by the territorial force, but by the expeditionary force as well.

There are several groups of more or less military character which are for various reasons outside war office control. These are: (*a*) boys' brigades—the Church Lads' Brigade, the London Diocesan Brigade, the Jewish Lads' Brigade, &c.; (*b*) the Legion of Frontiersmen, an organization intended to enroll for "irregular" service men with colonial or frontier experience; (*c*) rifle clubs, which exist solely for rifle practice, and have no military liabilities; (*d*) boy scouts, an organization founded in 1908 by Lieut.-General Sir R. S. S. Baden-Powell.

Command and Administration.—The secretary of state for war is the head of the army council, which comprises the heads of departments and is the chief executive authority. These departments (see STAFF) are: the general staff; the adjutant-general's department; the quartermaster-general's department; the department of the master-general of the ordnance; the civil member's department; and the finance member's department. In addition to these departments, whose heads form the army council itself, there is the very important department of the inspector-general of the forces, whose duties are to ensure by inspection the maintenance of military efficiency and an adequate standard of instruction, &c. This department is thus in the main a complement of the general staff branch. In 1910 the commander-in-chief in the Mediterranean was appointed inspector-general of the overseas forces other than those in India, and the inspector-general in London supervises therefore only the forces in the home establishment. There are, therefore, three single authorities of high rank for the great divisions of the army—the two inspectors-general and the commander-in-chief in India.

The United Kingdom is subdivided into 7 commands and 12 districts, the commands under a lieutenant-general or general as commander-in-chief and the districts under brigadier-generals. The commands are the eastern, southern, western, northern, Scottish, Irish and the Aldershot. London is organized as a separate district under a major-general. In the colonial establishment the principal commands are the Mediterranean (including Egypt) and the South African. Except in South Africa, there are no imperial troops quartered in the self-governing colonies.

Since 1904–1905 command and administration have been separated and general officers commanding in chief relieved of administrative details by the appointment to their staffs of major-generals in charge of administration (see STAFF and OFFICERS).

Finance.—The army estimates for 1910–1911 show a total sum of £27,760,000 required for the home and colonial establishments, made up as follows (after deducting appropriations in aid):—

[1] Does not include unattached list of officers, 853, or 736 R.A.M.C. officers not available until mobilization.

Regular Army, Pay and Allowances	£8,733,000
Special Reserve	833,000
Territorial Force	2,660,000
Medical Services	452,000
Educational Establishments	147,000
Quartering, Transport, Remounts	1,589,000
Supplies, Clothing	4,397,000
Stores and Ordnance Establishment	533,000
Armament and Engineer Stores	1,482,000
Works, Buildings and Land, &c.	2,598,000
War Office and Miscellaneous	503,000
Pensions, &c.	3,833,000
	£27,760,000

The pay of the soldiers has increased since the South African War. Without allowances of any kind, it was in 1910 as follows: Warrant officer, 5s. to 6s. per day; quartermaster-sergeants, colour-sergeants, &c., 3s. 4d. to 4s. 6d.; sergeants, 2s. 4d. to 3s. 4d.; corporals, 1s. 8d. to 2s. 8d.; lance-corporals, 1s. 3d. to 1s. 9d.; privates 1s. 1d. to 1s. 9d.; boys, 8d. In addition, all receive a messing allowance of 3d. per day, 2d. for upkeep of kit, and most receive "service" or "proficiency" pay at 3d.–6d a day; and engineers, A.S.C. and R.A.M.C. specialist pay at various rates. Officers' pay, without allowances, is for second lieutenants 5s. 3d. to 7s. 8d.; lieutenants, 6s. 5d. to 8s. 10d.; captains, 11s. 7d. to 15s.; majors, 13s. 7d. to 18s. 6d.; and lieutenant-colonels, 18s. to 24s. 9d.

Indian Army.—The forces in India consist of the British army on the Indian establishment and the Indian native army with its dependent local militias, feudatories, contingents, &c. In addition there is a force of European and Eurasian volunteers, drawn largely from railway employés. The Indian army consists of 138 battalions of infantry, 10 regiments of cavalry, 16 mountain batteries, 1 garrison artillery company, 32 sapper and miner companies (2 railways companies included). The proportion between British and Indian troops observed since the Mutiny is roughly one British to two native, the Indian army being about 162,000 men. In addition the native army includes supply and transport corps, the medical service, and the veterinary service, officered in the higher ranks by officers of the A.S.C., R.A.M.C. and A.V.C. respectively.

The Indian army is recruited from Mahommedans and Hindus of various tribes and sects, and with some exceptions (chiefly in the Madras infantry) companies, sometimes regiments, are composed exclusively of men of one class. The official *F.S. Pocket Book* 1908 gives the following particulars: *Mahommedans* (Pathans of the frontier tribes, Hazaras Baluchis, Moplahs, Punjabi Mahommedans, &c.), 350 infantry companies, 76 squadrons (35% of the army). *Hindus* (Sikhs, Gurkhas, Rajputs, Jats, Dogras, Mahrattas, Tamils, Brahmans, Bhils, Garhwalis, &c.), 727 companies, 79 squadrons (63·3%).

Enlistment is entirely voluntary, and the army enjoys the highest prestige. Service is for three years, but in practice the native soldier makes the army his career and he is allowed to extend up to 32 years. The native cavalry is almost entirely *Silahdar*, in which the trooper mounts and clothes himself, and practically serves without pay. In the infantry, too, the old system of paying men and requiring them to equip, clothe and feed themselves, is in vogue to some extent. There is a reserve of the native army, numbering some 35,000 men. But it is rather a draft to replace wastage than a means of bringing the army up to a war footing in the European way. Indeed, a cardinal principle of the Indian forces, British and native alike, is that the units are maintained in peace at full war effective, often a little above their field strength. Part of the army, nearest the north-west frontier, has even its transport practically in readiness to move at once. The command is in the hands of British officers assisted by native officers, promoted from the ranks. The number of native officers in a unit is equal to that of the British officers.

Besides the regular native army there are: (*a*) various frontier and other levies, such as the Khyber Rifles and the Waziristan Militia; (*b*) selected contingents from the armies of the native princes, inspected by British officers, numbering about 20,000 and styled "imperial service troops"; (*c*) the volunteers, about 32,000 strong; and (*d*) the military police.

The general organization of the forces is into two armies, the northern and the southern, with headquarters at Rawal Pindi and Poona respectively.

Administration.—Under the governor-general in council the commander-in-chief (himself a member of the council) is the executive authority. Under him in the army department, now divided into higher committees and the headquarter staff, the latter comprising (since the abolition of the military staff department under Lord Kitchener's reorganization) the divisions of the chief of the general staff, the adjutant-general and the quartermaster-general. India has her own staff college at Quetta, and can manufacture rifles, ammunition and field artillery equipment except the actual guns.

The cost of the Indian army, and of the British forces on the Indian establishment, borne by the Indian government in 1909 was £20,558,000.

Regulars only.	Northern Army.	Southern Army.	Total.
British	40,608	34,143	74,751

Total	127,331	112,427	239,758

Forces of the Dominions and Colonies.—Lord Kitchener and Sir John French in 1909–1910 paid visits of inspection to Australia and Canada in connexion with the reorganization by the local governments of their military forces, and a beginning was made of a common organization of the forces of the empire in the colonial military conference of 1909. Without infringement of local autonomy and local conditions, a common system of drill, equipment, training and staff administration was agreed on as essential, and to that end the general staff in London was to evolve into an "imperial general staff." The object to be attained as laid down was twofold; (*a*) complete organization of the territorial forces of each dominion or colony; (*b*) evolution of contingents of colonial general-service troops with which the dominion governments might assist the army of Great Britain in wars outside the immediate borders of each dominion. (See British Empire; Australia; Canada.)

UNITED METHODIST CHURCH, or United Methodists, and English Nonconformist community formed in 1907 by the union of the Methodist New Connexion (1797), the Bible Christians (1815), and the United Methodist Free Churches (1857). The act of parliament which enabled this amalgamation received the royal assent on the 26th of July 1907, and authorized the union "to deal with real and personal property belonging to the said three churches or denominations, to provide for the vesting of the said property in trust for the United Church so formed and for the assimilation of the trusts thereof, and for other purposes." The union was completed on the 16th of September 1907 in Wesley's Chapel, City Road, London. The Church gives power of speech and vote in its meetings to every member of 18 years of age and upwards. Its principal courts are constituted of an equal number of ministers and laymen. The Church had theological colleges at Manchester and Sheffield, boys' schools at Shebbear, in Devonshire, and at Harrogate, and a girls' school at Bideford. It issues a weekly and two monthly journals. In 1908 its statistics showed 2343 chapels with accommodation for 714,793 persons, 848 ministers and 5621 local preachers, 165,463 church members and 332,756 Sunday scholars; there were 55 foreign missionaries, and about 30,000 church members and probationers in the foreign field.

UNITED METHODIST FREE CHURCHES, an English Nonconformist community merged since 1907 in the United Methodist Church (*q.v.*). The organization was itself formed in 1857 by the amalgamation of the "Wesleyan Association" (which had in 1836 largely absorbed the Protestant Methodists of 1828) and the "Wesleyan Reformers" (dating from 1849, when a number of Wesleyan Methodist ministers were expelled on a charge of insubordination).

UNITED PRESBYTERIAN CHURCH (of Scotland). This Presbyterian organization, merged since 1900 in the United Free Church of Scotland (see above), was formed in 1847 by the union of the United Secession and Relief Churches.

United Secession Church.

The general causes which led to the first great secession from the Church of Scotland, as by law established in 1688, are indicated in the article Scotland, Church of. Its immediate occasion rose out of an act of assembly of 1732, which abolished the last remnant of popular election by enacting that, in cases where patrons might neglect or decline to exercise their right of presentation the minister was to be chosen, not by the congregation, but only by the elders and Protestant heritors. The act itself had been passed by the assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were refused. In the following October Ebenezer Erskine (*q.v.*), minister of Stirling, preached a synod sermon, in the course of which he took occasion to refer to the act in question as in his opinion unscriptural and unconstitutional.[1] Some of his expressions were objected to by members of synod, and it was resolved that he should be censured for them. This judgment, on appeal, was affirmed by the assembly in May 1733, whereupon Erskine protested to the effect that he held himself still at liberty to teach the same truths and to testify against the same or similar evils on every proper occasion. This protest, in which he was joined by William Wilson (1690–1741), Alexander Moncrieff (1695–1761) and James Fisher (1697–1775), ministers at Perth, Abernethy and Kinclaven respectively, was regarded by the assembly as contumacious, and the commission of assembly was ordered to procure its retractation or to proceed to higher censures. In November accordingly the protesting ministers were severed from their charges, their churches declared vacant, and all ministers of the Church prohibited from employing them in any ministerial function. They replied by protesting that they still adhered to the principles of the Church, though now obliged to "make a secession from the prevailing party in ecclesiastical courts."

In December 1733 they constituted themselves into a presbytery, but for some time their meetings were devoted almost entirely to prayer and religious conferences. In 1734 they published their first "testimony," with a statement of the grounds of their secession, which made prominent reference to the doctrinal laxity of previous general assemblies. In 1736 they proceeded to exercise "judicial powers" as a church court, published a "judicial testimony," and began to organize churches in various parts of the country. Having been joined by four other ministers, including the well-known Ralph Erskine, they appointed Wilson professor of divinity. For these acts proceedings were again instituted against them in the assembly, with the result that, having disowned the authority of that body in an "act of declinature," there were in 1740 all deposed and ordered to be ejected from their churches. Meanwhile the members of the "Associate Presbytery" and its adherents steadily increased, until in 1745 there were forty-five congregations under its jurisdiction, and it was reconstituted into an "Associate Synod." A violent controversy arose the same year respecting the religious clause of the oath taken by burgesses in Edinburgh, Glasgow and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), and resulted in April 1747 in a "breach," when two bodies were formed, each claiming to be the "Associate Synod"; those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Antiburghers," while the other party, who contended that abstinence from it should not be made a term of communion, were designated "Burghers." The Antiburghers not only refused to hold further friendly conference with the others, but ultimately went so far as to pass sentences of deposition and the greater excommunication on the Erskines and other ministers who held the opposing view. The Associate (Antiburgher) Synod held its first meeting in Edinburgh in the house of Adam Gib (*q.v.*) on the 10th of April 1747. It grew with considerable rapidity, and in 1788 had ninety-four settled charges in Great Britain and nineteen in Ireland, besides a presbytery in America. For purposes of organization it was formed in that year into four provincial synods, and took the name of "The General Associate Synod." The "new light" controversies as to the province of the civil magistrate in matters of religion led to the publication of a revised testimony in the "voluntary" sense in 1804, and in consequence Thomas M'Crie (1772–1835), with three other brethren, withdrew to form the Constitutional Associate Presbytery. The Associate (Burgher) Synod held its first meeting at Stirling on the 16th of June 1747. The number of congregations under its charge rapidly increased, and within thirty years there were presbyteries in connexion with it in Ireland and North America, as well as throughout Scotland. In 1782 the American presbyteries took the designation of the Associate Reformed Church in America. About the year 1795 the "voluntary" controversy respecting the power of the civil magistrate in matters of religion arose within this synod also, and a large majority was found to have adopted "new light" views. This led in 1799 to the secession of the "Associate Presbytery," which in 1805 took the designation of the Associate Synod or Original Burgher Synod.[2] In 1820 the General Associate or Antiburgher Synod (to the number of 129 congregations[3]) united with the 154 congregations of the Associate or Burgher Synod. The body thus constituted, "The United Secession Church," had increased by 1847 to 400 congregations.

Relief Church.

The Presbytery of Relief was constituted in 1761 by three ministers of the Church of Scotland, one of whom was Thomas Gillespie (*q.v.*), who had been deposed by the assembly in 1752 for refusing to take part in the intrusion of unacceptable ministers. The number of congregations under its charge increased with considerable rapidity, and a Relief Synod was formed in 1773, which in 1847 had under its jurisdiction 136 congregations. The Relief Church issued no distinctive "testimonies," and a certain breadth of view was shown in the formal declaration of their terms of communion, first made in 1773, which allowed occasional communion with those of the Episcopal and Independent persuasion who are "visible saints." A Relief theological hall was instituted in 1824.

United Presbyterian Church.

In 1847 a union was formed between all the congregations of the United Secession Church and 118 out of 136 of the Relief Churches, in what now became the United Presbyterian Church. It was the first Presbyterian body to relax the stringency of subscription, the Synod passing a declaratory act on the subject in 1879. On such points as that of the six days' creation it was made clear that freedom was allowed; but when Mr David Macrae of Gourock claimed that it should also be allowed on the question of eternal punishment, he was at once declared to be no longer a minister of the church. He left behind him many who sympathized with his position, and in the remaining part of the 19th century the United Presbyterian Church came fully to share the forward movement of thought of the other Scottish churches. Doctrinally there was little difference between the United Presbyterian Church and the Free Church of Scotland, and between 1863 and 1873 negotiations were carried on for a union, which however were fruitless. But in 1896 the United Presbyterian Church again made advances, which were promptly met, and on the 31st of October 1900 the United Free Church of Scotland came into existence.

UNITED PROVINCES OF AGRA AND OUDH (formerly known as the North-Western Provinces and Oudh), a province of British India, lying between 23° 52′ and 31° 18′ N., and between 77° 3′ and 84° 39′ E. The province, including native states, has a total area of 112,243 sq. m. It is bounded N. by Tibet; N.E. by Nepal; E. by Bengal; S. by Chota Nagpur, Rewa, the Bundelkhand states, and the Central Provinces; and on the W. by Gwalior, Rajputana and the Punjab.

[1] The passing of the act was certainly unconstitutional; it was rescinded in 1734, "because not made according to former acts."

[2] The majority of this synod joined the Church of Scotland in 1839. The small minority which still retained the name joined the Original Seceders in 1842, the resultant body assuming the designation of United Original Seceders. A small majority (twenty-seven ministers in all) of the Synod of United Original Seceders joined the Free Church in 1852.

[3] A dissentient remnant (eight congregations) of the General Associate Synod united with the Constitutional Associate Presbytery in 1827, the resultant body being called the Associate Synod of Original Seceders.

Physical Aspects.—The province occupies, roughly speaking, the upper basin of the Ganges and the Jumna, corresponding to the Hindostan proper of the Mahommedan chroniclers. A large semi-circular tract, comprising the valleys of the Gogra and the Gumti, has long been separated from the remainder of the great plain as the kingdom of Oudh; and though since 1877 it has been under the administrative charge of a lieutenant-governor, it retains certain features of its former status as a chief-commissionership. The province includes the whole upper portion of the wide Gangetic basin, from the Himalayas and the Punjab plain to the Vindhyan plateau, and the low-lying ricefields of Behar. Taken as a whole, the lieutenant-governorship consists of the richest wheat-bearing country in India, irrigated both naturally by the rivers which take their rise in the northern mountains, and artificially by the magnificent system of canals which owe their origin to British enterprise. It is studded with villages, interspersed at greater distances with commercial towns. Except during the hot season, when the crops are off the fields, the general aspect in normal years is that of a verdant and well-tilled but very monotonous plain, only merging into hilly or mountainous country at the extreme edges of the basin on the south and north. The course of the great rivers marks the prevailing slope of the land, which falls away from the Himalayas, the Rajputana uplands, and the Vindhyan plateau south-eastwards towards the Bay of Bengal. The chief natural features of the province are thus determined by the main streams, whose alluvial deposits first formed the central portion of the United Provinces; while the currents afterwards cut deep channels through the detritus they brought down from the ring of hills or uplands.

The extreme or north-western Himalayan region comprises the native state of Garhwal, with the British districts of Dehra Dun, Naini Tal, Almora and Garhwal. The economic value of this mountainous tract is almost confined to the export of forest produce. South of the Himalayas, from which it is separated by valleys or *duns*, is the Siwalik range, which slopes down to the fruitful plain of the Doab (two rivers), a large irregular horn-shaped tongue of land enclosed between the Ganges and Jumna. The great boundary rivers flow through low-lying valleys fertilized by their overflow or percolation, while a high bank leads up to the central upland, which, though naturally dry and unproductive except where irrigated by wells, has been transformed by various canal systems. This favoured region may be regarded as the granary of upper India. North of the Ganges, and enclosed between that river and the Himalayas and Oudh, lies the triangular plain of Rohilkhand. This tract presents the same general features as the Gangetic valley, varied by the damp and pestilential submontane region of the *tarai* on the north-east, at the foot of the Kumaon hills. South of the Jumna is the poor and backward region of Bundelkhand, comprising the districts of Jalaun, Jhansi, Hamirpur and Banda. The soil is generally rocky and unfertile, and the population impoverished, scanty and ignorant. The southernmost portion of Bundelkhand is much cut up by spurs of sandstone and granite hills, running down from the Vindhyan system; but the northern half near the Jumna has a somewhat richer soil, and comes nearer in character to the plain of Doab. Below the junction of the Ganges and the Jumna at Allahabad the country begins to assume the appearance of the Bengal plains, and once more expands northwards to the foot of the Nepal Himalayas. This tract consists of three portions, separated by the Ganges and the Gogra. The division south of the Ganges comprises portions of Allahabad, Benares and Ghazipur, together with the whole of Mirzapur, and in general features somewhat resembles Bundelkhand, but the lowlands along the river bank are more fertile. The triangular tract between the Ganges and the Gogra and the boundary of Oudh is the most fertile corner of the Gangetic plain, and contains the densest population. The trans-Gogra region presents a wilder, submontane appearance.

Oudh forms the central portion of the great Gangetic plain, sloping downwards from the Nepal Himalayas in the north-east to the Ganges on the south-west. For 60 m. along the northern border of Gonda and Bahraich districts the boundary extends close up to the lower slopes of the Himalayas, embracing the damp and unhealthy submontane region known as the *tarai*. To the westward of this the northern boundary recedes a little from the mountain tract, and the *tarai* in this portion of the range has been for the most part ceded to Nepal. With the exception of a belt of government forest along the northern frontier, the rest of the province consists of a fertile and densely peopled plain. The greatest elevation (600 ft.) is attained in the jungle-clad plateau of Khairagarh in Kheri district, while the extreme south-east frontier is only 230 ft. above sea-level. Four great rivers traverse or skirt the plain of Oudh in converging courses —the Ganges, the Gumti, the Gogra and the Rapti. Numerous smaller channels seam the whole face of the country carrying off the surplus drainage in the rains, but drying up in the hot season. All the larger rivers, except the Gumti, as well as most of the smaller streams, have beds hardly sunk below the general level; and in time of floods they burst through their banks and carve out new channels. Numerous shallow ponds or *jhils* mark the former beds of the shifting rivers. These *jhils* have great value, not only as preservatives against inundation, but also as reservoirs for irrigation. The soil of Oudh consists of a rich alluvial deposit, the detritus of the Himalayan system washed down into the Ganges valley. Usually a light loam, it passes here and there into pure clay, or degenerates occasionally into barren sand. The uncultivable land consists chiefly of extensive *usar* plains, found in the southern and western districts, and covered by the deleterious saline efflorescence known as *reh*. Oudh possesses no valuable minerals. Salt was extensively manufactured during native rule, but the British government has prohibited this industry for fiscal reasons. Nodular limestone (*kankar*) occurs in considerable deposits, and is used as road metal.

The villages lie thickly scattered, consisting of low thatched cottages, and surrounded by patches of garden land, or groves of banyan, *pipal* and *pakar* trees. The dense foliage of the mango marks the site of almost every little homestead, no less an area than 1000 sq. m. being covered by these valuable fruit-trees. Tamarinds overhang the huts of the poorer classes, while the seat of a wealthy family may be recognized by clumps of bamboo. Plantains, guavas, jack-fruit, limes and oranges add further beauty to the village plots. The flora of the government reserved forests is rich and varied. The *sal* tree yields the most important timber; the finest logs are cut in the Khairagarh jungles and floated down the Gogra to Bahramghat, where they are sawn. The hard wood of the *shisham* is also valuable; and several other timber-trees afford materials for furniture or roofing shingle. Among the scattered jungles in various parts of the province, the *mahua* tree is prized alike for its edible flowers, its fruits and its timber. The *jhils* supply the villages with wild rice, the roots and seeds of the lotus, and the *singhara* water-nut. The fauna comprises most of the animals and birds common to the Gangetic plain; but the wild elephant is now practically unknown, except when a stray specimen loses its way at the foot of the hills. Tigers are now only found in any numbers in the wilds of Khairagarh. Leopards still haunt the cane-brakes and thickets along the banks of the rivers; and *nilgai* and antelopes abound. Game birds consist of teal and wild duck, snipe, jungle fowl and peacock.

Rivers.—The Ganges and its affluents, the Jumna, the Ramganga and the Gogra, rise in the Himalayas, and meet within the province. In addition there are the following secondary streams: the Kalinadi and the Hindan flow through the Doab; the Chambal intersects the trans-Jumna tract; in Bundelkhand the principal streams are the Betwa and the Ken; the Ramgana, rising in Garhwal, pursues a tortuous course through Rohilkhand; the Gumti flows past Lucknow and Jaunpur to join the Ganges; the trans-Gogra region is divided into two nearly equal parts by the Rapti. These rivers are constantly modifying the adjacent lands. A small obstruction may divert the stream from one side to the other. The deep stream corrodes and cuts down the high ground; but meanwhile alluvial flats are gradually piled up in the shallows. The tributary streams get choked at the mouth and assist the process of deposition. The deposit is greatest when the floods of the rainy season are subsiding.

Climate.—The climate as a whole is hot and dry. The Himalayan districts of course are cool, and have a much greater rainfall than the plains. They are succeeded by a broad submontane belt, the *tarai*, which is rendered moist by the mountain torrents, and is covered by forest from end to end. This region bears the reputation of being the most unhealthy in all India, and in many parts only the acclimatized aborigines can withstand its deadly malaria. The plain country is generally warm and dry, the heat becoming more oppressive as the general level of the country sinks towards Allahabad and Benares, or among the hills of Bundelkhand. There are three seasons. The cold changes gradually to the hot; the hot season gives way abruptly to the rains; and the rains again change gradually into the cold season. In point of humidity and temperature the province lies half-way between Bengal and the Punjab. The rainfall varies from 30 to 44 in. in the plains, increasing gradually towards the Himalaya. The temperature in the hot season ranges from 86° to 115° F., and even higher, in the shade.

Minerals.—Owing to the loamy nature of the soil, few minerals of any kind are found. Iron and coal exist in the southern hills. A little coal was extracted from Mirzapur in 1896, but the enterprise was dropped. Iron, copper, sapphires, &c., are said to be obtainable in the Himalaya. It has been suggested that the oily water known as *telya pani* indicates the presence of petroleum.

Agriculture.—Out of a total area of 104,075 sq. m. in the British districts of the province, over 54,000 sq. m. are under cultivation. The course of tillage comprises two principal harvests: the *kharif*, or autumn crops, sown in June and reaped in October or November; and the *rabi*, or spring crops, sown in October or November, and reaped in March or April. The great agricultural staple is wheat, but millets and rice are also largely cultivated. Speaking broadly, rice and oilseeds predominate in the eastern and sub-Himalayan districts, millets and cotton in Bundelkhand and wheat in the greater part of the Gangetic plain. The pulses *mung*, *urd* and *moth* are grown generally in the autumn alone, or in combination with millets; and gram, alone or in combination with wheat and barley, is an important spring crop. Sugar-cane, indigo, poppy and tobacco are locally important; and a little tea is grown in the submontane districts of Almora Garhwal and Dehra Dun.

Land Tenure.—Owing to historical reasons, the system of land tenure is not uniform. In the Benares division, which was the first portion to come under British administration, the land revenue was permanently fixed in 1795, on the same principles that had been previously adopted in Bengal; and there a special class of tenants, as well as the landlords, enjoy a privileged status. Throughout the rest of the province of Agra, almost all of which was acquired between 1801 and 1803, temporary settlements are in force, usually for a term of thirty years, the revenue being assessed at one-half of the "assets" or estimated rental value. The settlement is made with the landholders or *zamindars*, who are frequently a group of persons holding distinct shares in the land, and may be themselves petty cultivators. No proprietary rights superior to those of the actual landowners are recognized. The only privileged class of tenants are those possessing "occupancy" rights, as defined by statute. These rights, which are heritable but not transferable, protect the tenant against eviction, except for default in payment of rent, while the rent may not be enhanced except by mutual agreement or by order of a revenue court. "Occupancy" rights are acquired by continuous cultivation for ten years, but the cultivation need not be of the same holding. All other tenants are merely tenants-at-will. In Oudh, after the convulsion of the Mutiny, all rights in land were confiscated at a stroke, and the new system adopted was in the nature of a treaty between the state and the *talukdars*, or great landlords. These *talukdars* had not all the same origin. Many were Rajput chiefs, ruling over their tribesmen by ancient hereditary right; while others were officials or court favourites, who had acquired power and property during the long period of native misrule. On all the same status was now conferred—a status that has no analogy in the rest of India. By *sanad* (or patent) and by legislation the *talukdars* were declared to possess permanent, heritable and transferable rights, with the special privilege of alienation, either in lifetime or by will, notwithstanding the limits imposed by Hindu or Mahommedan law. In addition most of them follow the rule of primogeniture, while a power of entail has recently been granted. The estates of *talukdars* extend over more than half the total area of Oudh. No "occupancy" rights based on continuous cultivation are recognized in Oudh, but similar rights, here known as "sub-proprietary," were granted to all those who had possessed them within thirty years before annexation. On the other hand, there are no tenants-at-right in Oudh. Any person admitted to the cultivation of land is entitled to hold it for seven years at the same rent, which may not be advanced by more than 6¼% at the end of the term.

Manufactures.—The principal manufactures are those of sugar, indigo and coarse cotton cloth. Ornamental metal-work is made at Benares. Among the factories on the English model are the Elgin and Muir cotton mills at Cawnpore, the Cawnpore tanneries and leather factories, the Shahjahanpur rum distillery, and breweries at Mussoorie and Naini Tal. There are also woollen and jute mills, iron and brass foundries, lac factories and oil-mills. The manufacture of synthetic indigo by German chemists has greatly affected the growth and manufacture of indigo, the indigo factories decreasing in 1904–1905 from 402 to 252.

Trade.—The export trade is chiefly confined to agricultural produce. The principal staples include wheat, oilseeds, raw cotton, indigo, sugar, molasses, timber and forest produce, dry-stuffs, ghee, opium and tobacco. The imports consist mainly of English piece-goods, metal-work, manufactured wares, salt and European goods. The chief centres of trade are Cawnpore, Allahabad, Mirzapur, Benares, Meerut and Moradabad.

Irrigation.—The Doab is intersected by canals drawn from the great rivers. The major productive works are the upper and lower Ganges, the eastern Jumna, and the Agra canals. The greatest work in the province, and one of the greatest irrigation works in the world, is the upper Ganges canal, which is taken from the river where it leaves the hills, some 2 m. above Hardwar. In the first 20 m. of its course this gigantic canal crosses four great torrents, which bring down immense volumes of water in the rainy season. The first two are carried in massive aqueducts over the canal, the third is passed through the canal by a level-crossing, regulated by drop-gates, and the canal is taken over the fourth by an aqueduct. The total length of the main canal is 213 m., navigable throughout, and designed to irrigate 1,500,000 acres. The lower Ganges canal is taken from the river at Narora, 149 m. below Hardwar. After crossing in 55 m. four great drainage lines, it cuts into the Cawnpore, and 7 m. lower down into the Etawah, branches of the upper Ganges canal. These branches are now below the point of intersection, part of the lower Ganges canal system. The irrigating capacity of this canal is 1,250,000 acres.

Railways.—The province is well supplied with railways. The main line of the East Indian runs throughout south of the Ganges, which is bridged at Benares and Cawnpore. North of the river the Oudh & Rohilkhand system connects with Bengal and with the Punjab. From Allahabad, Cawnpore and Agra trade finds an outlet to the sea at Bombay as well as at Calcutta.

Administration.—The administration is conducted by a lieutenant-governor, with five secretaries and five under-secretaries. There is no executive council; but the board of revenue, consisting of two members, exercises important executive duties, and is also the highest court of appeal in revenue and rent cases. For legislative purposes the lieutenant-governor has a council, first constituted in 1886, and enlarged in 1909. It now consists of 48 members, of whom 28 are nominated, and the remainder are elected by local bodies, landholders, Mahommedans, &c. In Agra the chartered high court sitting at Allahabad, and in Oudh the court of the judicial commissioner, sitting at Lucknow, have final jurisdiction in both civil and criminal cases, subject to appeal to the privy council. The former is composed of a chief justice and six puisne judges appointed by the Crown; the latter of a judicial commissioner and two additional judicial commissioners. For ordinary purposes of administration the provinces are divided into nine divisions, each under a commissioner, and into 48 districts, each under a collector or deputy commissioner. Two native states are attached to the United Provinces—Rampur and Garhwal.

Population.—Out of a total population in 1901 of 47,691,782 no fewer than 40,691,818, or over 85% were Hindus, and 6,731,034 or 14% Mahommedans. The total number of persons belonging to all the other religions—Sikhs, Jains, Buddhists, Parsees, Christians, Jews, Aryas and Brahmos—was only 268,930, or less than 0·6%. While nearly fifty languages in all are spoken in the provinces, out of every 10,000 people 4527 speak Western Hindi, 3125 Eastern Hindi, 2109 Bihari and 211 Central Pahari.

History.—If the present limits be slightly extended in either direction so as to include Delhi and Patna, the United Provinces would contain the area on which almost the whole drama of Indian history has been played. Here lay the scene, known as *Madhya Desa* or "middle country," of the second period of Aryan colonization, when the two great epics, the *Mahabhārata* and *Ramayana*, were probably composed, and when the religion of Brahmanism took form. Here Buddha was born, preached and died. Here arose the successive dynasties of Asoka, of the Guptas, and of Harshavardhana, which for a thousand years exercised imperial sway over the greater part of India. Here is Ajodhya, the home of Rama, the most popular of Hindu demigods; and also Benares and Muttra, the most sacred of Hindu shrines. Here too were the Mahommedan capitals—Delhi, Agra, Allahabad, Jaunpur and Lucknow. Here finally, at the crisis of the Mutiny, British dominion was permanently established in India.

The political vicissitudes through which this tract of country passed in earlier times are described under INDIA: *History*. It will be sufficient here to trace the steps by which it passed under British rule. In 1765, after the battle of Buxar, when the nawab of Oudh had been decisively defeated and Shah Alam, the Mogul emperor, was a suppliant in the British camp, Lord Clive was content to claim no acquisition of territory. The whole of Oudh was restored to the Nawab, and Shah Alam received as an imperial apanage the province of Allahabad and Kora in the lower Doab, with a British garrison in the fort of Allahabad. Warren Hastings augmented the territory of Oudh by lending the nawab a British army to conquer Rohilkhand, and by making over to him Allahabad and Kora on the ground that Shah Alam had placed himself in the power of the Mahrattas. At the same time he received from Oudh the sovereignty over the province of Benares. Subsequently no great change took place until the arrival of Lord Wellesley, who acquired a very large accession of territory in two instalments. In 1801 he obtained from the nawab of Oudh the cession of Rohilkhand, the lower Doab, and the Gorakhpur division, thus enclosing Oudh on all sides except the north. In 1804, as the result of Lord Lake's victories in the Mahratta War, the rest of the Doab and part of Bundelkhand, together with

Agra and the guardianship of the old and blind emperor, Shah Alam, at Delhi, were obtained from Sindia. In 1815 the Kumaon division was acquired after the Gurkha War, and a further portion of Bundelkhand from the peshwa in 1817. These new acquisitions, known as the ceded and conquered provinces, continued to be administered by the governor-general as part of Bengal. In 1833 an act of parliament was passed to constitute a new presidency, with its capital at Agra. But this scheme was never fully carried out, and in 1835 another statute authorized the appointment of a lieutenant-governor for the North-Western Provinces, as they were then styled. They included the Delhi territory, transferred after the Mutiny to the Punjab; and also (after 1853) the Saugor and Nerbudda territories, which in 1861 became part of the Central Provinces. Meanwhile Oudh remained under its nawab, who was permitted to assume the title of king in 1819. All protests against gross misgovernment during many years having proved useless, Oudh was annexed in 1856 and constituted a separate chief commissionership. Then followed the Mutiny, when all signs of British rule were for a time swept away throughout the greater part of the two provinces. The lieutenant-governor died when shut up in the fort at Agra, and Oudh was only reconquered after several campaigns lasting for eighteen months.

In 1877 the offices of lieutenant-governor of the North-Western Provinces and chief commissioner of Oudh were combined in the same person; and in 1902, when the new name of United Provinces was introduced, the title of chief commissioner was dropped, though Oudh still retains some marks of its former independence.

See *Gazetteer of the United Provinces* (2 vols., Calcutta, 1908); and Theodore Morison, *The Industrial Organization of an Indian Province* (1906).

UNITED STATES, THE, the short title usually given to the great federal republic which had its origin in the revolt of the British colonies in North America, when, in the Declaration of Independence, they described themselves as "The Thirteen United States of America." Officially the name is "The United States of America," but "The United States" (used as a singular and not a plural) has become accepted as the name of the country; and pre-eminent usage has now made its citizens "Americans," in distinction from the other inhabitants of North and South America.

Boundaries and Area. The area of the United States, as here considered, exclusive of Alaska and outlying possessions, occupies a belt nearly twenty degrees of middle latitude in width, and crosses North America from the Atlantic to the Pacific. The southern boundary is naturally defined on the east by the Gulf of Mexico; its western extension crosses obliquely over the western highlands, along an irregular line determined by aggressive Americans of Anglo-Saxon stock against Americans of Spanish stock. The northern boundary, after an arbitrary beginning, finds a natural extension along the Great Lakes, and thence continues along the 49th parallel of north latitude to the Pacific (see *Bulletin* 171, U.S. Geological Survey). The area thus included is 3,026,789 sq. m.[1]

I.—Physical Geography

Coast.—The Atlantic coast of the United States is, with minor exceptions, low; the Pacific coast is, with as few exceptions, hilly or mountainous. The Atlantic coast owes its oblique N.E.–S.W. trend to crustal deformations which in very early geological time gave a beginning to what later came to be the Appalachian mountain system; but this system had its climax of deformation so long ago (probably in Permian time) that it has since then been very generally reduced to moderate or low relief, and owes its present altitude either to renewed elevations along the earlier lines or to the survival of the most resistant rocks as residual mountains. The oblique trend of the coast would be even more pronounced but for a comparatively modern crustal movement, causing a depression in the north-east, with a resulting encroachment of the sea upon the land, and an elevation in the south-west, with a resulting advance of the land upon the sea. The Pacific coast has been defined chiefly by relatively recent crustal deformations, and hence still preserves a greater relief than that of the Atlantic. The minor features of each coast will be mentioned in connexion with the land districts of which the coast-line is only the border.

General Topography and Drainage.—The low Atlantic coast and the hilly or mountainous Pacific coast foreshadow the leading features in the distribution of mountains within the United States. The Appalachian system, originally forest-covered, on the eastern side of the continent, is relatively low and narrow; it is bordered on the south-east and south by an important coastal plain. The Cordilleran system on the western side of the continent is lofty, broad and complicated, with heavy forests near the north-west coast, but elsewhere with trees only on the higher ranges below the Alpine region, and with treeless or desert intermont valleys, plateaus and basins, very arid in the south-west. Between the two mountain systems extends a great central area of plains, stretching from the Gulf of Mexico northward, far beyond the national boundary, to the Arctic Ocean. The rivers that drain the Atlantic slope of the Appalachians are comparatively short; those that drain the Pacific slope include only two, the Columbia and the Colorado, which rise far inland, near the easternmost members of the Cordilleran system, and flow through plateaus and intermont basins to the ocean. The central plains are divided by a hardly perceptible height of land into a Canadian and a United States portion; from the latter the great Mississippi system discharges southward to the Gulf of Mexico. The upper Mississippi and some of the Ohio basin is the prairie region, with trees originally only along the watercourses; the uplands towards the Appalachians were included in the great eastern forested area; the western part of the plains has so dry a climate that its herbage is scanty, and in the south it is barren. The lacustrine system of the St Lawrence flows eastward from a relatively narrow drainage area.

Relation of General Topography to Settlement.—The aboriginal occupants of the greater part of North America were comparatively few in number, and except in Mexico were not advanced beyond the savage state. The geological processes that placed a much narrower ocean between North America and western Europe than between North America and eastern Asia secured to the New World the good fortune of being colonized by the leading peoples of the occidental Old World, instead of by the less developed races of the Orient. The transoceanic invasion progressed slowly through the 17th and 18th centuries, delayed by the head winds of a rough ocean which was crossed only in slow sailing vessels, and by the rough "backwoods" of the Appalachians, which retarded the penetration of wagon roads and canals into the interior. The invasion was wonderfully accelerated through the 19th century, when the vast area of the treeless prairies beyond the Appalachians was offered to the settler, and when steam transportation on sea and land replaced sailing vessels and wagons. The frontier was then swiftly carried across the eastern half of the central plains, but found a second delay in its advance occasioned by the dry climate of the western plains. It was chiefly the mineral wealth of the Cordilleran region, first developed on the far Pacific slope, and later in many parts of the inner mountain ranges, that urged pioneers across the

[1] The following are the states of the Union (recognized abbreviations being given in brackets): Alabama (Ala.), Arizona (Ariz.), Arkansas (Ark.), California (Cal.), Colorado (Col.), Connecticut (Conn.), Delaware (Del.), Florida (Fla.), Georgia (Ga.), Idaho, Illinois (Ill.), Indiana (Ind.), Iowa (Ia.), Kansas (Kan.), Kentucky (Ky.), Louisiana (La.), Maine (Me.), Maryland (Md.), Massachusetts (Mass.), Michigan (Mich.), Minnesota (Minn.), Mississippi (Miss.), Missouri (Mo.), Montana (Mont.), Nebraska (Neb.), Nevada (Nev.), New Hampshire (N.H.), New Jersey (N.J.), New Mexico (N. Mex.), New York (N.Y.), North Carolina (N.C.), North Dakota (N. Dak.), Ohio (O.), Oklahoma (Okla.), Oregon (Oreg.), Pennsylvania (Pa.), Rhode Island (R.I.), South Carolina (S.C.), South Dakota (S. Dak.), Tennessee (Tenn.), Texas (Tex.), Utah, Vermont (Vt.), Virginia (Va.), West Virginia (W. Va.), Washington (Wash.), Wisconsin (Wis.), Wyoming (Wyo.); together with the District of Columbia (D.C.).

dry plains into the apparently inhospitable mountain region; there the adventurous new-comers rapidly worked out one mining district after another, exhausting and abandoning the smaller "camps" to early decay and rushing in feverish excitement to new-found river fields, but establishing important centres of varied industries in the more important mining districts. It was not until the settlers learned to adapt themselves to the methods of wide-range cattle raising and of farming by irrigation that the greater value of the far western interior was recognized as a permanent home for an agricultural population.

The purchase of "Louisiana"—a great area west of the Mississippi river—from the French in 1803 has sometimes been said to be the cause of the westward expansion of the United States, but the Louisiana purchase has been better interpreted as the occasion for the expansion rather than its cause; for, as Lewis Evans of Philadelphia long ago recognized (1749), whoever gained possession of the Ohio Valley—the chief eastern part of the central plains—would inevitably become the masters of the continent.

Physiographic Subdivisions.—The area of the United States may be roughly divided into the Appalachian belt, the Cordilleras and the central plains, as already indicated. These large divisions need physiographic subdivision, which will now be made, following the guide of "structure, process and stage"; that is, each subdivision or province will be defined as part of the earth's crust in which some similarity of geological structure prevails, and upon which some process or processes of surface sculpture have worked long enough to reach a certain stage in the cycle of physiographic development.

The Appalachians.—The physiographic description of the Appalachian mountain system offers an especially good opportunity for the application of the genetic method based on "structure, process and stage." This mountain system consists essentially of two belts: one on the south-east, chiefly of ancient and greatly deformed crystalline rocks, the other on the north-west, a heavy series of folded Palaeozoic strata; and with these it will be convenient to associate a third belt, farther north-west, consisting of the same Palaeozoic strata lying essentially horizontal and constituting the Appalachian plateau. The crystalline belt represents, at least in part, the ancient highlands from whose ruins the sandstones, shales and limestones of the stratified series were formed, partly as marine, partly as fluviatile deposits. The deformation of the Appalachians was accomplished in two chief periods of compressive deformation, one in early Palaeozoic, the other about the close of Palaeozoic time, and both undoubtedly of long duration; the second one extended its effects farther north-west than the first. These were followed by a period of minor tilting and faulting in early Mesozoic, by a moderate upwarping in Tertiary, and by a moderate uplift in post-Tertiary time. The later small movements are of importance because they are related to the existing topography with which we are here concerned. Each of the disturbances altered the attitude of the mass with respect to the general base-level of the ocean surface; each movement therefore introduced a new cycle of erosion, which was interrupted by a later movement and the beginning of a later cycle.

Thus interpreted, the Appalachian forms of to-day may be ascribed to three cycles of erosion: a nearly complete Mesozoic cycle, in which most of the previously folded and faulted mountain masses were reduced in Cretaceous time to a peneplain or lowland of small relief, surmounted, however, in the north-east and in the south-west by monadnocks of the most resistant rocks, standing singly or in groups; an incomplete Tertiary cycle, initiated by the moderate Tertiary upwarping of the Mesozoic peneplain, and of sufficient length to develop mature valleys in the more resistant rocks of the crystalline belt or in the horizontal strata of the plateau, and to develop late mature or old valleys in the weaker rocks of the stratified belt, where the harder strata were left standing up in ridges; and a brief post-Tertiary cycle, initiated by an uplift of moderate amount and in progress long enough only to erode narrow and relatively immature valleys. Glacial action complicated the work of the latest cycle in the northern part of the system. In view of all this it is possible to refer nearly every element of Appalachian form to its appropriate cycle and stage of development. The more resistant rocks, even though dissected by Tertiary erosion, retain in their summit uplands an indication of the widespread peneplain of Cretaceous time, now standing at the altitude given to it by the Tertiary upwarping and post-Tertiary uplift; and the most resistant rocks surmount the Cretaceous peneplain as unconsumed monadnocks of the Mesozoic cycle. On the other hand, the weaker rocks are more or less completely reduced to lowlands by Tertiary erosion, and are now trenched by the narrow and shallow valleys of the short post-Tertiary cycle. Evidently, therefore, the Appalachians as we now see them are not the still surviving remnants of the mountains of late Palaeozoic deformation; they owe their present height chiefly to the Tertiary upwarping and uplifting, and their form to the normal processes of sculpture which, having become nearly quiescent at the close of the Mesozoic cycle, became active again in Tertiary and later times.

The belts of structure and the cycles of erosion thus briefly described are recognizable with more or less continuity from the Gulf of St Lawrence 1500 m. south-westward to Alabama, where the deformed mountain structures pass out of sight under nearly horizontal strata of the Gulf coastal plain. But the dimensions of the several belts and the strength of the relief developed by their later erosion varies greatly along the system. In a north-eastern section, practically all of New England is occupied by the older crystalline belt; the corresponding northern part of the stratified belt in the St Lawrence and Champlain-Hudson valleys on the inland side of New England is comparatively free from the ridge-making rocks which abound farther south; and here the plateau member is wanting, being replaced, as it were, by the Adirondacks, an outlier of the Laurentian highlands of Canada which immediately succeeds the deformed stratified belt west of Lake Champlain. In a middle section of the system, from the Hudson river in southern New York to the James river in southern Virginia, the crystalline belt is narrowed, as if by the depression of its south-eastern part beneath the Atlantic Ocean or beneath the strata of the Atlantic coastal plain which now represents the ocean; but the stratified belt is here broadly developed in a remarkable series of ridges and valleys determined by the action of erosion on the many alternations of strong and weak folded strata; and the plateau assumes full strength southward from the monoclinal Mohawk valley which separates it from the Adirondacks. The linear ridges of this middle section are often called the Alleghany Mountains. In a south-western section the crystalline belt again assumes importance in breadth and height, and the plateau member maintains the strength that it had in the middle section, but the intermediate stratified belt again has fewer ridges, because of the infrequence here of ridge-making strata as compared to their frequency in the middle section.

The Middle Appalachians.

The middle section of the Appalachians, rather arbitrarily limited by the Hudson and the James rivers, may be described first because it contains the best representation of the three longitudinal belts of which the mountain system as a whole is composed. The mountain-making compression of the heavy series of Palaeozoic strata has here produced a marvellous series of rock folds with gently undulating axes, trending north-east and south-west through a belt 70 or 80 m. wide; no less wonderful is the form that has been produced by the processes of sculpture. The peculiar configuration of the ridges may be apprehended as follows: The pattern of the folded strata on the low-lying Cretaceous peneplain must have resembled the pattern of the curved grain of wood on a planed board. When the peneplain was uplifted the weaker strata were worn down almost to a lowland of a second generation, while the resistant sandstones, of which there are three chief members, retained a great part of their new-gained altitude in the form of long, narrow, even-crested ridges, well deserving of the name of Endless Mountains given them by the Indians, but here and there bending sharply in peculiar zigzags which give this Alleghany section of the mountains an unusual individuality. The post-Tertiary uplift, giving the present altitude of 1000 or 1500 ft. in Pennsylvania, and of 2500 or 3500 ft. in Virginia, has not significantly altered the forms thus produced; it has only incited the rivers to intrench themselves 100 or more feet beneath the lowlands of Tertiary erosion. The watercourses to-day are, as a rule, longitudinal, following the strike of the weaker strata in paths that they appear to have gained by spontaneous adjustment during the long Mesozoic cycle; but now and again they cross from one longitudinal valley to another by a transverse course, and there they have cut down sharp notches or "water-gaps" in the hard strata that elsewhere stand up in the long even-crested ridges.

The transition from the strongly folded structure of the Alleghany ridges and valleys to the nearly horizontal structure of the Appalachian plateau is promptly made; and with the change of structure comes an appropriate change of form. The horizontal strata of the plateau present equal ease or difficulty of erosion in any direction; the streams and the submature valleys of the plateau therefore ramify in every direction, thus presenting a pattern that has been called insequent, because it follows no apparent control. Further mention of the plateau is made in a later section.

The crystalline belt of the middle Appalachians, 60 or 80 m. wide, is to-day of moderate height because the Tertiary upwarping was there of moderate amount. The height is greatest along the inner or north-western border of the belt, and here a sub-mountainous topography has been produced by normal dissection, chiefly in the Tertiary cycle; the valleys being narrow because the rocks are resistant. The relief is strong enough to make occupation difficult; the slopes are forested; the uplands are cleared and well occupied by farms and villages, but many of the valleys are wooded glens. With continued decrease of altitude south-eastward, the crystalline belt dips under the coastal plain, near a line marked by the Delaware river from Trenton to Philadelphia in Pennsylvania, and thence south-south-westward through Maryland and Virginia past the cities of Baltimore, Washington and Richmond.

The Pennsylvania portion of the crystalline belt is narrow, as has been said, because of encroachment upon it by the inward overlap of the coastal plain; it is low because of small Tertiary uplift; but still more, it is discontinuous, because of the inclusion of certain belts of weak non-crystalline rock; here the rolling uplands are worn down to lowland belts, the longest of which reaches from the southern corner of New York, across New Jersey, Pennsylvania and Maryland, into central Virginia.

The middle section of the Appalachians is further distinguished from the north-eastern and south-western sections by the arrangement of its drainage: its chief rivers rise in the plateau belt and flow across the ridges and valleys of the stratified belt and through the uplands of the crystalline belt to the sea. The rivers which most perfectly exemplify this habit are the Delaware, Susquehanna and Potomac; the Hudson, the north-eastern boundary of the middle section, is peculiar in having headwaters in the Adirondacks as well as in the Catskills (northern part of the plateau); the James, forming the south-western boundary of the section, rises in the inner valleys of the stratified belt, instead of in the plateau. The generally transverse course of these rivers has given rise to the suggestion that they are of antecedent origin; but there are many objections to this over-simple, Gordian explanation. The south-east course of the middle-section rivers is the result of many changes from the initial drainage; the Mesozoic and Tertiary upwarpings were probably very influential in determining the present general courses.

Drainage.

For the most part the rivers follow open valleys along belts of weak strata; but they frequently pass through sharp-cut notches in the narrow ridges of the stratified belt—the Delaware water-gap is one of the deepest of these notches; and in the harder rocks of the crystalline belt they have eroded steep-walled gorges, of which the finest is that of the Hudson, because of the greater height and breadth of the crystalline highlands there than at points where the other rivers cross it. The rivers are shallow and more or less broken by rapids in the notches; rapids occur also near the outer border of the crystalline belt, as if the rivers there had been lately incited to downward erosion by an uplift of the region, and had not yet had time to regrade their courses. This is well shown in the falls of the Potomac a few miles above Washington; in the rapids of the lower Susquehanna; and in the falls of the Schuylkill, a branch which joins the Delaware at Philadelphia, where the water-power has long been used in extensive factories. Hence rivers in the Appalachians are not navigable; it is only farther down-stream, where the rivers have been converted into estuaries and bays—such as Chesapeake and Delaware bays—by a slight depression of the coastal plain belt, that they serve the purposes of navigation. But the Hudson is strikingly exceptional in this respect; it possesses a deep and navigable tide-water channel all through its gorge in the highlands, a feature which has usually been explained as the result of depression of the land, but may also be explained by glacial erosion without change of land-level; a feature which, in connexion with the Mohawk Valley, has been absolutely determinative of the metropolitan rank reached by New York City at the Hudson mouth.

The community of characteristics that is suggested by the association of six north-eastern states under the name "New England" is in large measure warranted by the inclusion of all these states within the broadened crystalline belt of the north-eastern Appalachians, which is here 150 m. wide. The uplands which prevail through the centre of this area at altitudes of about 1000 ft. rise to 1500 or 2000 ft. in the north-west, before descent is made to the lowlands of the stratified belt (St Lawrence-Champlain-Hudson valleys, described later on as part of the Great Appalachian valley), and at the same time the rising uplands are diversified with monadnocks of increasing number and height and by mature valleys cut to greater and greater depths; thus the interior of New England is moderately mountainous. When the central uplands are followed south-east or south to the coast, their altitude and their relief over the valleys gradually decrease; and thus the surface gradually passes under the sea. The lower coastal parts, from their accessibility and their smaller relief, are more densely populated; the higher and more rugged interior is still largely forested and thinly settled; there are large tracts of unbroken forest in northern Maine, hardly 150 m. from the coast. In spite of these contrasts, no physiographic line can be drawn between the higher and more rugged interior and the lower coastal border; one merges into the other. New England is a unit, though a diversified unit.

The North-eastern Appalachians.

The Appalachian trends (N.E.–S.W.) that are so prominent in the stratified belt of the middle Appalachians, and are fairly well marked in the crystalline belt of New Jersey and Pennsylvania, are prevailingly absent in New England. They may be seen on the western border, in the Hoosac range along the boundary of Massachusetts and New York; in the linear series of the Green Mountain summits (Mt Mansfield, 4364 ft., Killington Peak, 4241 ft.) and their (west) piedmont ridges farther north in Vermont; and in the ridges of northern Maine: these are all in sympathy with Appalachian structure; so also are certain open valleys, as the Berkshire (limestone) Valley in western Massachusetts and the corresponding Rutland (limestone and marble) Valley in western Vermont; and more particularly the long Connecticut Valley from northern New Hampshire across Massachusetts to the sea at the southern border of Connecticut, the populous southern third of which is broadly eroded along a belt of red Triassic sandstones with trap ridges. But in general the dissection of the New England upland is as irregular as is the distribution of the surmounting monadnocks. The type of this class of forms is Mt Monadnock in south-western New Hampshire, a fine example of an isolated residual mass rising from an upland some 1500 ft. in altitude and reaching a summit height of 3186 ft. A still larger example is seen in Mt Katahdin (5200 ft.) in north-central Maine, the greatest of several similar isolated mountains that are scattered over the interior uplands without apparent system. The White Mountains of northern New Hampshire may be treated as a complex group of monadnocks, all of subdued forms, except for a few cliffs at the head of cirque-like valleys, with Mt Washington, the highest of the dome-like or low pyramidal summits, reaching 6293 ft., and thirteen other summits over 5000 ft. The absence of range-like continuity is here emphasized by the occurrence of several low passes or "notches" leading directly through the group; the best-known being Crawford's Notch (1900 ft.).

In consequence of the general south-eastward slope of the highlands and uplands of New England, the divide between the Atlantic rivers and those which flow northward and westward into the lowland of the stratified belt in Canada and New York is generally close to the boundary of these two physiographic districts. The chief rivers all flow south or south-east: they are the Connecticut, Merrimack, Kennebec, Penobscot and St John, the last being shared with the province of New Brunswick.

Drainage.

The drainage of New England is unlike that of the middle and south-western Appalachians in the occurrence of numerous lakes and falls. These irregular features are wanting south of the limits of Pleistocene glaciation; there the rivers have had time, in the latest cycle of erosion into which they have entered, to establish themselves in a continuous flow, and as a rule to wear down their courses to a smoothly graded slope. In New England also a well-established drainage undoubtedly prevailed in preglacial times; but partly in consequence of the irregular scouring of the rock floor, and even more because of the very irregular deposition of unstratified and stratified drift in the valleys, the drainage is now in great disorder. Many lakes of moderate size and irregular outline have been formed where drift deposits formed barriers across former river courses; the lake outlets are more or less displaced from former river paths. Smaller lakes were formed by the deposition of washed drift around the longest-lasting ice remnants; when the ice finally melted away, the hollows that it left came to be occupied by ponds and lakes. In Maine lakes of both classes are numerous; the largest is Moosehead Lake, about 35 m. long and of a very irregular shore line.

The features of a coast can be appreciated only when it is perceived that they result from the descent of the land surface beneath the sea and from the work of the sea upon the shore line thus determined; and it is for this reason that throughout this article the coastal features are described in connexion with the districts of which they are the border. The maturely dissected and recently glaciated uplands of New England are now somewhat depressed with respect to sea-level, so that the sea enters the valleys, forming bays and estuaries, while the interfluve uplands and hills stand forth in headlands and islands. Narragansett Bay, with the associated headlands and islands on the south coast, is one of the best examples. Where drift deposits border the sea, the shore line has been cut back or built forward in beaches of submature expression, often enclosing extensive tidal marshes; but the great part of the shore line is rocky, and there the change from initial pattern due to submergence is as yet small. Hence the coast as a whole is irregular, with numerous embayments, peninsulas and islands; and in Maine this irregularity reaches a disadvantageous climax.

Coast.

As in the north-east, so in the south-west, the crystalline belt widens and gains in height; but while New England is an indivisible unit, the southern crystalline belt must be subdivided into a higher mountain belt on the north-west, 60 m. wide where broadest, and a lower piedmont belt on the south-east, 100 m. wide, from southern Virginia to South Carolina. This subdivision is already necessary in Maryland, where the mountain belt is represented by the Blue Ridge, which is rather a narrow upland belt than a ridge proper where the Potomac cuts across it; while the piedmont belt, relieved by occasional monadnocks, stretches from the eastern base of the Blue Ridge to the coastal plain, into which it merges. Farther south, the mountain belt widens and attains its greatest development, a true highland district, in North Carolina, where it includes several strong mountain groups. Here Mt Mitchell rises to 6711 ft., the highest of the Appalachians, and about thirty other summits exceed 6000 ft., while the valleys are usually at altitudes of about 2000 ft. Although the relief is strong, the mountain forms are rounded rather than rugged; few of the summits deserve or receive the name of peaks; some are called domes, from their broadly rounded tops, others are known as balds, because the widespread forest cover is replaced over their heads by a grassy cap.

The South-western Appalachians.

The height and massiveness of the mountains decrease to the south-west, where the piedmont belt sweeps westward around them in western Georgia and eastern Alabama. Some of the residual mountains hereabouts are reduced to a mere skeleton or framework by the retrogressive penetration of widening valleys between wasting spurs; the very type of vanishing forms. Certain districts within

the mountains, apparently consisting of less resistant crystalline rocks, have been reduced to basin-like peneplains in the same time that served only to grade the slopes and subdue the summits of the neighbouring mountains of more resistant rocks; the best example of this kind is the Asheville peneplain in North Carolina, measuring about 40 by 20 m. across; but in consequence of later elevation, its general surface, now standing at an altitude of 2500 ft., is maturely dissected by the French Broad river and its many branches in valleys 300 ft. deep; the basin floor is no longer a plain, but a hilly district in the midst of the mountains; Asheville on its southern border is a noted health resort.

The rivers of the mountain belt, normally dividing and subdividing in apparently insequent fashion between the hills and spurs, generally follow open valleys; there are few waterfalls, the streams being as a rule fairly well graded, though their current is rapid and their channels are set with coarse waste. The valley floors always join at accordant levels, as is the habit among normally subdued mountains; they thus contrast with glaciated mountains such as the Alps and the Canadian Rockies, where the laterals habitually open as "hanging valleys" in the side slope of the main valleys. It is a peculiar feature of the drainage in North Carolina that the headwaters lie to the east of the highest mountains, and that the chief rivers flow north-westward through the mountains to the broad valley lowland of the stratified belt and then through the plateau, as the members of the Mississippi system. It is probable that these rivers follow in a general way courses of much more ancient origin than those of the Atlantic rivers in the middle Appalachians.

The piedmont belt may be described as a maturely dissected peneplain over much of its extent; it is indeed one of the best examples of that class of forms. Its uplands are of fairly accordant altitude, which gradually decreases from 500 to 1000 ft. near the mountain belt to half that height along the coastal plain border. The uplands are here and there surmounted by residual monadnocks in the form of low domes and knobs; these increase in height and number towards the mountain belt, and decrease towards the coastal plain: Stone Mountain, near Atlanta, Georgia, a dome of granite surmounting the schists of the uplands, is a striking example of this class of forms. The chief rivers flow south-eastward in rather irregular courses through valleys from 200 to 500 ft. deep; the small branches ramify indefinitely in typical insequent arrangement; the streams are nearly everywhere well graded; rapids are rare and lakes are unknown.

The boundary between the mountains and the piedmont belt is called the Blue Ridge all along its length; and although the name is fairly appropriate in northern Virginia, it is not deserved in the Carolinas, where the "ridge" is only an escarpment descending abruptly 1000 or 1500 ft. from the valleys of the mountain belt to the rolling uplands of the piedmont belt; and as such it is a form of unusual occurrence. It is not defined by rock structure, but appears to result from the retrogressive erosion of the shorter Atlantic rivers, whereby the highlands, drained by much longer rivers, are undercut. The piedmont belt merges south-eastward into the coastal plain, the altitudes of the piedmont uplands and of the coastal plain hills being about the same along their line of junction. Many of the rivers, elsewhere well graded, have rapids as they pass from the harder rocks of the piedmont to the semi-consolidated strata of the coastal plain.

The Great Valley. There is one feature of the Appalachians that has greater continuity than any other; this is the Great Valley. It is determined structurally by a belt of topographically weak limestones and shales (or slates) next inland from the crystalline uplands; hence, whatever the direction of the rivers which drain the belt, it has been worn down by Tertiary erosion to a continuous lowland from the Gulf of St Lawrence to central Alabama. Through all this distance of 1500 m. the lowland is nowhere interrupted by a transverse ridge, although longitudinal ridges of moderate height occasionally diversify its surface. In the middle section, as already stated, the Great Valley is somewhat open on the east, by reason of the small height and broad interruptions of the narrow crystalline belt; on the west it is limited by the complex series of Alleghany ridges and valleys; in the north-east section the valley is strongly enclosed on the east by the New England uplands, and on the west by the Adirondacks and Catskills (see below); in the south-west section the valley broadens from the North Carolina highlands on the south-east almost to the Cumberland plateau on the north-west, for here also the ridge-making formations weaken, although they do not entirely disappear.

The Atlantic Coastal Plain. A striking contrast between New England and the rest of the Appalachians is found in the descent of the New England uplands to an immediate frontage on the sea; while to the south of New York harbour the remainder of the Appalachians are set back from the sea by the interposition of a coastal plain, one of the most characteristic examples of this class of forms anywhere to be found. As in all such cases, the plain consists of marine (with some estuarine and fluviatile) stratified deposits, more or less indurated, which were laid down when the land stood lower and the sea had its shore line farther inland than to-day. An uplift, increasing to the south, revealed part of the shallow sea bottom in the widening coastal plain, from its narrow beginning at New York harbour to its greatest breadth of 110 or 120 m. in Georgia: there it turns westward and is continued in the Gulf coastal plain, described farther on. The coastal plain, however, is the result, not of a single recent uplift, but of movements dating back to Tertiary time and continued with many oscillations to the present; nor is its surface smooth and unbroken, for erosion began upon the inner part of the plain long before the outer border was revealed. Indeed, the original interior border of the plain has been well stripped from its inland overlap; the higher-standing inner part of the plain is now maturely dissected, with a relief of 200 to 500 ft., by rivers extended seaward from the older land and by their innumerable branches, which are often of insequent arrangement; while the seaward border, latest uplifted, is prevailingly low and smooth, with a hardly perceptible seaward slope of but a few feet in a mile; and the shallow sea deepens very gradually for many miles off shore.

South Carolina and Georgia furnish the broadest and most typical section of this important physiographic province: here the more sandy and hilly interior parts are largely occupied by pine forests, which furnish much hard or yellow pine lumber, tar and turpentine. Farther seaward, where the relief is less and the soils are richer, the surface is cleared and cotton is an important crop.

A section of the coastal plain, from North Carolina to southern New Jersey, resembles the plain farther south in general form and quality of soils, but besides being narrower, it is further characterized by several embayments or arms of the sea, caused by a slight depression of the land after mature valleys had been eroded in the plain. The coastal lowland between the sea arms is so flat that, although distinctly above sea-level, vegetation hinders drainage and extensive swamps or "pocossins" occur. Dismal Swamp, on the border of North Carolina and Virginia, is the largest example.

The small triangular section of the coastal plain in New Jersey north of Delaware Bay deserves separate treatment because of the development there of a peculiar topographic feature, which throws light on the occurrence of the islands off the New England coast, described in the next paragraph. The feature referred to results from the occurrence here of a weak basal formation of clay overlaid by more resistant sandy strata; the clay belt has been stripped for a score or more of miles from its original inland overlap, and worn down in a longitudinal inner lowland, while the sandy belt retains a significant altitude of 200 or 300 ft. overlooking the inner lowland in a well-defined slope dissected by many inland-flowing streams, and descending from its broad crest very gently seaward, thus giving rise to what has been called a "belted coastal plain," in which the relief is arranged longitudinally and the upland member, with its very unsymmetrical slopes, has sometimes been called a "cuesta." This is a form of relief frequently occurring elsewhere, as in the Niagara cuesta of the Great Lake district of the northern United States and in the Cotswold and Chiltern hills of England, typical examples of the cuesta class. The Delaware river, unlike its southern analogues, which pursue a relatively direct course to the sea, turns south-westward along the inner lowland for some 50 m.

There is good reason for believing that at least along the southern border of New England a narrow coastal plain was for a time added to the continental border; and that, as in the New Jersey section, the plain was here stripped from a significant breadth of inland overlap and worn down so as to form an inner lowland enclosed by a longitudinal upland or cuesta; and that when this stage was reached a submergence, of the kind which has produced the many embayments of the New England coast, drowned the outer part of the plain and the inner lowland, leaving only the higher parts of the cuesta as islands. Thus Long Island (fronting Connecticut, but belonging to New York state), Block Island (part of the small state of Rhode Island), Martha's Vineyard and Nantucket (parts of Massachusetts) may be best explained. Heavy terminal moraines and outwashed fluviatile plains have been laid on the cuesta remnants, increasing their height as much as 100 ft. and burying their seaward slope with gravel and sand. Moreover, the sea has worked on the shore line thus originated, reducing the size of the more exposed islands farther east, and even consuming some islands which are now represented by the Nantucket shoals.

The Appalachian Plateau. The same Palaeozoic formations that are folded in the belt of the Alleghany ridges lie nearly horizontal in the plateau district next north-west. The exposed strata are in large part resistant sandstones. While they have suffered active dissection by streams during the later cycles of erosion, the hilltops have retained so considerable an altitude that the district is known as a plateau; it might be better described as a dissected plateau, inasmuch as its uplands are not continuous but are nearly everywhere interrupted by ramifying insequent valleys. The unity and continuity of the district, expressed in the name Appalachian plateau, is seldom recognized in local usage. Its north-eastern part in eastern New York is known as the Catskill Mountains; here it reaches truly mountainous heights in great dome-like masses of full-bodied form, with two summits rising a little over 4000 ft. The border of this part of the plateau descends eastward by a single strong escarpment to the Hudson valley, from which the mountains present a fine appearance, and northward by two escarpments (the second being called the "Helderberg Mountains") to the Mohawk Valley, north of which rise the

Adirondacks; but to the south west the dissected highland continues into Pennsylvania and Virginia, where it is commonly known as the Alleghany plateau. A curious feature appears in northern Pennsylvania: here the lateral pressure of the Palaeozoic mountain-making forces extended its effects through a belt about fifty miles wider than the folded belt of the Hudson Valley, thus compressing into great rock waves a part of the heavy stratified series which in New York lies horizontal and forms the Catskills; hence one sees, in passing south-west from the horizontal to the folded strata, a beautiful illustration of the manner in which land sculpture is controlled by land structure. Altitudes of 1200 ft. prevail in Pennsylvania and increase in Virginia; then the altitude falls to about 1000 ft. in Kentucky and Tennessee, where the name Cumberland plateau is used for the highest portion, and to still less in northern Alabama, where the plateau, like the mountain belt, disappears under the Gulf coastal plain. Through all this distance of 1000 m. the border of the plateau on the south-east is an abrupt escarpment, eroded where the folded structure of the mountain belt reveals a series of weaker strata; but in the north-west the plateau suffers only a gradual decrease of height and of relief, until the prairie plains are reached in central Ohio and southern Indiana and Illinois, about 150 m. inland from the escarpment. Two qualifications must, however, be added. In certain parts of the plateau there are narrow anticlinal uplifts, an outlying effect of mountain-making compression; here a ridge rises if the exposed strata are resistant, as in Chestnut ridge of western Pennsylvania; but here a valley is excavated if the exposed strata are weak, as in Sequatchie Valley, a long narrow trough which cuts off a strip of the plateau from its greater body in Tennessee. Again, in Kentucky and Tennessee, there is a double alternation of sandstone and limestone in the plateau-making strata; and as the skyline of the plateau bevels across these formations, there are west-facing escarpments, made ragged by mature dissection, as one passes from the topographically strong sandstone to the topographically weak limestone.

In the north-east (New York and Pennsylvania) the higher parts of the plateau are drained by the Delaware and Susquehanna rivers directly to the Atlantic; farther west and south-west, the plateau is drained to the Ohio river and its branches. The submature or mature dissection of the plateau by its branching insequent streams results in giving it an excess of sloping surface, usually too steep for farming, and hence left for tree growth.

The Superior Oldland.—An outlying upland of the Laurentian highlands of Canada projects into the United States west and south of Lake Superior. Although composed chiefly of crystalline rocks, which are commonly associated with a rugged landscape, and although possessing a greatly deformed structure, which must at some ancient period have been associated with strong relief, the upland as a whole is gently rolling, and the inter-stream surfaces are prevailing plateau-like in their evenness, with altitudes of 1400 to 1600 ft. in their higher areas. In this province, therefore, we find a part of one of those ancient mountain regions, initiated by crustal deformation, but reduced by long continued erosion to a peneplain of modern relief, with occasional surmounting monadnocks of moderate height not completely consumed during the peneplanation of the rest of the surface. The erosion of the region must have been far advanced, perhaps practically completed, in very ancient times, for the even surface of the peneplain is overlapped by fossiliferous marine strata of early geological date (Cambrian); and this shows that a depression of the region beneath an ancient sea took place after a long existence as dry land. The extent of the submergence and the area over which the Palaeozoic strata were deposited are unknown; for in consequence of renewed elevation without deformation, erosion in later periods has stripped off an undetermined amount of the covering strata. The valleys by which the uplands are here and there trenched to moderate depth appear to be, in part at least, the work of streams that have been superposed upon the peneplain through the now removed cover of stratified rocks. Glaciation has strongly scoured away the deeply-weathered soils that presumably existed here in preglacial time, revealing firm and rugged ledges in the low hills and swells of the ground, and spreading an irregular drift cover over the lower parts, whereby the drainage is often much disordered; here being detained in lakes and swamps (" muskegs ") and there rushing down rocky rapids. The region is therefore generally unattractive to the farmer, but it is inviting to the lumberman and the miner.

The Adirondack Mountains.—This rugged district of northern New York may be treated as an outlier in the United States of the Laurentian highlands of Canada, from which it is separated by the St Lawrence Valley. It is of greater altitude (Mt Marcy 5344 ft.) and of much greater relief than the Superior Oldland; its heights decrease gradually to the north, west and south, where it is unconformably overlapped by Palaeozoic strata like those of Minnesota and Wisconsin; it is of more broken structure and form on the east, where the disturbances of the Appalachian system have developed ridges and valleys of linear trends, which are wanting or but faintly seen elsewhere. (See ADIRONDACKS.)

Region of the Great Lakes.—The Palaeozoic strata, already mentioned as lapping on the southern slope of the Superior Oldland and around the western side of the Adirondacks are but parts of a great area of similar strata, hundreds of feet in thickness, which decline gently southward from the great oldland of the Laurentian highlands of eastern Canada. The strata are the deposits of an ancient sea, which in the earlier stage of geological investigation was thought to be part of the primeval ocean, while the Laurentian highlands were taken to be the first land that rose from the primeval waters. Inasmuch, however, as the floor on which the overlapping strata rest is, like the rest of the Laurentian and Superior Oldland, a worn-down mountain region, and as the lowest member of the sedimentary series usually contains pebbles of the oldland rocks, the better interpretation of the relation between the two is that the visible oldland area of to-day is but a small part of the primeval continent, the remainder of which is still buried under the Palaeozoic cover; and that the visible oldland, far from being the first part of the continent to rise from the primeval ocean, was the last part of the primeval continent to sink under the advancing Palaeozoic seas. When the oldland and its overlap of stratified deposits were elevated again, the overlapping strata must have had the appearance of a coastal plain; but that was long ago; the strata have since then been much eroded, and to-day possess neither the area nor the smooth form of their initial extent. Hence this district may be placed in the class of ancient coastal plains. As is always the case in the broad denudation of the gently inclined strata of such plains, the weaker layers are worn down in sub-parallel belts of lower land between the oldland and the belts of more resistant strata, which rise in uplands.

Few better illustrations of this class of forms are to be found than that presented in the district of the Great Lakes. The chief upland belt or cuesta is formed by the firm Niagara limestone, which takes its name from the gorge and falls cut through the upland by the Niagara river. As in all such forms, the Niagara cuesta has a relatively strong slope or infacing escarpment on the side towards the oldland, and a long gentle slope on the other side. Its relief is seldom more than 200 or 300 ft., and is commonly of small measure, but its continuity and its contrast with the associated lowlands worn on the underlying and overlying weak strata suffice to make it a feature of importance. The cuesta would be straight from east and west if the slant of the strata were uniformly to the south; but the strata are somewhat warped, and hence the course of the cuesta is strongly convex to the north in the middle, gently convex to the south at either end. The cuesta begins where its determining limestone begins, in west-central New York; there it separates the lowlands that contain the basins of lakes Ontario and Erie; thence it curves to the north-west through the province of Ontario to the belt of islands that divides Georgian Bay from Lake Huron; then westward through the land-arm between lakes Superior and Michigan, and south-westward into the narrow points that divide Green Bay from Lake Michigan, and at last westward to fade away again with the thinning out of the limestone; it is hardly traceable across the Mississippi river. The arrangement of the Great Lakes is thus seen to be closely sympathetic with the course of the lowlands worn on the two belts of weaker strata on either side of the Niagara cuesta; Ontario, Georgian Bay and Green Bay occupy depressions in the lowland on the inner side of the cuesta; Erie, Huron and Michigan lie in depressions in the lowland on the outer side. When the two lowlands are traced eastward they become confluent after the Niagara limestone has faded away in central New York, and the single lowland is continued under the name of Mohawk Valley, an east-west longitudinal depression that has been eroded on a belt of relatively weak strata between the resistant crystalline rocks of the Adirondacks on the north and the northern escarpment of the Appalachian plateau (Catskills-Helderbergs) on the south; forming a pathway of great historic and economic importance between the Atlantic seaports and the interior.

In Wisconsin the inner lowland presents an interesting feature in a knob of resistant quartzites, known as Baraboo Ridge, rising from the buried oldland floor through the partly denuded cover of lower Palaeozoic strata. This knob or ridge may be appropriately regarded as an ancient physiographic fossil, inasmuch as, being a monadnock of very remote origin, it has long been preserved from the destructive attack of the weather by burial under sea-floor deposits, and recently laid bare, like ordinary organic fossils of much smaller size, by the removal of part of its cover by normal erosion.

The occurrence of the lake basins in the lowland belts on either side of the Niagara cuesta is an abnormal feature, not to be explained by ordinary erosion, which can produce only valleys. The basins have been variously ascribed to glacial erosion, to obstruction of normal outlet valleys by barriers of glacial drift, and to crustal warping in connexion with or independent of the presence of the glacial sheet. No satisfactory solution of this problem has been reached; but the association of the Great Lakes and other large lakes farther north in Canada with the great North American area of strong and repeated glaciation is highly suggestive.

Lake Superior is unlike the other lakes; the greater part of its basin occupies a depression in the oldland area, independent of the overlap of Palaeozoic strata. The western half of the basin occupies a trough of synclinal structure; but the making of this syncline is so ancient that it cannot be directly connected with the occurrence of the lake to-day. A more reasonable explanation ascribes the lake basin to a geologically modern depression within the Superior oldland area; but there is at present no direct evidence in favour of this hypothesis. The Great Lakes are peculiar in receiving the drainage of but a small peripheral land area, enclosed by an ill-defined water-parting from the rivers that run to Hudson Bay or the Gulf of St Lawrence on the north and to the Gulf of Mexico on the south.

Large canals and locks on both sides of the Sault (pronounced *Soo*) Ste Marie in the outlet of Lake Superior are actively used except during three or four winter months. The three lakes of the middle group stand at practically the same level: Michigan and Huron are connected by the Strait of Mackinac (pronounced Mackinaw); Huron and Erie by the St Clair and Detroit rivers, with the small Lake St Clair between them. The navigable depth of these two short rivers is believed to be the result of a slow elevation of the land in the north-east, still in progress, whereby the waters have risen on their former shores near Detroit. Niagara river, connecting lakes Erie and Ontario, with a fall of 326 ft. (160 ft. at the cataract) in 30 m., is manifestly a watercourse of very modern origin; for a large river would now have a thoroughly matured valley had it long followed its present course; the same is true of the St Lawrence, which in its several rapids and in its subdivision into many channels at the Thousand Islands, presents every sign of youth. Canals on the Canadian side of these unnavigable stretches admit vessels of a considerable size to lakes Ontario and Erie.

The Prairie States.—The originally treeless prairies of the upper Mississippi basin began in Indiana and extended westward and north-westward until they merged with the drier region described beyond as the Great Plains. An eastward extension of the same region, originally tree-covered, extended to central Ohio. Thus the prairies may be described as lying in a general way between the Ohio and Missouri rivers on the south and the Great Lakes on the north. Under the older-fashioned methods of treating physical geography, the prairies were empirically described as "level prairies," "rolling prairies," and so on. The great advance in the interpretation of land forms now makes it possible to introduce as thoroughly explanatory a description of these fertile plains as of forms earlier familiar, such as sand dunes, deltas and sea cliffs. The prairies are, in brief, a contribution of the glacial period; they consist for the most part of glacial drift, deposited unconformably on an underlying rock surface of moderate or small relief. The rocks here concerned are the extension of the same stratified Palaeozoic formations already described as occurring in the Appalachian region and around the Great Lakes. They are usually fine-textured limestones and shales, lying horizontal; the moderate or small relief that they were given by mature preglacial erosion is now buried under the drift, but is known by numerous borings for oil, gas and water.

The greatest area of the prairies, from Indiana to North Dakota, consists of till plains, that is, sheets of unstratified drift, 30, 50 or even 100 ft. thick, which cover the underlying rock surface for thousands of square miles (except where postglacial stream erosion has locally laid it bare), and present an extraordinarily even surface. The till is presumably made in part of preglacial soils, but it is more largely composed of rock waste mechanically comminuted by the creeping ice sheets; although the crystalline rocks from Canada and some of the more resistant stratified rocks south of the Great Lakes occur as boulders and stones, a great part of the till has been crushed and ground to a clayey texture. The till plains, although sweeping in broad swells of slowly changing altitude, are often level to the eye, and the view across them stretches to the horizon, unless interrupted by groves of trees along the watercourses, or by belts of low morainic hills. Here and there faint depressions occur, occupied by marshy "sloughs," or floored with a rich black soil of postglacial origin. It is thus by sub-glacial aggradation that the prairies have been levelled up to a smooth surface, in contrast to the higher and non-glaciated hilly country next south.

The great ice sheets formed terminal moraines around their border at various halting stages; but the morainic belts are of small relief in comparison to the great area of the ice; they rise gently from the till plains to a height of 50, 100 or more feet; they may be one, two or three miles wide; and their hilly surface, dotted over with boulders, contains many small lakes in basins or hollows, instead of streams in valleys. The morainic belts are arranged in groups of concentric loops, convex southward, because the ice sheets advanced in lobes along the lowlands of the Great Lakes; neighbouring morainic loops join each other in re-entrants (north-pointing cusps), where two adjacent glacial lobes came together and formed their moraines in largest volume. The discovery of this significant looped arrangement of the morainic belts is the greatest advance in interpretation of glacial phenomena since the first suggestion of a glacial period; it is also the strongest proof that the ice here concerned was a continuous sheet of creeping land ice, and not a discontinuous series of floating icebergs, as had been supposed. The moraines are of too small relief to be shown on any maps but those of the largest scale; yet small as they are, they are the chief relief of the prairie states, and, in association with the nearly imperceptible slopes of the till plains, they determine the course of many streams and rivers, which as a whole are consequent upon the surface form of the glacial deposits.

The complexity of the glacial period and its subdivision into several glacial epochs, separated by interglacial epochs of considerable length (certainly longer than the postglacial epoch) has a structural consequence in the superposition of successive till sheets, alternating with non-glacial deposits, and also a physiographic consequence in the very different amount of normal postglacial erosion suffered by the different parts of the glacial deposits. The southernmost drift sheets, as in southern Iowa and northern Missouri, have lost their initially plain surface and are now maturely dissected into gracefully rolling forms; here the valleys of even the small streams are well opened and graded, and marshes and lakes are wanting: hence these sheets are of early Pleistocene origin. Nearer the Great Lakes the till sheets are trenched only by the narrow valleys of the large streams; marshy sloughs still occupy the faint depressions in the till plains, and the associated moraines have abundant small lakes in their undrained hollows: hence these drift sheets are of late Pleistocene origin.

When the ice sheets fronted on land sloping southward to the Ohio, Mississippi and Missouri rivers, the drift-laden streams flowed freely away from the ice border; and as the streams, escaping from their subglacial channels, spread in broader channels, they ordinarily could not carry forward all their load; hence they acted not as destructive but as constructive agents, and aggraded their courses. Thus local sheets or "aprons" of gravel and sand are spread more or less abundantly along the outer side of the morainic belts; and long trains of gravel and sands clog the valleys that lead southward from the glaciated to the non-glaciated area. Later when the ice retreated farther and the unloaded streams returned to their earlier degrading habit, they more or less completely scoured out the valley deposits, the remains of which are now seen in terraces on either side of the present flood plains.

When the ice of the last glacial epoch had retreated so far that its front lay on a northward slope, belonging to the drainage area of the Great Lakes, bodies of water accumulated in front of the ice margin, forming glacio-marginal lakes. The lakes were small at first, and each had its own outlet at the lowest depression in the height of land to the south; but as the ice melted back, neighbouring lakes became confluent at the level of the lowest outlet of the group; the outflowing streams grew in the same proportion and eroded a broad channel across the height of land and far down stream, while the lake waters built sand reefs or carved shore cliffs along their margin, and laid down sheets of clay on their floors. All of these features are easily recognized in the prairie region. The present site of Chicago was determined by an Indian *portage* or "carry" across the low divide between Lake Michigan and the headwaters of the Illinois river; and this divide lies on the floor of the former outlet channel of the glacial Lake Michigan. Corresponding outlets are known for the glacial lakes Erie, Huron and Superior, and for a very large sheet of water, named Lake Agassiz, which once overspread a broad till plain in northern Minnesota and North Dakota. The outlet of this glacial lake, called river Warren, eroded a large channel in which the Minnesota river of to-day is an evident "misfit."

Certain extraordinary features were produced when the retreat of the ice sheet had progressed so far as to open an eastward outlet for the marginal lakes along the depression between the northward slope of the Appalachian plateau in west-central New York and the southward slope of the melting ice sheet; for when this eastward outlet came to be lower than the south-westward outlet across the height of land to the Ohio or Mississippi river, the discharge of the marginal lakes was changed from the Mississippi system to the Hudson system. Many well-defined channels, cutting across the north-sloping spurs of the plateau in the neighbourhood of Syracuse, N.Y., mark the temporary paths of the ice-bordered outlet river. Successive channels are found at lower and lower levels on the plateau slope, thus indicating the successive courses taken by the lake outlet as the ice melted farther and farther back. On some of these channels deep gorges were eroded heading in temporary cataracts which exceeded Niagara in height but not in breadth; the pools excavated by the plunging waters at the head of the gorges are now occupied by little lakes. The most significant stage in this series of changes occurred when the glacio-marginal lake waters were lowered so that the long cuesta of Niagara limestone was laid bare in western New York; the previously confluent waters were then divided into two lakes; the higher one, Erie, supplying the outflowing Niagara river, which poured its waters down the escarpment of the cuesta to the lower lake, Ontario, whose outlet for a time ran down the Mohawk Valley to the Hudson: thus Niagara falls began. (See NIAGARA.)

Many additional features associated with the glacial period might be described, but space can be given to four only. In certain districts the subglacial till was not spread out in a smooth plain, but accumulated in elliptical mounds, 100 or 200 ft. high, half a mile or a mile long, with axes parallel to the direction of the ice motion as indicated by striae on the underlying rock floor; these hills are known by the Irish name, drumlins, used for similar hills in north-western Ireland. The most remarkable groups of drumlins occur in western New York, where their number is estimated at over 6000, and in southern Wisconsin, where it is placed at 5000. They completely dominate the topography of their districts.

A curious deposit of an impalpably fine and unstratified silt, known by the German name *loess*, lies on the older drift sheets near the larger river courses of the upper Mississippi basin. It attains a thickness of 20 ft. or more near the rivers and gradually fades away at a distance of ten or more miles on either side. It is of inexhaustible fertility, being in this as well as in other respects closely like the loess in China and other parts of Asia, as well as in Germany. It contains land shells, and hence cannot be attributed to marine or lacustrine submergence. The best explanation suggested for loess is that, during certain phases of the glacial period, it was carried as dust by the winds from the flood plains of aggrading rivers, and slowly deposited on the neighbouring grass-covered plains.

South-western Wisconsin and parts of the adjacent states of Illinois, Iowa and Minnesota are known as the "driftless area," because, although bordered by drift sheets and moraines, it is free from glacial deposits. It must therefore have been a sort of oasis, when the ice sheets from the north advanced past it on the east and west and joined around its southern border. The reason for this exemption from glaciation is the converse of that for the southward convexity of the morainic loops; for while they mark the paths of greatest glacial advance along lowland troughs (lake basins), the driftless area is a district protected from ice invasion by reason of the obstruction which the highlands of northern Wisconsin and Michigan (part of the Superior oldland) offered to glacial advance.

The course of the upper Mississippi river is largely consequent upon glacial deposits. Its sources are in the morainic lakes in northern Minnesota; Lake Itasca being only one of many glacial lakes which supply the headwater branches of the great river. The drift deposits thereabouts are so heavy that the present divides between the drainage basins of Hudson Bay, Lake Superior and the Gulf of Mexico evidently stand in no very definite relation to the preglacial divides. The course of the Mississippi through Minnesota is largely guided by the form of the drift cover. Several rapids and the Falls of St Anthony (determining the site of Minneapolis) are signs of immaturity, resulting from superposition through the drift on the under rock. Farther south, as far as the entrance of the Ohio, the Mississippi follows a rock-walled valley 300 to 400 ft. deep, with a flood-plain 2 to 4 m. wide; this valley seems to represent the path of an enlarged early-glacial Mississippi, when much precipitation that is to-day discharged to Hudson Bay and the Gulf of St Lawrence was delivered to the Gulf of Mexico, for the curves of the present river are of distinctly smaller radius than the curves of the valley. Lake Pepin (30 m. below St Paul), a picturesque expansion of the river across its flood-plain, is due to the aggradation of the valley floor where the Chippewa river, coming from the north-east, brought an overload of fluvio-glacial drift. Hence even the "father of waters," like so many other rivers in the Northern states, owes many of its features more or less directly to glacial action.

The fertility of the prairies is a natural consequence of their origin. During the mechanical comminution of the till no vegetation was present to remove the minerals essential to plant growth, as is the case in the soils of normally weathered and dissected peneplains, such as the Appalachian piedmont, where the soils, though not exhausted by the primeval forest cover, are by no means so rich as the till sheets of the prairies. Moreover, whatever the rocky understructure, the till soil has been averaged by a thorough mechanical mixture of rock grindings; hence the prairies are continuously fertile for scores of miles together.

The true prairies, when first explored, were covered with a rich growth of natural grass and annual flowering plants. To-day they are covered with farms. The cause of the treelessness has been much discussed. It does not seem to lie in peculiarities of temperature or of precipitation; for trees thrive where they are properly planted on the prairies; every town and farm to-day has its avenues and groves of trees; but it should be noted that west of the Mississippi river increasing aridity becomes an important factor, and is the chief cause of the treelessness of the Great Plains (see below). The treelessness of the prairies cannot be due to insufficient time for tree invasion since glacial evacuation; for forests cover the rocky uplands of Canada, which were occupied by ice for ages after the prairies were laid bare. A more probable cause is found in the fineness of the prairie soil, which is inimical to the growth of young trees in competition with the grasses and annual plants. Prairie fires, both of natural and artificial origin, are also a contributive cause; for young trees are exterminated by fires, but annual plants soon reappear.

The Gulf Coastal Plain.—The westward extension of the Atlantic coastal plain around the Gulf of Mexico carries with it a repetition of certain features already described, and the addition of several new ones. As in the Atlantic coastal plain, it is only the lower, seaward part of this region that deserves the name of plain, for there alone is the surface unbroken by hills or valleys; the inner part, initially a plain by reason of its essentially horizontal (gently seaward-sloping) structure, has been converted by mature dissection into an elaborate complex of hills and valleys, usually of increasing altitude and relief as one passes inland.

The special features of the Gulf Plain are the peninsular extension of the plain in Florida, the belted arrangement of relief and soils in Alabama and in Texas, and the Mississippi embayment or inland extension of the plain half-way up the course of the Mississippi river, with the Mississippi flood plain there included.

Florida. A broad, low crustal arch extends southward at the junction of the Atlantic and Gulf coastal plains; the emerged half of the arch constitutes the visible lowland peninsula of Florida; the submerged half extends westward under the shallow overlapping waters of the Gulf of Mexico. The northern part of the peninsula is composed largely of a weak limestone; here much of the lowland drainage is underground, forming many sink-holes (swallow-holes). Many small lakes in the lowland appear to owe their basins to the solution of the limestones. Valuable phosphate deposits occur in certain districts. The southern part of the state includes the "Everglades" (*q.v.*), a large area of low, flat, marshy land, overgrown with tall reedy grass, a veritable wilderness; thus giving Florida an unenvied first rank among the states in marsh area. The eastern coast is fringed by long-stretching sand reefs, enclosing lagoons so narrow and continuous that they are popularly called "rivers." At the southern end of the peninsula is a series of coral islands, known as "keys"; they appear to be due to the forward growth of corals and other lime-secreting organisms towards the strong current of the Gulf Stream, by which their food is supplied: the part of the peninsula composed of coral reefs is less than has been formerly supposed. The western coast has fewer and shorter off-shore reefs; much of it is of minutely irregular outline, which seems to be determined less by the work of the sea than by the forward growth of mangrove swamps in the shallow salt water.

Alabama. A typical example of a belted coastal plain is found in Alabama and the adjacent part of Mississippi. The plain is here about 150 m. wide. The basal formation is chiefly a weak limestone, which has been stripped from its original innermost extension and worn down to a flat inner lowland of rich black soil, thus gaining the name of the "black belt." The lowland is enclosed by an upland or cuesta, known as Chunnenugga Ridge, sustained by partly consolidated sandy strata; the upland, however, is not continuous, and hence should be described as a "maturely dissected cuesta." It has a relatively rapid descent toward the inner lowland, and a very gradual descent to the coast prairies, which become very low, flat and marshy before dipping under the Gulf waters, where they are generally fringed by off-shore reefs.

The coastal plain extends 500 m. inland on the axis of the Mississippi embayment. Its inner border affords admirable examples of topographical discordance where it sweeps north-westward square across the trend of the piedmont belt, the ridges and valleys, and the plateau of the Appalachians, which are all terminated by dipping gently beneath the unconformable cover of the coastal plain strata. In the same way the western side of the embayment, trending south and south-west, passes along the lower south-eastern side of the dissected Ozark plateau of southern Missouri and northern Arkansas, which in many ways resembles the Appalachian plateau, and along the eastern end of the Massern ranges of the Ouachita mountain system in central Arkansas, which in geological history and topographical form present many analogies with the ridges and valleys of the Appalachians; and as the coastal plain turns westward to Texas it borders the Arbuckle hills in Oklahoma, a small analogue of the crystalline Appalachian belt. In the embayment of the coastal plain some low cuesta-like belts of hills with associated strips of lowlands suggest the features of a belted coastal plain; the hilly belt or dissected cuesta determined by the Grand Gulf formation in western Mississippi is the most distinct. Important salt deposits occur in the coastal plain strata near the coast. The most striking feature of the embayment is the broad valley which the Mississippi has eroded across it.

The Mississippi Embayment.

The lower Mississippi is the trunk in which three large rivers join; the chief figures (approximate only) regarding them are as follows:—

	Drainage Area (square miles).	Percentage of Total Discharge.
Upper Mississippi . . .	170,000	18
Ohio	210,000	31
Missouri	530,000	14

The small proportion of total water volume supplied from the great Missouri basin is due to the light precipitation in that region. The lower Mississippi receives no large tributary from the east, but two important ones come from the west; the Arkansas drainage area being a little less than that of the Ohio, and the basin of the Red River of Louisiana being about half as large. The great river thus constituted drains an area of about 1,250,000 sq. m., or about one-third of the United States; and discharges 75,000 cub. yds. of water per second, or 785,190,000,000 cubic yds. per annum, which corresponds roughly to one quarter of the total precipitation on its drainage basin. Its load of land waste (see I. C. Russell, *Rivers of North America*) is as follows:—

The Lower Mississippi River.

In suspension . .	6,718,694,400	cub. ft.	or 241	ft.	deep over	1	sq. m.
Swept along bottom	750,000,000	„	„ 26	„	„	1	„
In solution . . .	1,350,000,000	„	„ 45	„	„	1	„

Average annual removal of waste from entire basin, $\frac{1}{350}$ in. or 1 ft. in 4000 years.

The head of the coastal plain embayment is near the junction of the Ohio and the Mississippi. Thence southward for 560 m. the great river flows through the semi-consolidated strata of the plain, in which it has eroded a valley, 40 or 50 m. wide, and 29,700 sq. m. in area, enclosed by bluffs one or two hundred feet high in the northern part, generally decreasing to the southward, but with local increase of height associated with a decrease in flood plain breadth on the eastern side where the Grand Gulf cuesta is traversed. This valley in the coastal plain, with the much narrower rock-walled valley of the upper river in the prairie states, is the true valley of the Mississippi river; but in popular phrase the "Mississippi Valley" is taken to include a large central part of the Mississippi drainage basin. The valley floor is covered with a flood plain of fine silt, having a southward slope of only half a foot to a mile. The length of the river itself, from the Ohio mouth to the Gulf, is, owing to its windings, about 1060 m.; its mean fall is about 3 in. in a mile. On account of the rapid deposition of sediment near the main channel at times of overflow, the flood plain, as is normally the case on mature valley floors, has a lateral slope of as much as 5, 10, or even 12 ft. in the first mile from the river; but this soon decreases to a less amount. Hence at a short distance from the river the flood plain is often swampy, unless its surface is there aggraded by the tributary streams: for this reason Louisiana, Arkansas and Mississippi rank next after Florida in swamp area.

The great river receives an abundant load of silt from its tributaries, and takes up and lays down silt from its own bed and banks with every change of velocity. The swiftest current tends, by reason of centrifugal force, to follow the outer side of every significant curve in the channel; hence the concave bank, against which the rapid current sweeps, is worn away; thus any chance irregularity is exaggerated, and in time a series of large serpentines or meanders is developed, the most symmetrical examples at present being those near Greenville, Miss. The growth of the meanders tends to give the river continually increasing length; but this tendency is counteracted by the sudden occurrence of cut-offs from time to time, so that a fairly constant length is maintained.

The floods of the Mississippi usually occur in spring or summer. Owing to the great size of the drainage basin, it seldom happens that the three upper tributaries are in flood at the same time; the coincident occurrence of floods in only two tributaries is of serious import in the lower river, which rises 30, 40, or occasionally 50 ft. The abundant records by the Mississippi River Commission and the United States Weather Bureau (by which accurate and extremely useful predictions of floods in the lower river course are made, on the basis of the observed rise in the tributaries) demonstrate a number of interesting features, of which the chief are as follows: the fall of the river is significantly steepened and its velocity is accelerated down stream from the point of highest rise; conversely, the fall and the velocity are both diminished up stream from the same point.

The load of silt borne down stream by the river finally, after many halts on the way, reaches the waters of the Gulf, where the decrease of velocity, aided by the salinity of the sea water, causes the formation of a remarkable delta, leaving less aggraded areas as shallow lakes (Lake Pontchartrain on the east, and Grand Lake on the west of the river). The ordinary triangular form of deltas, due to the smoothing of the delta front by sea action, is here wanting, because of the weakness of sea action in comparison with the strength of the current in each of the four distributaries or "passes" into which the river divides near its mouth. (See MISSISSIPPI RIVER.)

After constriction from the Mississippi embayment to 250 m. in western Louisiana, the coastal plain continues south-westward with this breadth until it narrows to about 130 m. in southern Texas near the crossing of the Colorado river, (of Texas); but it again widens to 300 m. at the national boundary as a joint effect of embayment up the valley of the Rio Grande and of the seaward advance of this river's rounded delta front: these several changes take place in a distance of about 500 m., and hence include a region of over 100,000 sq. m.—less than half of the large state of Texas. A belted arrangement of reliefs and soils, resulting from differential erosion on strata of unlike composition and resistance, characterizes almost the entire area of the coastal plain. Most of the plain is treeless prairie, but the sandier belts are forested; two of them are known as "cross timbers," because their trend is transverse to the general course of the main consequent rivers. An inland extension from the coastal plain in north-central Texas leads to a large cuesta known as Grand Prairie (not structurally included in the coastal plain), upheld at altitudes of 1200 or 1300 ft. by a resistant Cretaceous limestone, which dips gently seaward; its scalloped inland-facing escarpment overlooks a denuded central prairie region of irregular structure and form; its gentle coastward slope (16 ft. to a mile) is dissected by many branching consequent streams; in its southern part, as it approaches the Colorado river the cuesta is dissected into a belt of discontinuous hills. The western cross timbers follow a sandy belt along the inner base of the ragged escarpment of Grand Prairie; the eastern cross timbers follow another sandy belt in the lowland between the eastern slope of Grand Prairie and the pale western escarpment of the next eastward and lower Black Prairie cuesta. This cuesta is supported at an altitude of 700 ft. or less by a chalk formation, which gives an infacing slope some 200 ft. in height, while its gently undulating or "rolling" seaward slope (2 or 3 ft. in a mile), covered with marly strata and rich black soil, determines an important cotton district. Then comes the East Texas timber belt, broad in the north-east, narrowing to a point before reaching the Rio Grande, a low and thoroughly dissected cuesta of sandy Eocene strata; and this is followed by the Coast Prairie, a very young plain, with a seaward slope of less than 2 ft. in a mile, its smooth surface interrupted only by the still more nearly level flood plains of the shallow, consequent river valleys. Near the Colorado river the dissected cuesta of the Grand Prairie passes southward, by a change to a more nearly horizontal structure, into the dissected Edwards plateau (to be referred to again as part of the Great Plains), which terminates in a maturely dissected fault scarp, 300 or 400 ft. in height, the northern boundary of the Rio Grande embayment. From the Colorado to the Rio Grande, the Black Prairie, the timber belt and the Coast Prairie merge in a vast plain, little differentiated, overgrown with "chaparral" (shrub-like trees, often thorny), widening eastward in the Rio Grande delta, and extending southward into Mexico.

The Texas Coastal Plain.

Although the Coast Prairie is a sea bottom of very modern uplift, it appears already to have suffered a slight movement of depression, for its small rivers all enter embayments; the larger rivers, however, seem to have counteracted the encroachment of the sea on the land by a sufficiently active delta building, with a resulting forward growth of the land into the sea. The Mississippi has already been mentioned as rapidly building forward its digitate delta; the Rio Grande, next in size, has built its delta about 50 m. forward from the general coast-line, but this river being much smaller than the Mississippi, its delta front is rounded by seashore agencies. In front of the Brazos and the Colorado, the largest of the Texan rivers, the coast-line is very gently bowed forward, as if by delta growth, and the sea touches the mainland in a nearly straight shore line. Nearly all the rest of the coast is fringed by off-shore reefs, built up by waves from the very shallow sea bottom; in virtue of weak tides, the reefs continue in long unbroken stretches between the few inlets.

The Great Plains.—A broad stretch of country underlaid by nearly horizontal strata extends westward from the 97th meridian to the base of the Rocky Mountains, a distance of from 300 to 500 m., and northward from the Mexican boundary far into Canada. This is the province of the Great Plains. Although the altitude of plains increases gradually from 600 or 1200 ft. on the east to 4000, 5000 or 6000 ft. near the mountains, the local relief is generally small; the sub-arid climate excludes tree growth and opens far-reaching views. The plains are by no means a simple unit; they are of diverse structure and of various stages of erosional development; they are occasionally interrupted by buttes and escarpments; they are frequently broken by valleys: yet on the whole a broadly extended surface of moderate relief so often prevails that the name, Great Plains, for the region as a whole is well deserved. The western boundary of the plains is usually well defined by the abrupt ascent of the mountains. The eastern boundary of the plains is more climatic than topographic. The line of 20 in. of annual rainfall trends a little east of northward near the 97th meridian, and if a boundary must be drawn where nature presents only a gradual transition, this rainfall line may be taken to divide the drier plains from the moister prairies. The plains may be described in northern, intermediate, central and southern sections, in relation to certain peculiar features.

The northern section of the Great Plains, north of latitude 44°, including eastern Montana, north-eastern Wyoming and most of the Dakotas, is a moderately dissected peneplain, one of the best examples of its class. The strata here are Cretaceous or early Tertiary, lying nearly horizontal. The surface is shown to be a plain of degradation by a gradual ascent here and there to the crest of a ragged escarpment, the cuesta-remnant of a resistant stratum; and by the presence of lava-capped mesas and dike-ridges, surmounting the general level by 500 ft. or more and manifestly demonstrating the widespread erosion of the surrounding plains. All these reliefs are more plentiful towards the mountains in central Montana. The peneplain is no longer in the cycle of erosion that witnessed its production; it appears to have suffered a regional elevation, for the rivers—the upper Missouri and its branches—no longer flow on the surface of the plain, but in well graded, maturely opened valleys, several hundred feet below the general level. A significant exception to the rule of mature valleys occurs, however, in the case of the Missouri, the largest river, which is broken by several falls on hard sandstones about 50 m. east of the mountains. This peculiar feature is explained as the result of displacement of the river from a better graded preglacial valley by the Pleistocene ice-sheet, which here overspread the plains from the moderately elevated Canadian highlands far on the north-east, instead of from the much higher mountains near by on the west. The present altitude of the plains near the mountain base is 4000 ft.

The northern plains are interrupted by several small mountain areas. The Black Hills, chiefly in western South Dakota, are the largest group: they rise like a large island from the sea, occupying an oval area of about 100 m. north-south by 50 m. east-west, reaching an altitude in Harney Peak of 7216 ft., and an effective relief over the plains of 2000 or 3000 ft. This mountain mass is of flat-arched, dome-like structure, now well dissected by radiating consequent streams, so that the weaker uppermost strata have been eroded down to the level of the plains where their upturned edges are evenly truncated, and the next following harder strata have been sufficiently eroded to disclose the core of underlying crystalline rocks in about half of the domed area.

In the intermediate section of the plains, between latitudes 44° and 42°, including southern South Dakota and northern Nebraska, the erosion of certain large districts is peculiarly elaborate, giving rise to a minutely dissected form, known as "bad lands," with a relief of a few hundred feet. This is due to several causes: first, the dry climate, which prevents the growth of a grassy turf; next, the fine texture of the Tertiary strata in the bad land districts; and consequently the success with which every little rill, at times of rain, carves its own little valley. Travel across the bad lands is very fatiguing because of the many small ascents and descents; and it is from this that their name, "mauvaises terres pour traverser," was given by the early French *voyageurs*.

The central section of the Great Plains, between latitudes 42° and 36°, occupying eastern Colorado and western Kansas, is, briefly stated, for the most part a dissected fluviatile plain; that is, this section was once smoothly covered with a gently sloping plain of gravel and sand that had been spread far forward on a broad denuded area as a piedmont deposit by the rivers which issued from the mountains; and since then it has been more or less dissected by the erosion of valleys. The central section of the plains thus presents a marked contrast to the northern section; for while the northern section owes its smoothness to the removal of local gravels and sands from a formerly uneven surface by the action of degrading rivers and their inflowing tributaries, the southern section owes its smoothness to the deposition of imported gravels and sands upon a previously uneven surface by the action of aggrading rivers and their outgoing distributaries. The two sections are also unlike in that residual eminences still here and there surmount the peneplain of the northern section, while the fluviatile plain of the central section completely buried the pre-existent relief. Exception to this statement must be made in the south-west, close to the mountains in southern Colorado, where some lava-capped mesas (Mesa de Maya, Raton Mesa) stand several thousand feet above the general plain level, and thus testify to the widespread erosion of this region before it was aggraded.

The southern section of the Great Plains, between latitudes 35½° and 29½°, lies in eastern Texas and eastern New Mexico; like the central section it is for the most part a dissected fluviatile plain, but the lower lands which surround it on all sides place it in so strong relief that it stands up as a table-land, known from the time of Mexican occupation as the Llano Estacado. It measures roughly 150 m. east-west and 400 m. north-south, but it is of very irregular outline, narrowing to the south. Its altitude is 5500 ft. at the highest western point, nearest the mountains whence its gravels were supplied; and thence it slopes south-eastward at a decreasing rate, first about 12 ft., then about 7 ft. in a mile, to its eastern and southern borders, where it is 2000 ft. in altitude: like the High Plains farther north, it is extraordinarily smooth; it is very dry, except for occasional shallow and temporary water sheets after rains. The Llano is separated from the plains on the north by the mature consequent valley of the Canadian river, and from the mountains on the west by the broad and probably mature valley of the Pecos river. On the east it is strongly undercut by the retrogressive erosion of the headwaters of the Red, Brazos and Colorado rivers of Texas, and presents a ragged escarpment, 500 to 800 ft. high, overlooking the central denuded area of that state; and there, between the Brazos and Colorado rivers, occurs a series of isolated outliers capped by a limestone which underlies both the Llano on the west and the Grand Prairies cuesta on the east. The southern and narrow part of the table-land, called the Edwards Plateau, is more dissected than the rest, and falls off to the south in a frayed-out fault scarp, as already mentioned, overlooking the coastal plain of the Rio Grande embayment. The central denuded area, east of the Llano, resembles the east-central section of the plains in exposing older rocks; between these two similar areas, in the space limited by the Canadian and Red rivers, rise the subdued forms of the Wichita Mountains in Oklahoma, the westernmost member of the Ouachita system.

The Cordilleran Region.—From the western border of the Great Plains to the Pacific coast, there is a vast elevated area, occupied by mountains, plateaus and intermont plains. The intermont plains are at all altitudes from sea-level to 4000 ft.; the plateaus from 5000 to 10,000 ft.; and the mountains from 8000 to 14,000 ft. The higher mountains are barren from the cold of altitude; the timber line in Colorado stands at 11,000 to 12,000 ft.

The chief provinces of the Cordilleran region are: The Rocky Mountain system and its basins, from northern New Mexico northward, including all the mountains from the front ranges bordering on the plains to the Uinta and Wasatch ranges in Utah; the Pacific ranges including the Sierra Nevada of California, the Cascade range of Oregon and Washington, and the Coast range along the Pacific nearly to the southern end of California; and a great intermediate area, including in the north the Columbian lava plains and in the south the large province of the Basin ranges, which extends into Mexico and widens from the centre southward, so as to meet the Great Plains in eastern New Mexico, and to extend to the Pacific coast in southern California. There is also a province of plateaus between the central part of the Basin ranges and the southern part of the Rocky Mountains. An important geological characteristic of most of the Cordilleran region is that the Carboniferous strata, which in western Europe and the eastern United States contain many coal seams, are represented in the western United States by a marine limestone; and that the important unconformity which in Europe and the eastern United States separates the Palaeozoic and Mesozoic eras does not occur in the western United States, where the formations over a great area follow in conformable sequence from early Palaeozoic through the Mesozoic.

The Rocky Mountains.

The Rocky Mountains begin in northern Mexico, where the axial crystalline rocks rise to 12,000 ft. between the horizontal structures of the plains on the east and the plateaus on the west. The upturned stratified formations wrap around the flanks of the range, with ridges and valleys formed on their eroded edges and drained southward by the Pecos river to the Rio Grande and the Gulf of Mexico. The mountains rapidly grow wider and higher northward, by taking on new complications of structure and by including large basins between the axes of uplift, until in northern Colorado and Utah a complex of ranges has a breadth of 300 m., and in Colorado alone there are 40 summits over 14,000 ft. in altitude, though none rises to 14,500. Then turning more to the north-west through Wyoming, the ranges decrease in breadth and height; in Montana their breadth is not more than 150 m., and only seven summits exceed 11,000 ft. (one reaching 12,834).

As far north as the gorge of the Missouri river in Montana, the Front range, facing the Great Plains, is a rather simple uplift, usually formed by upturning the flanking strata, less often by a fracture. Along the eastern side of the Front Range in Colorado most of the upturned stratified formations have been so well worn down that, except for a few low piedmont ridges, their even surface may now be included with that of the plains, and the crystalline core of the range is exposed almost to the mountain base. Here the streams that drain the higher areas descend to the plains through narrow canyons in the mountain border, impassable for ordinary roads and difficult of entrance even by railways; a well-known example is the gorge of Clear Creek east of the Georgetown mining district. The crystalline highlands thereabouts, at altitudes of 8000 to 10,000 ft., are of so moderate a relief as to suggest that the mass had stood much lower in a former cycle of erosion and had then been worn down to rounded hills; and that since uplift to the present altitude the revived streams of the current cycle of erosion have not entrenched themselves deep enough to develop strong relief. This idea is confirmed 80 m. farther south, where Pike's Peak (14,108 ft.), a conspicuous landmark far out on the plains, has every appearance of being a huge monadnock, surmounting a rough peneplain of 10,000 ft. in general elevation. The idea is still better confirmed farther north in Wyoming, where the Laramie Range, flanked with upturned strata on the east and west, is for the most part a broad upland at altitudes of 7000 or 8000 ft., with no strong surmounting summits and as yet no deep carved valleys. Here the first of the Pacific railways chose its pass. When the summit is reached, the traveller is tempted to ask, "Where are the mountains?" so small is the relief of the upland surface. This low range turns westward in a curve through the Rattlesnake Mountains towards the high Wind River Mountains (Gannett Peak, 13,775 ft.), an anticlinal range within the body of the mountain system, with flanking strata rising well on the slopes. Flanking strata are even better exhibited in the Bighorn Mountains, the front range of northern Wyoming, crescentic in outline and convex to the north-east, like the Laramie Range, but much higher; here heavy sheets of limestone arch far up towards the range crest, and are deeply notched where consequent streams have cut down their gorges.

Farther north in Montana, beyond the gorge of the Missouri river, the structure of the Front Range is altogether different; it is here the carved residual of a great mass of moderately bent Palaeozoic strata, overthrust eastward upon the Mesozoic strata of the plains; instead of exposing the oldest rocks along the axis and the youngest rocks low down on the flanks, the younger rocks of the northern range follow its axis, and the oldest rocks outcrop along its eastern flanks, where they override the much younger strata of the plains; the harder strata, instead of lapping on the mountain flanks in great slab-like masses, as in the Bighorns, form out-facing scarps, which retreat into the mountain interior where they are cut down by outflowing streams.

The structure of the inner ranges is so variable as to elude simple description; but mention should be made of the Uinta range of broad anticlinal structure in north-east Utah, with east-west trend, as if corresponding to the east-west Rattlesnake Mountains, already named. The Wasatch Range, trending north-south in central Utah, is peculiar in possessing large east-west folds, which are seen in cross-section in the dissected western face of the range, because the whole mass is there squarely cut off by a great north-south fault with down-throw to the Basin Range province, the fault face being elaborately carved.

Volcanic action has been restricted in the Rocky Mountains proper. West Spanish Peak (13,620 ft.), in the Front Range of southern Colorado, may be mentioned as a fine example of a deeply dissected volcano, originally of greater height, with many unusually strong radiating dike-ridges near its denuded flanks. In north-western Wyoming there are extensive and heavy lava sheets, uplifted and dissected, and crowned with a few dissected volcanoes. It is in association with this field of extinct volcanic activity that a remarkable group of geysers and hot springs has been developed, from which the Yellowstone river, a branch of the Missouri, flows north-eastward, and the Snake river, a branch of the Columbia, flows south-westward. The geyser district is held as a national domain, the Yellowstone Park.

Travellers whose idea of picturesqueness is based upon the abnormally sharpened peaks of the ice-sculptured Alps are disappointed with the scenery of the central and southern ranges of the Rocky Mountains. It is true that many of these ranges are characterized by the rounded tops and the rather evenly slanting, waste-covered slopes which normally result from the long-continued action of the ordinary agencies of erosion; that they bear little snow in summer and are practically wanting in glaciers; that forests are often scanty on the middle and lower slopes, the more so because of devastation by fires; and that the general impression of great altitude is much weakened because the mountains are seen from a base which itself is 5000 or 6000 ft. above sea-level. Nevertheless the mountains are of especial interest to the physiographer who wishes to make a comparative study of land forms as affected by normal and by glacial sculpture, in order to give due attention to "process" as well as to "structure and stage" in the analysis and description of mountain topography. A journey along the range from south to north reveals most strikingly a gradual increase in the share of sculpture due to Pleistocene glaciers. In New Mexico, if glaciers were formed at all in the high valleys, they were so small as not greatly to modify the more normal forms. In central Colorado and Wyoming, where the mountains are higher and the Pleistocene glaciers were larger, the valley heads were hollowed out in well-formed cirques, often holding small lakes; and the mountain valleys were enlarged into U-shaped troughs as far down as the ice reached, with hanging lateral valleys on the way. Different stages of cirque development, with accompanying transformation of mountain shape, are finely illustrated in several ranges around the headwaters of the Arkansas river in central Colorado, where the highest summit of the Rocky Mountains is found (Mt Massive, 14,424 ft., in the Sawatch range); and perhaps even better in the Bighorn range of Wyoming. In this central region, however, it is only by way of exception that the cirques were so far enlarged by retrogressive glacial erosion as to sharpen the preglacial dome-like summits into acute peaks; and in no case did glacial action here extend down to the plains at the eastern base of the mountains; but the widened, trough-like glaciated valleys frequently descend to the level of the elevated intermont basins, where moraines were deployed forward on the basin floor. The finest examples of this kind are the moraines about Jackson Lake on the basin floor east of the Teton Range (Grand Teton, 13,747 ft.), a superb north-south range which lies close to the meridional boundary line between Wyoming and Idaho. Farther north in Montana, in spite of a decrease of height, there are to-day a few small glaciers with snowfields of good size; and here the effects of sculpture by the much larger Pleistocene glaciers are seen in forms of almost alpine strength.

The intermont basins which so strongly characterize the Rocky Mountain system are areas which have been less uplifted than the enclosing ranges, and have therefore usually become the depositories of waste from the surrounding mountains.

Some of the most important basins may be mentioned. San Luis "Valley" is an oval basin about 60 m. long near the southern end of the mountain system in New Mexico and Colorado; its level, treeless floor, at an altitude of 7000 ft., is as yet hardly trenched by the Rio Grande, which escapes through an impassable canyon southward on its way to the Gulf of Mexico. The much smaller basin of the upper Arkansas river in Colorado is well known because the Royal Gorge, a very narrow cleft by which the river escapes through the Front Range to the plains, is followed by a railroad at river-level. South Park, directly west of Pike's Peak, is one of the highest basins (nearly 10,000 ft.), and gains its name from the scattered, park-like growth of large pine trees; it is drained chiefly by the South Platte river (Missouri-Mississippi system), through a deep gorge in the dissected mass of the plateau-like Front Range. The Laramie Plains and the Green river basin, essentially a single structural basin between the east-west ranges of Rattlesnake Mountains on the north and the Uinta Range on the south, measuring roughly 260 m. east-west by 100 m. north-south, is the largest intermont basin; it is well known from being traversed through its greatest length by the Union Pacific railway. Its eastern part is drained north-eastward through a gorge that separates the Laramie and Rattlesnake (Front) ranges by the North Platte river to the Missouri-Mississippi; its western part, where the basin floor is much dissected, often assuming a bad-land expression, is drained south-ward by the Green river, through a deep canyon in the Uinta Range to the Colorado river and then to the Pacific. The Bighorn basin has a moderately dissected floor, drained north-eastward by Bighorn river through a deep canyon in the range of the same name to the Missouri. Several smaller basins occur in Montana, all somewhat dissected and drained through narrow gorges and canyons by members of the Missouri system.

The Plateau Province.

The Plateau province, next west of the southern Rocky Mountains, is characterized for the most part by large-textured forms, developed on a great thickness of nearly horizontal Palaeozoic, Mesozoic and Tertiary formations, and by a dry climate. The province was uplifted and divided into great blocks by faults or monoclinal flexures and thus exposed to long-lasting denudation in a mid-Tertiary cycle of erosion; and then broadly elevated again, with renewed movement on some of the fault lines; thus was introduced in late Tertiary time the current cycle of erosion in which the deep canyons of the region have been trenched. The results of the first cycle of erosion are seen in the widespread exposure of the resistant Carboniferous limestone as a broad platform in the south-western area of greater uplift through central Arizona, where the higher formations were worn away; and in the development of a series of huge, south-facing, retreating escarpments of irregular outline on the edges of the higher formations farther north. Each escarpment stands forth where a resistant formation overlies a weaker one; each escarpment is separated from the next higher one by a broad step of weaker strata. A wonderful series of these forms occurs in southern Utah, where in passing northward from the Carboniferous platform one ascends in succession the Vermilion Cliffs (Triassic sandstones), the White Cliffs (Jurassic sandstones, of remarkably cross-bedded structure, interpreted the dunes of an ancient desert), and finally the Pink Cliffs (Eocene strata of fluviatile and lacustrine origin) of the high, forested plateaus. Associated with these irregular escarpments are occasional rectilinear ridges, the work of extensive erosion on monoclinal structures, of which Echo Cliffs, east of the Painted Desert (so called from its many-coloured sandstones and clays), is a good example.

With the renewal of uplift by which the earlier cycle of erosion was interrupted and the present cycle introduced, inequalities of surface due to renewed faulting were again introduced; these still appear as cliffs, of more nearly rectilinear front than the retreating escarpments formed in the previous cycle. These cliffs are peculiar in gradually passing from one formation to another, and in having a height dependent on the displacement of the fault rather than on the structures in the fault face; they are already somewhat battered and dissected by erosion. The most important line of cliffs of this class is associated with the western and southern boundary of the plateau province, where it was uplifted from the lower ground. The few rivers of the region must have reached the quiescence of old age in the earlier cycle, but were revived by uplift to a vigorous youth in the current cycle; and it is to this newly introduced cycle of physiographic evolution that the deep canyons of the Plateau province are due. Thus the Virgin river, a northern branch of the Colorado, has cut a vertical slit, 1000 ft. deep, hardly wider at the top than at the bottom, in the heavy Triassic sandstones of southern Utah; but the most famous example is the Grand Canyon (*q.v.*) of Arizona, eroded by the Colorado river across the uplifted platform of Carboniferous limestone.

During the current cycle of erosion, several of the faults, whose scarps had been worn away in the previous cycle, have been brought to light again as topographic features by the removal of the weak strata along one side of the fault line, leaving the harder strata on the other side in relief; such scarps are known as "fault-line scarps," in distinction from the original "fault scarps." They are peculiar in having their altitude dependent on the depth of revived erosion, instead of the amount of faulting, and they are sometimes "topographically reversed," in that the revived scarp overlooks a lowland worn on a weak formation in the upheaved fault-block. Another consequence of revived erosion is seen in the occurrence of great landslides, where the removal of weak (Permian) clays has sapped the face of the Vermilion Cliffs (Triassic sandstone), so that huge slices of the cliff face have slid down and forward a mile or two, all shattered into a confused tumult of forms for a score or more of miles along the cliff base.

Volcanic features occur in abundance in the Plateau province. Some of the high plateaus in the north are capped with remnants of heavy lava flows of early eruption. A group of large volcanoes occurs on the limestone platform south of the Grand Canyon, culminating in Mt San Francisco (12,794 ft.), a moderately dissected cone, and associated with many more recent smaller cones and fresh-looking lava flows. Mt Taylor in western New Mexico is of similar age, but here dissection seems to have advanced farther, probably because of the weaker nature of the underlying rocks, with the result of removing the smaller cones and exposing many lava conduits or pipes in the form of volcanic necks or buttes. The Henry Mountains in south-western Utah are peculiar in owing their relief to the doming or blistering up of the plateau strata by the underground intrusion of large bodies or "cisterns" (laccolites) of lava, now more or less exposed by erosion.

The lava plains of the Columbia basin are among the most extensive volcanic outpourings in the world. They cover 200,000 sq. m. or more in south-eastern Washington, eastern Oregon and south-western Idaho, and are known to be 4000 ft. deep in some river gorges. The lava completely buries the pre-existent land forms over most of its extent. The earlier supposition that these vast lava flows came chiefly from fissure eruptions has been made doubtful by the later discovery of flat-sloping volcanic cones from which much lava seems to have been poured out in a very liquid state. Some of the flows are still so young as to preserve their scoriaceous surface; here the "shore-line" of the lava contours evenly around the spurs and enters, bay-like, into the valleys of the enclosing mountains, occasionally isolating an outlying mass. Other parts of the lava flood are much older and have been more or less deformed and eroded. Thus the uplifted, dislocated and dissected lava sheets of the Yellowstone National Park in the Rocky Mountains on the east (about the headwaters of the Snake river) are associated with the older lavas of the Columbian plains.

The Columbia river has entrenched itself in a canyon-like valley around the northern and western side of the lava plains; Snake river has cut a deeper canyon farther south-east where the plains are higher and has disclosed the many lava sheets which build up the plains, occasionally revealing a buried mountain in which the superposed river has cut an even narrower canyon. One of the most remarkable features of this province is seen in the temporary course taken by the Columbia river across the plains, while its canyon was obstructed by Pleistocene glaciers that came from the Cascade Mountains on the north-west. The river followed the temporary course long enough to erode a deep gorge, known as "Grande Coulee," along part of its length.

The lava plains are treeless and for the most part too dry for agriculture; but they support many cattle and horses. Along parts of their eastern border, where the rainfall is a little increased by the approach of the westerly winds to the Rocky Mountains, there is a belt of very deep, impalpably fine soil, supposed to be a dust deposit brought from the drier parts of the plains farther west; excellent crops of wheat are here raised.

The Basin Range Province.

The large province of the Basin ranges, an arid region throughout, even though it reaches the sea in southern California, involves some novel problems in its description. It is characterized by numerous disconnected mountain ranges trending north and south, from 30 to 100 m. in length, the higher ranges reaching altitudes of 8000 or 10,000 ft., separated by broad, intermont desert plains or basins at altitudes varying from sea-level (or a little less) in the south-west, to 4000 or 5000 ft. farther inland. Many of the intermont plains—these chiefly in the north—appear to be heavily aggraded with mountain waste; while others—these chiefly in the south—are rock-floored and thinly veneered with alluvium. The origin of these forms is still in discussion; but the following interpretation is well supported. The ranges are primarily the result of faulting and uplifting of large blocks of the earth's crust. The structure of the region previous to faulting was dependent on long antecedent processes of accumulation and deformation and the surface of the region then was dependent on the amount of erosion suffered in the prefaulting cycle. When the region was broken into fault blocks and the blocks were uplifted and tilted, the back slope of each block was a part of the previously eroded surface and the face of the block was a surface of fracture; the present form of the higher blocks is more or less affected by erosion since faulting, while many of the lower blocks have been buried under the waste of the higher ones. In the north, where dislocations have invaded the field of the horizontal Columbian lavas, as in south-eastern Oregon and north-eastern California, the blocks are monoclinal in structure as well as in attitude; here the amount of dissection is relatively moderate, for some of the fault faces are described as ravined but not yet deeply dissected; hence these dislocations appear to be of recent date. In western Utah and through most of Nevada many of the blocks exhibit deformed structures, involving folds and faults of relatively ancient (Jurassic) date; so ancient that the mountains then formed by the folding were worn down to the lowland stage of old age before the block-faulting occurred. When this old-mountain lowland was broken into blocks and the blocks were tilted, their attitude, but not their structure, was monoclinal; and in this new attitude they have been so maturely re-dissected in the new cycle of erosion upon which they have now entered as to have gained elaborately carved forms in which the initial form of the uplifted blocks can hardly be perceived; yet at least some of them still retain along one side the highly significant feature of a relatively simple base-line, transecting hard and soft structures alike, and thus indicating the faulted margin of a tilted block. Here the less uplifted blocks are now heavily aggraded with waste from the dissected ranges: the waste takes the form of huge alluvial fans, formed chiefly by occasional boulder-bearing floods from the mountains; each fan heads in a ravine at the mountain base, and becomes laterally confluent with adjacent fans as it stretches several miles forward with decreasing slope and increasing fineness of material.

In the southern part of the Basin Range province the ranges are well dissected and some of the intermont depressions have rock floors with gentle, centripetal slopes; hence it is suggested that the time since the last dislocation in this part of the province is relatively remote; that erosion in the current cycle has here advanced much farther than in the central or northern parts of the province; and that, either by outwash to the sea or by exportation of wind-borne dust, the depressions—perhaps aggraded for a time in the earlier stages of the cycle—have now been so deeply worn down as to degrade the lower and weaker parts of the tilted blocks to an evenly sloping surface, leaving the higher and harder parts still in relief as residual ranges. If this be true, the southern district will furnish a good illustration of an advanced stage of the cycle of arid erosion, in which the exportation of waste from enclosed depressions by the wind has played an important part. In such case the washing of the centripetal slopes of the depressions by occasional "sheet-floods" (widespreading sheets of turbid running water, supplied by heavy short-lived rains) has been efficient in keeping the rock floor at even grade toward a central basin, where the finest waste is collected while waiting to be removed by the winds.

Only a small part of the Basin Range province is drained to the sea. A few intermont areas in the north-west part of the province have outlet westward by Klamath river through the Cascade range and by Pitt river (upper part of the Sacramento) through the Sierra Nevada: a few basins in the south-east have outlet by the Rio Grande to the Gulf of Mexico; a much larger but still narrow medial area is drained south-westward by the Colorado to the head of the Gulf of California, where this large and very turbid river has formed an extensive delta, north of which the former head of the gulf is now cut off from the sea and laid bare by evaporation as a plain below sea-level. It is here that an irrigation project, involving the diversion of some of the river water to the low plain, led to disaster in 1904, when the flooded river washed away the canal gates at the intake and overflowed the plain, drowning the newly established farms, compelling a railway to shift its track, and forming a lake (Salton Sea) which would require years of evaporation to remove (see COLORADO RIVER). Many streams descend from the ravines only to wither away on the desert basin floors before uniting in a trunk river along the axis of a depression; others succeed in uniting in the winter season, when evaporation is much reduced, and then their trunk flows for a few score miles, only to disappear by "sinking" (evaporating) farther on. A few of the large streams may, when in flood, spread out in a temporary shallow sheet on a dead level of clay, or *playa*, in a basin centre, but the sheet of water vanishes in the warm season and the stream shrinks far up its course, the absolutely barren clay floor of the playa, impassable when wet, becomes firm enough for crossing when dry. One of the south-western basins, with its floor below sea-level, has a plain of salt in its centre. A few of the basins are occupied by lakes without outlet, of which Great Salt Lake (*q.v.*), in north-west Utah, is the largest. Several smaller lakes occur in the basins of western Nevada, next east of the Sierra Nevada. During Pleistocene times all these lacustrine basins were occupied by lakes of much greater depth and larger size; the outlines of the eastern (Lake Bonneville) and the western (Lake Lahontan) water bodies are well recorded by shore lines and deltas on the enclosing slopes, hundreds of feet above the present lake surfaces; the abandoned shore lines, as studied by G. K. Gilbert and I. C. Russell, have yielded evidence of past climatic changes second in importance only to those of the Pleistocene glaciated areas. The duration of the Pleistocene lakes was, however, brief as compared with the time since the dislocation of the faulted blocks, as is shown by the small dimensions of the lacustrine beaches compared to the great volume of the ravine-heading fans on which the beaches often lie.

The Pacific Ranges.

Strong mountain ranges follow the trend of the Pacific coast, 150 or 200 m. inland. The Cascade Range enters from Canada, trending southward across the international boundary through Washington and Oregon to latitude 41°; the Sierra Nevada extends thence south-eastward through California to latitude 35°. The lower coast ranges, nearer the ocean, continue a little farther southward than the Sierra Nevada, before giving way to that part of the Basin Range province which reaches the Pacific in southernmost California.

The Cascade Range is in essence a maturely dissected highland, composed in part of upwarped Columbian lavas, in part of older rocks, and crowned with several dissected volcanoes, of which the chief are (beginning in the north) Mts Baker (10,827 ft.), Rainier (14,363 ft.), Adams (12,470 ft.) and Hood (11,225 ft.); the first three in Washington, the last in northern Oregon. These bear snowfields and glaciers; while the dissected highlands, with ridges of very irregular arrangement, are everywhere sculptured in a fashion that strongly suggests the work of numerous local Pleistocene glaciers as an important supplement to preglacial erosion. Lake Chelan, long and narrow, deep set between spurless ridges with hanging lateral valleys, and evidently of glacial origin, ornaments one of the eastern valleys. The range is squarely transected by the Columbia river, which bears every appearance of antecedent origin: the cascades in the river gorge are caused by a sub-recent landslide of great size from the mountain walls. Klamath river, draining several lakes in the north-west part of the Basin Range province and traversing the Cascade Range to the Pacific, is apparently also an antecedent river.

The Cascade Mountains present a marked example of the effect of relief and aspect on rainfall; they rise across the path of the prevailing westerly winds not far inland from a great ocean; hence they receive an abundant rainfall (80 in. or more, annually) on the westward or windward slope, and there they are heavily forested; but the rainfall is light on the eastward slope and the piedmont district is dry; hence the forests thin out on that side of the range and treeless lava plains follow next eastward.

The Sierra Nevada may be described, in a very general way, as a great mountain block, largely composed of granite and deformed metamorphosed rocks, reduced to moderate relief in an earlier (Cretaceous and Tertiary?) cycle of erosion, sub-recently elevated with a slant to the west, and in this position sub-maturely dissected. The region was by no means a peneplain before its slanting uplift; its surface then was hilly and in the south mountainous; in its central and still more in its northern part it was overspread with lavas which flowed westward along the broad open valleys from many vents in the eastern part: near the northern end of the range, eruptions have continued in the present cycle, forming many cones and young lava flows. The tilting of the mountain mass was presumably not a simple or a single movement; it was probably slow, for Pitt river (headwaters of the Sacramento) traverses the northern part of the range in antecedent fashion; the tilting involved the subdivision of the great block into smaller ones, in the northern half of the range at least; Lake Tahoe (altitude 6225 ft.) near the range crest is explained as occupying a depression between two block fragments; and farther north similar depressions now appear as aggraded highland "meadows." The tilting of the great block resulted in presenting a strong slope to the east, facing the deserts of the Basin Range province and in large measure determining their aridity; and a long moderate slope to the west. The altitudes along the upraised edge of the block, or range crest, are approximately 5000 ft. in the north and 11,000 ft. in the south. The mountains in the southern part of the block, which had been reduced to subdued forms in the former cycle of erosion, were thus given a conspicuous height, forming the "High Sierra," and greatly sharpened by revived erosion, normal and glacial. In this way Mt Whitney (14,502 ft.) came to be the highest summit in the United States (excluding Alaska). The displacement of the mountain block may still be in progress, for severe earthquakes have happened in the depression next east of the range; that of Owen's Valley in 1870 was strong enough to have been very destructive had there been anything in the desert valley to destroy. In the new altitude of the mountain mass, its steep eastern face has been deeply carved with short canyons; and on the western slope an excellent beginning of dissection has been made in the erosion of many narrow valleys, whose greatest depth lies between their headwaters which still flow on the highland surface, and their mouths at the low western base of the range. The highlands and uplands between the chief valleys are but moderately dissected; many small side streams still flow on the highland, and descend by steeply incised gorges to the valleys of the larger rivers. Some of the chief valleys are not cut in the floors of the old valleys of the former cycle, because the rivers were displaced from their former courses by lava flows, which now stand up as table mountains. Glacial erosion has been potent in excavating great cirques and small rock-basins, especially among the higher southern surmounting summits, many of which have been thus somewhat reduced in height while gaining an Alpine sharpness of form; some of the short and steep canyons in the eastern slope have been converted into typical glacial troughs, and huge moraines have been laid on the desert floor below them. Some of the western valleys have also in part of their length been converted into U-shaped troughs; the famous Yosemite Valley, eroded in massive granite, with side cliffs 1000 or 2000 ft. in height, and the smaller Hetch-Hetchy Valley not far away, are regarded by some observers as owing their peculiar forms to glacial modifications of normal preglacial valleys.

The western slope of the Sierra Nevada bears fine forests similar to those of the Cascade Range and of the Coast Range, but of more open growth, and with the redwood exchanged for groves of "big trees" (*Sequoia gigantea*) of which the tallest examples reach 325 ft. The higher summits in the south are above the tree line and expose great areas of bare rock: mountaineering is here a delightful summer recreation, with camps in the highland forests and ascents to the lofty peaks. Gold occurs in quartz veins traversing various formations (some as young as Jurassic), and also in gravels, which were for the most part deposited previous to the uplift of the Sierra "block." Some of the gravels then occurred as piedmont deposits along the western border of the old mountains; these gravels are now more or less dissected by new-cut valleys. Other auriferous gravels are buried under the upland lava flows, and are now reached by tunnels driven in beneath the rim of the table mountains. The reputed discovery of traces of early man in the lava-covered gravels has not been authenticated.

The northernmost part of the coast ranges, in Washington, is often given independent rank as the Olympic Range (Mt Olympus, 8150 ft.); it is a picturesque mountain group, bearing snowfields and glaciers, and suggestive of the dome-like uplift of a previously worn-down mass; but it is now so maturely dissected as to make the suggested origin uncertain. Farther south, through Oregon and northern California, many members of the coast ranges resemble the Cascades and the Sierra in offering well-attested examples of the uplift of masses of disordered structure, that had been reduced to a tame surface by the erosion of an earlier cycle, and that are now again more or less dissected.

Several of the ranges ascend abruptly from the sea; their base is cut back in high cliffs; the Sierra Santa Lucia, south of San Francisco, is a range of this kind; its seaward slope is almost uninhabitable. Elsewhere moderate re-entrants between the ranges have a continuous beach, concave seaward; such re-entrants afford imperfect harbourage for vessels; Monterey Bay is the most pronounced example of this kind. On still other parts of the coast a recent small elevatory movement has exposed part of the former sea bottom in a narrow coastal plain, of which some typical harbourless examples are found in Oregon. Most of the recent movements appear to have been upward, for the coast presents few embayments such as would result from the depression and partial submergence of a dissected mountain range; but three important exceptions must be made to this rule.

In the north, the Strait of Juan de Fuca and the intricately branching waterways of Puget Sound between the Cascade and the Olympic ranges occupy trough-like depressions which were filled by extensive glaciers in Pleistocene times; and thus mark the beginning of the great stretch of fiorded coast which extends northward to Alaska. The waterways here afford excellent harbours. The second important embayment is the estuary of the Columbia river; but the occurrence of shoals at the mouth decreases the use that might otherwise be made of the river by ocean-going vessels. More important is San Francisco Bay, situated about midway on the Pacific coast of the United States, the result of a moderate depression whereby a transverse valley, formerly followed by Sacramento river through the outermost of the Coast ranges, has been converted into a narrow strait—the "Golden Gate"—and a wider intermont longitudinal valley has been flooded, forming the expansion of the inner bay.

The Coast Range is heavily forested in the north, where rainfall is abundant in all seasons; but its lower ranges and valleys have a scanty tree growth in the south, where the rainfall is very light: here grow redwoods (*Sequoia sempervirens*) and live oaks (*Quercus agrifolia*). The chief metalliferous deposits of the range are of mercury at New Almaden, not far south of San Francisco. The open valleys between the spaced ranges offer many tempting sites for settlement, but in the south irrigation is needed for cultivation.

The belt of relative depression between the inner Pacific ranges and the Coast range is divided by the fine volcano Mt Shasta (14,380 ft.) in northern California into unlike portions. To the north, the floor of the depression is for the most part above baselevel, and hence is dissected by open valleys, partly longitudinal, partly transverse, among hills of moderate relief. This district was originally for the most part forested, but is now coming to be cleared and farmed.

South of Mt Shasta, the "Valley of California" is an admirable example of an aggraded intermont depression, about 400 m. long and from 30 to 70 m. wide. The floor of this depression being below baselevel, it has necessarily come to be the seat of the mountain waste brought down by the many streams from the newly uplifted

Sierra Nevada on the east and the coast ranges on the west; each stream forms an alluvial fan of very gentle slope; the fans all become laterally confluent, and incline very gently forward to meet in a nearly level axial belt, where the trunk rivers—the Sacramento from the north and the San Joaquin from the south-east—wander in braided courses; their tendency to aggradation having been increased in the last half century by the gravels from gold washing; their waters entering San Francisco Bay. Kings river, rising in the high southern Sierra near Mt Whitney, has built its fan rather actively, and obstructed the discharge from the part of the valley next farther south, which has thus come to be overflowed by the shallow waters of Tulare Lake, of flat, reedy, uncertain borders. A little north of the centre of the valley rise the Marysville Buttes, the remains of a maturely dissected volcano (2128 ft.). Elsewhere the floor of the valley is a featureless, treeless plain. (W. M. D.)

II.—Geology

All the great systems of rock formations are represented in the United States, though close correlation with the systems of Europe is not always possible. The general geological column for the country is shown in the following table:—

Eras of Time. *Groups of Systems.*	*Periods of Time.* *Systems of Rocks.*
Cainozoic	Present.
	Pleistocene.
	Pliocene.
	Miocene.
	Oligocene.
	Eocene.
	Transition (Arapahoe and Denver formations).
Mesozoic	Upper Cretaceous.
	Widespread unconformity.
	Comanchean (Lower Cretaceous).
	Jurassic.
	Triassic.
Palaeozoic	Permian.
	Coal Measures, or Pennsylvanian.
	Widespread unconformity.
	Subcarboniferous, or Mississippian.
	Devonian.
	Silurian.
	Widespread unconformity.
	Ordovician.
	Cambrian.
Proterozoic	*Great unconformity.*
	Keweenawan.
	Widespread unconformity.
	Upper Huronian.
	Widespread unconformity.
	Middle Huronian.
	Widespread unconformity.
	Lower Huronian.
Archeozoic	*Great unconformity.*
	Archean: Great Granitoid Series (intrusive in the main, Laurentian).
	Archean: Great Schist Series (Mona, Kitchi, Keewatin, Quinnissec; Lower Huronian of some authors).

Archeozoic (Archean) Group.—The oldest group of rocks, called the Archean, was formerly looked upon, at least in a tentative way, as the original crust of the earth or its downward extension, much altered by the processes of metamorphism. This view of its origin is now known not to be applicable to the Archean as a whole, since this system contains some metamorphosed sedimentary rocks. In other words, if there was such a thing as an original crust, which may be looked upon as an open question, the Archean, as now defined, does not appear to represent it. The meta-sedimentary rocks of the Archean include metamorphosed limestone, and schists which carry carbonaceous matter in the form of graphite. The marble and graphite, as well as some other indirect evidence of life less susceptible of brief statement, have been thought by many geologists sufficient to warrant the inference that life existed before the close of the era when the Archean rocks were formed. Hence the era of their formation is called the Archeozoic era.

Most of the Archean rocks fall into one or the other of two great series, a schistose series and a granitoid series, the latter being in large part intrusive in the former. The rocks of the granitoid series appear as great masses in the schist series, and in some places form great protruding bosses. They were formerly regarded as older than the schists and were designated on this account "primitive," "fundamental," &c. They have also been called *Laurentian*, a name which is still sometimes applied to them.

Nearly all known sorts of schist are represented in the schistose part of the system. Most of them are the metamorphic products of igneous rocks, among which extrusive rocks, many of them pyroclastic, predominate. Metamorphosed sedimentary rocks are widely distributed in the schistose series, but they are distinctly subordinate to the meta-igneous rocks, and they are so highly metamorphic that stratigraphic methods are not usually applicable to them. In some areas, indeed, it is difficult to say whether the schists are meta-sedimentary or meta-igneous. The likeness of the Archean of one part of the country to that of another is one of its striking features.

The Archean appears at the surface in many parts of the United States, and in still larger areas north of the national boundary. It appears in the cores of some of the western mountains, in some of the deep canyons of the west, as in the Grand Canyon of the Colorado in northern Arizona, and over considerable areas in northern Wisconsin and Minnesota, in New England and the piedmont plateau east of the Appalachian Mountains, and in a few other situations. Wherever it comes to the surface it comes up from beneath younger rocks which are, as a rule, less metamorphic. By means of deep borings it is known at many points where it does not appear at the surface, and is believed to be universal beneath younger systems.

Locally the Archean contains iron ore, as in the Vermilion district of northern Minnesota, and at some points in Ontario. The ore is mostly in the form of haematite.

Proterozoic (Algonkian) Systems.—The Proterozoic group of rocks (called also Algonkian) includes all formations younger than the Archean and older than the Palaeozoic rocks. The term Archean was formerly proposed to include these rocks, as well as those now called Archean, but the subdivision here recognized has come to be widely approved.

The Proterozoic formations have a wide distribution. They appear at the surface adjacent to most of the outcrops of the Archean, and in some other places. In many localities the two groups have not been separated. In some places this is because the regions where they occur have not been carefully studied since the subdivision into Archeozoic and Proterozoic was made, and in others because of the inherent difficulty of separation, as where the Proterozoic rocks are highly metamorphosed. On the whole, the Proterozoic rocks are predominantly sedimentary and subordinately igneous. Locally both the sedimentary and igneous parts of the group have been highly metamorphosed; but as a rule the alteration of the sedimentary portions has not gone so far that stratigraphic methods are inapplicable to them, though in some places detailed study is necessary to make out their structure.

The Proterozoic formations are unconformable on the Archean in most places where their relations are known. The unconformity between these groups is therefore widespread, probably more so than any later unconformity. Not only is it extensive in area, but the stratigraphic break is very great, as shown by (1) the excess of metamorphism of the lower group as compared with the upper, and (2) the amount of erosion suffered by the older group before the deposition of the younger. The first of these differences between the two systems is significant of the dynamic changes suffered by the Archean before the beginning of that part of the Proterozoic era represented by known formations. The extent of the unconformity is usually significant of the geographic changes of the interval unrecorded by known Proterozoic rocks.

The Proterozoic formations have been studied in detail in few great areas. One of these is about Lake Superior, where the formations have attracted attention on account of the abundant iron ore which they contain. Four major subdivisions or systems of the group have been recognized in this region, as shown in the preceding table. These systems are separated one from another by unconformities in most places, and the lower systems, as a rule, have suffered a greater degree of metamorphism than the upper ones, though this is not to be looked upon as a hard and fast rule. The commoner sorts of rock in the several Huronian systems are quartzite and slate (ranging from shale to schist); but limestone is not wanting, and igneous rocks, both intrusive and extrusive, some metamorphic and some not, abound. Iron ore occurs in the sedimentary part of the Huronian, especially in Minnesota, Michigan, Wisconsin and parts of Canada. The ore is chiefly haematite, and has been developed from antecedent ferruginous sedimentary deposits, through concentration and purification by ground water.

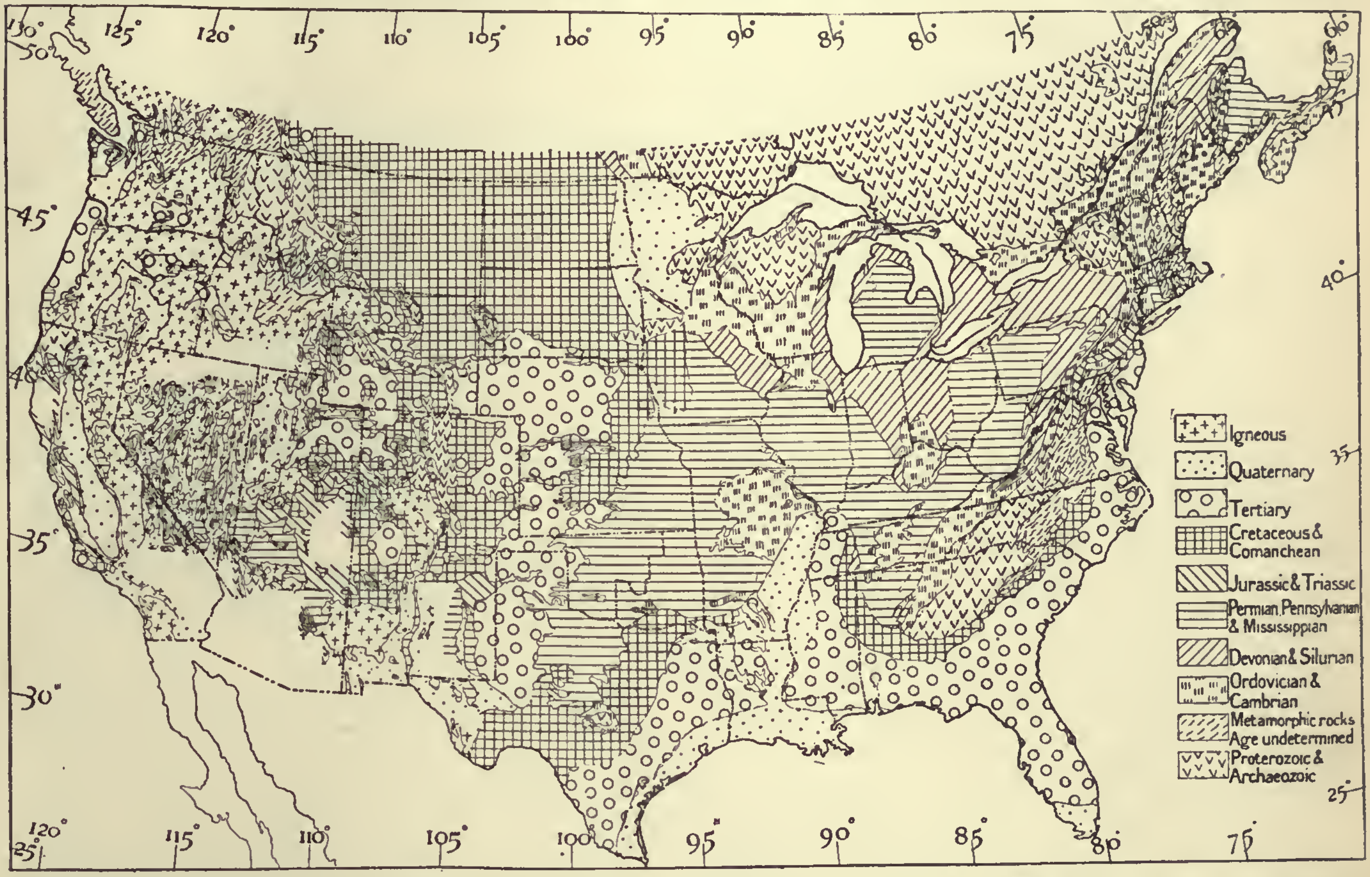
The lower part of the Keweenawan system consists of a great succession of lava flows, of prodigious thickness. This portion of the system is overlain by thick beds of sedimentary rock, mostly conglomerate and sandstone, derived from the igneous rocks beneath. A few geologists regard the sedimentary rocks here classed as Keweenawan as Palaeozoic; but they have yielded no fossils, and are unconformable beneath the Upper Cambrian, which is the oldest sedimentary formation of the region which bears fossils. The aggregate thickness of the Proterozoic systems in the Lake Superior region is several miles, as usually computed, but there are obvious difficulties in determining the thickness of such great systems, especially when they are much metamorphosed. The copper of the Lake Superior region is in the Keweenawan system, chiefly in its sedimentary and amygdaloidal parts.

The Proterozoic formations in other parts of the continent cannot be correlated in detail with those of the Lake Superior region. The number of systems is not everywhere the same, nor are they everywhere alike, and their definite correlation with one another is not possible now, and may never be. The Proterozoic formations have yielded a few fossils in several places, especially Montana and northern Arizona; but they are so imperfect, their numbers, whether of individuals or of species, are so small, and the localities where they occur so few, that they are of little service in correlation throughout the United States. The carbon-bearing shales, slates and schists, and the limestone, are indications that life was relatively abundant, even though but few fossils are preserved. Among the known fossils are vermes, crustacea and probably brachiopods and pteropods

The character of the sediments of the Proterozoic is such as to show that mature weathering affected the older rocks before their material was worked over into the Proterozoic formations. This mature weathering, resulting in the relatively complete separation of the quartz from the kaolin, and both from the calcium carbonate and other basic materials, implies conditions of rock decay comparable to those of the present time.

In all but a few places where their relations are known, the Proterozoic rocks are unconformable beneath the Palaeozoic Where conformity exists the separation is made on the basis of fossils, it having been agreed that the oldest rocks carrying the Olenellus fauna are to be regarded as the base of the Cambrian system.

The Palaeozoic and later formations are usually less altered, more accessible, and better known than the Proterozoic and Archeozoic, and will be taken up by systems.



Cambrian System.—The lower part of the Cambrian system, characterized by the Olenellus fauna, is restricted to the borders of the continent, where it rests on the older rocks unconformably in most places. The middle part of the system, characterized by the Paradoxides fauna, is somewhat more widespread, resting on the lower part conformably, but overlapping it, especially in the south and west. The upper part of the system, carrying the Dicellocephalus fauna, is very much more extensive; it is indeed one of the most widespread series of rocks on the continent. The lower, middle and upper parts of the system all contain marine fossils. This being the case, the distribution of the several divisions indicates that progressive submergence of the United States was in progress during the period, and that most of the country was covered by the sea before its close.

The system is composed chiefly of clastic rocks, and their composition and structure show that the water in which they were deposited was shallow. In the interior, the upper part of the system, the Potsdam sandstone, is generally arenaceous. It is well exposed in New York, Wisconsin, Missouri and elsewhere, about the outcrops of older rocks. The system is also exposed in many of the western mountains or about their borders, especially about those the cores of which are of Archean or Proterozoic rock.

The thickness of the system has been estimated at 10,000 to 12,000 ft. in eastern New York, and almost as much in the southern Appalachian Mountains (Georgia and Alabama); but its average thickness is much less. In Wisconsin, where the Upper Cambrian only is present, the thickness is about 1000 ft. The greater thickness in the east appears to be due in part to the fact that an extensive area of land, *Appalachia*, lay east of the site of the Appalachian Mountains throughout the Palaeozoic era, and quantities of sediment from it were accumulated where these mountains were to arise later. The greatness of the thickness, as it has been measured, is also due in part to the oblique position in which the beds of sediment were originally deposited.

The Cambrian formations have not been notably metamorphosed, except in a few regions where dynamic metamorphism has been effective. The system is without any notable amount of igneous rock. As in other parts of the world, the system here contains abundant fossils, among which trilobites, brachiopods and worms are the most abundant. The range of forms, however, is great.

Ordovician System.—The succeeding Ordovician (Lower Silurian) system of rocks is closely connected with the Cambrian, geographically, stratigraphically and faunally. Its distribution is much the same as that of the Upper Cambrian, with which it is conformable in many places. The Ordovician system contains much more limestone, and therefore much less clastic rock, than the Cambrian, pointing to clearer seas in which life abounded. The succession of beds in New York has become a sort of standard with which the system in other parts of the United States has been compared. The succession of formations in that state is as follows:—

Ordovician	Upper Ordovician (or Cincinnatian)	Richmond beds (in Ohio and Indiana). Lorraine beds. Utica shales.
	Middle Ordovician (or Mohawkian)	Trenton limestone. Black River limestone. Lowville limestone.
	Lower Ordovician (or Canadian)	Chazy limestone. Beekmantown limestone. (=Calciferous).

The classification in the right-hand column of this table is not applicable in detail to regions remote from New York.

There is in some places an unconformity between the Richmond beds (or their equivalent) and underlying formations, and this unconformity, together with certain palaeontological considerations, has raised the question whether the uppermost part of the system, as outlined above, should not be classed as Silurian (Upper Silurian). Over the interior the strata are nearly horizontal, but in the mountain regions of the east and west, as well as in the mountains of Arkansas and Oklahoma, they are tilted and folded, and locally much metamorphosed. The outcrops of the system appear for the most part in close association with the outcrops of the Cambrian system, but the system appears in a few places where the Cambrian does not, as in southern Ohio and central Tennessee. The thickness of the system varies from point to point, being greatest in the Appalachian Mountains, and much less in the interior.

The oil and gas of Ohio and eastern Indiana come from the middle portion of the Ordovician system. So also do the lead and zinc of south-western Wisconsin and the adjacent parts of Iowa and Illinois. The lead of south-eastern Missouri comes from about the same horizon.

The fossils of the Ordovician system show that life made great progress during the period, in numbers both of individuals and of species. The life, like that of the later Cambrian, was singularly cosmopolitan, being in contrast with the provincial character of the life of the earlier Cambrian and of the early (Upper) Silurian which followed. Beside the expansion of types which abounded in the Cambrian, vertebrate remains (fishes) are found in the Ordovician. So, also, are the first relics of insects. The departure of the Ordovician life from that of the Cambrian was perhaps most pronounced in the great development of the molluscs and crinoids (including cystoids), but corals were also abundant for the first time, and graptolites came into prominence.

Silurian System.—The Silurian system is much less widely distributed than the Ordovician. This and other corroborative facts imply a widespread emergence of land at the close of the Ordovician period. As a result of this emergence the stratigraphic break between the Ordovician and the Silurian is one of the greatest in the whole Palaeozoic group.

The classification of the system in New York is as follows:—

Silurian	Cayugan (Neo- or Upper Silurian)	Manlius limestone.
		Rondout waterlime.
		Cobleskill limestone.
		Salina beds.
	Niagaran (Meso- or Middle Silurian)	Guelph dolomite.
		Lockport limestone.
		Rochester shale.
		Clinton beds.
	Oswegan (Palaeo-or Lower Silurian)	Medina sandstone.
		Oneida conglomerate.
		Shawangunk grit.

The lower part of this system is chiefly clastic, and is known only in the eastern part of the continent. The middle portion contains much limestone, generally known as the Niagara limestone, and is much more widespread than the lower, being found very generally over the eastern interior, as far west as the Mississippi and in places somewhat beyond. The Niagara limestone contains the oldest known coral reefs of the continent. They occur in eastern Wisconsin and at other points farther east and south. It is over this limestone that the Niagara falls in the world-famous cataract. One member of the middle division of the system (Clinton beds) contains much iron ore, especially in the Appalachian Mountain region. The ore is extensively worked at some points, as at Birmingham, Alabama. The upper part of the system is more restricted than the middle, and includes the salt-bearing series of New York, Ohio and Pennsylvania, with its peculiar fauna. It is difficult to see how salt could have originated in this region except under conditions very different climatically from those of the present time.

In the interior the thickness of the system is less than 1000 ft. in many places, but in and near the Appalachian Mountains its thickness is much greater—more than five times as great if the maximum thicknesses of all formations be made the basis of calculation. In the Great Plains and farther west the Silurian has little known representation. Either this part of the continent was largely land at this time, or the Silurian formations here have been worn away or remain undifferentiated. Rocks of Silurian age, however, are known at some points in Arizona, Nevada and southern California.

Corals, echinoderms, brachiopods and all groups of molluscs abounded. Graptolites had declined notably as compared with the Ordovician, and the trilobites passed their climax before the end of the period. Certain other remarkable crustacea, however, had made their appearance, especially in connexion with the Salina series of the east.

There are numerous outliers of the Silurian north of the United States, even up to the Arctic regions. These outliers have a common fauna, which is closely related to that of the interior of the United States. They give some clue to the amount of erosion which the system has suffered, and also afford a clue to the route by which the animals whose fossils are found in the United States entered this country. Thus, the Niagara fauna of the interior of the United States has striking resemblances to the mid-Silurian faunas of Sweden and Great Britain. It seems probable, therefore, that marine animals found migratory conditions between these regions, probably by way of northern islands. The fauna of the Appalachian region is far less like that of Europe, and indicates but slight connexion with the fauna of the interior. Both the earlier and the later parts of the Silurian period seem to have been times when physical conditions were such as to favour the development of provincial faunas, while during the more widespread submergence of the middle Silurian the fauna was more cosmopolitan.

Devonian System.—The Devonian system appears in some parts of New England, throughout most of the Appalachian region, over much of the eastern interior from New York to the Missouri River, in Oklahoma, and perhaps in Texas. It is absent from the Great Plains, so far as now known, and is not generally present in the Rocky Mountains, though somewhat widespread between them and the western coast. As a whole, the system is more widespread than the Silurian, though not so widespread as the Ordovician. As in the case of the Ordovician and the Silurian, the New York section has become a standard with which the system in other parts of the country is commonly compared. This section is as follows:—

Devonian	Upper Devonian	Chautauquan-Chemung (including Catskill).	
		Senecan	Portage beds.
			Genesee shale.
			Tully limestone.
	Middle Devonian	Erian	Hamilton shale.
			Marcellus shale.
		Ulsterian	Onondaga (Corniferous limestone)
			Schoharie grit.
			Esopus grit.
	Lower Devonian	Oriskanian	Oriskany beds.
		Helderbergian	Kingston beds.
			Becraft limestone.
			New Scotland beds.
			Coeymans limestone.

The formations most widely recognized are the Helderberg limestone, the Onondaga limestone and the Hamilton shale.

The Catskill sandstone, found chiefly in the Catskill Mountain region of New York, is one of the distinctive formations of the system. It has some similarity to the Old Red Sandstone of Great Britain. In part, at least, it is equivalent in time of origin to the Chemung formation; but the latter is of marine origin, while the Catskill formation appears to be of terrestrial origin.

No other system of the United States brings out more clearly the value of palaeontology to palaeogeography. The faunas of the early Devonian seem to have entered what is now the interior of the United States from the mid-Atlantic coast. The Onondaga fauna which succeeded appears to have resulted from the commingling of the resident lower Devonian fauna with new emigrants from Europe by way of the Arctic regions. The Hamilton fauna which followed represents the admixture of the resident Onondaga fauna with new types which are thought to have come from South America, showing that faunal connexions for marine life had been made between the interior of the United States and the lands south of the Caribbean Sea, a connexion of which, before this time, there was no evidence. The late Devonian fauna of the interior represents the commingling of the Hamilton fauna of the eastern interior with new emigrants from the north-west, a union which was not effected until toward the close of the period.

Like the earlier Palaeozoic systems, the Devonian attains its greatest known thickness in the Appalachian Mountains, where sediments from the lands of pre-Cambrian rock to the east accumulated in quantity. Here clastic rocks predominate, while limestone is more abundant in the interior. If the maximum thicknesses of all Devonian formations be added together, the total for the system is as much as 15,000 ft.; but such a thickness is not found in any one place.

The Devonian system yields much oil and gas in western Pennsylvania, south-western New York, West Virginia and Ontario; and some of the Devonian beds in Tennessee yield phosphates of commercial value. The Hamilton formation yields much flagstone.

Among the more important features of the marine life of the period were (1) the great development of the molluscs, especially of cephalopods; (2) the abundance of large brachiopods; (3) the aberrant tendencies of the trilobites; (4) the profusion of corals; and (5) the abundance, size and peculiar forms of the fishes. The life of the land waters was also noteworthy, especially for the great deployment of what may be called the crustacean-ostracodermo-vertebrate group. The crustacea were represented by eurypterids, the ostracoderms by numerous strange, vertebrate-like forms (*Cephalaspis*, *Cyathaspis*, *Trematopsis*, *Bothriolepis*, &c.), and the vertebrates by a great variety of fishes. The land life of the period is represented more fully among the fossils than that of any preceding period. Gymnosperms were the highest types of plants.

The Devonian system is not set off from the Mississippian by any marked break. On the other hand, the one system merges into the other, so that the plane of separation is often indistinct.

Mississippian System.—The Mississippian system was formerly regarded as a part of the Carboniferous, and was described under the name of Lower Carboniferous, or Subcarboniferous, without the rank of a system. This older classification, which has little support except that which is traditional, is still adhered to by many geologists; but the fact seems to be that the system is set off from the Pennsylvanian (Upper Carboniferous) more sharply than the Cambrian is from the Ordovician, the Silurian from the Devonian, or the Devonian from the Mississippian.

The system is well developed in the Mississippi Basin, whence its name. Its formations are much more widespread than those of any other system since the Ordovician. They appear at the surface in great areas in the interior, in the south-west and about many of the western mountains. In many places in the west they rest on what appear to be Ordovician beds, but without unconformity. The explanation of the apparent conformity of the strata from the Cambrian to the Pennsylvanian in some parts of the west, with no fossils defining with certainty any horizon between the Ordovician and the Mississippian, is one of the open problems in the geology of the United States.

The subdivision of the system for various regions in the eastern part of the United States is as follows:—

Mississippi River States.	Ohio.	Pennsylvania.	Maryland.
4. Kaskaskia or Chester	7. Maxville		
3. St Louis	6. Logan		3. Mauch Chunk
2. Osage or Augusta (including the Burlington, Keokuk and Warsaw)	5. Black Hand 4. Cuyahoga 3. Sunbury 2. Berea grit	2. Mauch Chunk	2. Greenbrier
1. Kinderhook or Chouteau	1. Bedford	1. Pocono	1. Pocono

In the interior the Kinderhook series has a distribution similar to that of the Devonian; the Osage series is more widespread, pointing to progressive submergence; and the St Louis is still more extensive. This epoch, indeed, is the epoch of maximum submergence during the period, and the maximum since the Ordovician. Before its close the sea of the Great Basin which had persisted since the Devonian was connected with the shallow sea which covered much of the interior of the United States. The fourth series, the Kaskaskia or Chester, is more restricted, and points to the coming emergence of a large part of the United States. In the Mississippi Basin the larger part of the system is of limestone, though there is some clastic material in both its basal and its upper parts. In Ohio the system contains much clastic rock, and in Pennsylvania little else. The Mauch Chunk series (shale and sandstone) is now believed to be largely of terrestrial origin.

The system ranges in thickness from nearly 5000 ft. maximum in Pennsylvania to 1500 ft. in the vicinity of the Mississippi river. In West Virginia some 2000 ft. of limestone are assigned to this system. The zinc and lead of the Joplin district of Missouri are in the limestone of this system, and the corresponding limestone in some parts of Colorado, as at Leadville, is one of the horizons of rich ore.

The end of the period was marked by the widespread emergence of the continent, and parts of it were never again submerged, so far as is known. Certainly there is no younger marine formation of comparable extent in the continent. When deposition was renewed in the interior of the continent, the formations laid down were largely non-marine, and, over great areas, they rest upon the Mississippian unconformably.

From the conditions outlined it is readily inferred that the faunas of the system were cosmopolitan. All types of life to which shallow, clear sea-water was congenial appear to have abounded in the interior. It was perhaps at this time that the crinoids, as a class, reached their climax, and most forms of lime-carbonate-secreting life seem to have thriven. Where the seas were less clear, as in Ohio, the conditions are reflected in the character of the fossils. Marine fishes had made great progress before the close of the period. Amphibia appeared before its close, and plant life was abundant and varied, though the types were not greatly in advance of those of the Devonian. The time of such widespread submergence was hardly the time for the great development of land vegetation.

Pennsylvanian System.—The Pennsylvanian or Upper Carboniferous system overlies the Mississippian unconformably over a large part of the United States. In the eastern half of the country the system consists of shales and sandstones chiefly, but there is some limestone, and coal enough to be of great importance economically, though it makes but a small part of the system quantitatively. The larger part of the system in this part of the country is not of marine origin; yet the sea had access to parts of the interior more than once, as shown by the marine fossils in some of the beds. The dominantly terrestrial formations of the eastern half of the country are in contrast with the marine formations of the west. The line separating the two phases of the system is a little east of the 100th meridian. West of the Mississippi the Coal Measures are subdivided into two series, the Des Moines below and the Missouri above. In the eastern part of the country (Pennsylvania, Ohio, &c.) the system is divided into four principal parts:—

Pennsylvanian.
- 4. Monongahela formation (or series)—Upper Productive Coal Measures.
- 3. Conemaugh formation (or series)—Lower Barren Coal Measures.
- 2. Allegheny formation (or series)—Lower Productive Coal Measures.
- 1. Pottsville formation (or series).

The Pottsville formation is chiefly clastic, and corresponds roughly to the Millstone Grit of England. The Allegheny and Monongahela series contain most of the coal, though it is not wanting in the other subdivisions of the system. Productive coal beds are found in five principal fields. These are (1) the Anthracite field in eastern Pennsylvania, nearly 500 sq. m. in extent; (2) the Appalachian field, having an area of about 71,000 sq. m. (75 % being productive), and extending from Pennsylvania to Alabama; (3) the northern interior field, covering an area of about 11,000 sq. m. in southern Michigan; (4) the eastern interior field in Indiana, Illinois and Kentucky, with an area of about 58,000 sq. m. (55 % being productive); and (5) the western interior and south-western field, some 94,000 sq. m. in extent, reaching from Iowa on the north to Texas on the south. There is also a coalfield in Nova Scotia and New Brunswick, about 18,000 sq. m. in extent. Some of the well-known beds of coal are known to be continuous for several thousands of square miles.

Unlike the older systems of the Palaeozoic, the Pennsylvanian system has not its maximum thickness in the Appalachian Mountains, but in Arkansas, in a region which was probably adjacent to high lands at that time. These lands perhaps lay in the present position of the Ouachita Mountains.

The close of the Pennsylvanian period was marked by the beginning of profound changes, changes in geography and climate, and therefore changes in the amount and habitat of life, and in the sites of erosion and sedimentation. One of the great changes of this time was the beginning of the development of the Appalachian Mountain system. The site of these mountains had been, for the most part, an area of deposition throughout the Palaeozoic era, and the body of sediments which had gathered here at the western base of Appalachia, by the close of the Pennsylvanian period, was very great. At this time these sediments, together with some of Appalachia itself, began to be folded up into the Appalachian Mountains. These mountains have since been worn down, so that, in spite of their subsequent periods of growth, their height is not great.

The chief interest of the palaeontology of this system is in the plants, which were very like those of the Coal Measures of other parts of the earth and showed a high development of forms that are now degenerate. Among land animals the amphibia had great development at this time. So also had insects and some other forms of land life.

Permian Period.—The Permian system appears in smaller areas in the United States than any other Palaeozoic system. The "Upper Barren Coal Measures" of some parts of the east (Ohio, Pennsylvania, &c.) are now classed as Permian on the basis of their fossil plants. They represent but a part of the Permian period, and are commonly described under the name of the Dunkard series.

The system has much more considerable development west of the Mississippi than east of it, especially in Texas, Kansas, Nebraska and beyond. Some of the Permian beds of this region are marine, while others are of terrestrial origin. In this part of the country the Permian beds are largely red sandstone, often saliferous and gypsiferous. They are distinguished with difficulty from the succeeding Triassic, for the beds have very few fossils. The system has its maximum known thickness in Texas, where it is said to be 7000 ft. in maximum thickness. West of the Rocky Mountains the Permian has not been very generally separated from overlying and underlying formations, though it has been differentiated in a few places, as in south-western Colorado and in some parts of Arizona. Perhaps the most remarkable feature of the palaeontology of the system is its paucity of fossils, especially in those parts of the system, such as the Red Beds, which are of terrestrial origin.

In the United States no direct evidence has been found of the low temperature which brought about glaciation in many other parts of the earth during this period. Salt and gypsum deposits, and other features of the Permian beds, together with the fewness of fossils, indicate that the climate of the Permian was notably arid in many regions.

Triassic System.—This system has but limited representation in the eastern part of the United States, being known only east of the Appalachian Mountains in an area which was land throughout most of the Palaeozoic era, but which was deformed when the eastern mountains were developed at the close of the Palaeozoic. In the troughs formed in its surface during this time of deformation, sediments of great thickness accumulated during the Triassic period. These sediments are now mostly in the form of red sandstone and shale, with conglomerate, black shale and coal in some places. These rocks do not represent the whole of the period. They are often known as the Newark series, and seem to be chiefly, if not wholly, of terrestrial origin. The sedimentary rocks are affected by many dikes and sheets of igneous rock, some of the latter being extrusive and some intrusive. The strata are now tilted and much faulted, though but little folded. In the western plains and in the western mountains the Triassic is not clearly separated from the Permian in most places. So far as the system is differentiated, it is a part of the Red Beds of that region. The tendency of recent years has been to refer more and more of these beds to the Permian. The

Triassic system is well developed on the Pacific coast, where its strata are of marine origin, and they extend inland to the Great Basin region.

The climate of the period, at least in its earlier part, seems to have been arid like that of the Permian, as indicated both by the paucity of fossils and by the character of the sediments. The salt and gypsum constitute a positive argument for aridity. The character of some of the conglomerate of the Newark series of the east, and the widespread redness of the beds, so far as it is original, also point to aridity.

As in other parts of the earth, the Triassic was the age of gymnosperms, which were represented by diverse types. Reptiles were the dominant form of animals, and land reptiles (dinosaurs) gained over their aquatic allies.

Jurassic System.—This system is not known with certainty in the eastern half of the United States, though there are some beds on the mid-Atlantic coast, along the inland border of the coastal plain, which have been thought by some, on the basis of their reptilian fossils, to be Jurassic. The lower and middle parts of the system are but doubtfully represented in the western interior. If present, they form a part of the Red Beds of that region. On the Pacific coast marine Jurassic beds reach in from the Pacific to about the same distance as the Triassic system. The Upper Jurassic formations are much more widely distributed. During the later part of the period the sea found entrance at some point north of the United States to a great area in the western part of the continent, developing a bay which extended far down into the United States from Canada. In this great bay formations of marine origin were laid down. At the same time marine sedimentation was continued on the Pacific coast, but the faunas of the west coast and the interior bay are notably unlike, the latter being more like that of the coast north of the United States. This is the reason for the belief that the bay which extended into the United States had its connexion with the sea north of the United States.

The Jurassic faunas of the United States were akin to those of other continents. The great development of reptiles and cephalopods was among the notable features. At the close of the period there were considerable deformations in the west. The first notable folding of the Sierras that has been definitely determined dates from this time, and many other mountains of the west were begun or rejuvenated. The close of the period, too, saw the exclusion of the sea from the Pacific coast east of the Sierras, and the disappearance, so far as the United States is concerned, of the great north-western bay of the late Jurassic. Before the close of the period, the aridity which had obtained during the Permian, and at least a part of the Triassic, seems to have disappeared.

Comanchean System.—This system was formerly classed as the lower part of the Cretaceous, but there are strong reasons for regarding it as a separate system. Its distribution is very different from that of the Upper Cretaceous, and there is a great and widespread unconformity between them. The faunas, too, are very unlike. The Comanchean formations are found (1) on the inland border of the coastal plain of the Atlantic (Potomac series) and Gulf coasts (Tuscaloosa series at the east and Comanchean at the west); (2) along the western margin of the Great Plains and in the adjacent mountains; and (3) along the Pacific coast west of the Sierras. In the first two of these positions, the formations show by their fossils that they are of terrestrial origin in some places, and partly of terrestrial and partly of marine origin in others. In the coastal plain the Comanchean beds are generally not cemented, but consist of gravel, sand and clay, occupying the nearly horizontal position in which they were originally deposited. Much plastic clay and sand are derived from them. In Texas, whence the name "Comanchean" comes, and where different parts of the system are of diverse origins, there is some limestone. This sort of rock increases in importance southward and has great development in Mexico. In the western interior there is difference of opinion as to whether certain beds rich in reptilian remains (the Morrison, Atlantosaurus, Como, &c.) should be regarded as Jurassic or Comanchean. On the western coast the term Shastan is sometimes applied to Lower Cretaceous. In the United States, marine Shastan beds are restricted to the area west of the Sierras, but they here have great thickness.

Widespread changes at the end of the period exposed the areas where deposition has been in progress during the period to erosion, and the (Upper) Cretaceous formations rest upon the Comanchean unconformably in most parts of the country. The Comanchean system contains the oldest known remains of netted-veined leaved plants, which mark a great advance in the vegetable world. Reptiles were numerous and of great size. They were the largest type of life, both on land and in the sea.

Cretaceous System.—This system is much more extensively developed in the United States than any other Mesozoic system. It is found (1) on the Atlantic coastal plain, where it laps up on the Comanchean, or over it to older formations beyond its inland margin; (2) on the coastal plain of the Gulf region in similar relations; (3) over the western plains; (4) in the western mountains; and (5) along the Pacific coast. Unlike the Comanchean, the larger part of the Cretaceous system is of marine origin. The distribution of the beds of marine origin shows that the sea crept up on the eastern and southern borders of the continent during the period, covered the western plains, and formed a great mediterranean sea between the eastern and western lands of the continent, connecting the Gulf of Mexico on the south and the Arctic Ocean on the north. This widespread submergence, followed by the deposition of marine sediments on the eroded surface of Comanchean and older rocks, is the physical reason for the separation of the system from the Comanchean. This reason is reinforced by palaeontological considerations.

Both on the Atlantic and over the western plains the system is divided into four principal subdivisions:—

Atlantic Coast.	*Western Plains.*
4. Manasquan formation.	4. Laramie.
3. Rancocas formation.	3. Montana: Fox Hills; Fort Pierre.
2. Monmouth formation.	2. Colorado: Niobrara; Benton.
1. Matawan formation.	1. Dakota.

The most distinctive feature of the Cretaceous of the Atlantic coastal plain is its large content of greensand marl (glauconite). The formations are mostly incoherent, and have nearly their original position. In the eastern Gulf states there is more calcareous material, represented by limestone or chalk. In the Texan region and farther north the limestone becomes still more important. In the western plains, the first and last principal subdivisions of the system (Dakota and Laramie) are almost wholly non-marine. The Dakota formation is largely sandstone, which gives rise to "hogbacks" where it has been tilted, indurated and exposed to erosion along the eastern base of the Rocky Mountains. The Colorado series contains much limestone, some of which is in the form of chalk. This is *par excellence* the chalk formation of the United States. That the chalk was deposited in shallow, clear seas is indicated both by the character of the fossils other than foraminifera and by the relation of the chalk to the clastic portions of the series. The Montana series, most of which is marine, was deposited in water deeper than that of the Colorado epoch, though the series is less widespread than the preceding. The Laramie is the great coal-bearing series of the west, and corresponds in its general physical make-up and in its mode of origin to the Coal Measures of the east. The coal-bearing lands of the Laramie have been estimated at not less than 100,000 sq. m. On the Pacific coast the Cretaceous formations are sometimes grouped together under the name of Chico. The distribution of the Chico formations is similar to that of the Comanchean system in this region.

The Cretaceous system is thick. If maximum thicknesses of its several parts in different localities, as usually measured, are added together, the total would approach or reach 25,000 ft.; but the strata of any one region have scarcely more than half this thickness, and the average is much less.

The close of the period was marked by very profound changes which may be classed under three general headings: (1) the emergence of great areas which had been submerged until the closing stages of the period; (2) the beginning of the development of most of the great mountains of the west; (3) the inauguration of a protracted period of igneous activity, stimulated, no doubt, by the crustal and deeper-seated movements of the time. These great changes in the relation of land and water, and in topography, led to correspondingly great changes in life, and the combination marks the transition from the Mesozoic to the Cainozoic era.

Tertiary Systems.—The formations of the several Tertiary periods have many points of similarity, but in some respects they are sharply differentiated one from another. They consist, in most parts of the country, of unconsolidated sediments, consisting of gravel, sand, clay, &c., together with large quantities of tuff, volcanic agglomerate, &c. Some of the sedimentary formations are of marine, some of brackish water, and some of terrestrial origin. In the western part of the country there are, in addition, very extensive flows of lava covering in the aggregate some 200,000 sq. m. Terrestrial sedimentation was, indeed, a great feature of the Tertiary. This was the result of several conditions, among them the recent development, through warping and faulting and volcanic extrusion, of high lands with more or less considerable slopes. From these high lands sediments were borne down to lodge on the low lands adjacent. The sites of deposition varied as the period progressed, for the warping and faulting of the surface, the igneous extrusions, and the deposition of sediments obliterated old basins and brought new ones into existence. The marine Tertiary formations are confined to the borders of the continent, appearing along the Atlantic, Gulf and Pacific coasts. The brackish water formations occur in some parts of the same general areas, while the terrestrial formations are found in and about the western mountains. As in other parts of the world, the chiefest palaeontological interest of the Tertiary attaches to the mammalian fossils.

Eocene System.

The Eocene beds are unconformable, generally, upon the Cretaceous, and unconformable beneath the Miocene. On the Atlantic coast they are nearly horizontal, but dip gently seaward. On this coast they are nowhere more than a few hundred feet thick. In the Gulf region the system is more fully represented, and attains a greater thickness—1700 ft. at least. In the Gulf region the Eocene system contains not a little non-marine material. Thus the lower Eocene has some lignite in the eastern Gulf region, while in Texas lignite and saliferous and gypsiferous sediments are found, though most of the system is marine and of shallow water origin. The Eocene of the western Gulf region is continued north as far as Arkansas. The classification of the Eocene (and Oligocene) formations in the Gulf region, especially east of the Mississippi, is as follows:—

4. Jacksonian	Upper Eocene.
3. Claibornian	Middle Eocene.
2. Chickasawan	Lower Eocene.
1. Midwayan	

The Jacksonian is sometimes regarded as Oligocene. This classification is based almost wholly on the fossils, for there seems to be little physical reason for the differentiation of the Oligocene anywhere on the continent.

On the Pacific coast the marine Eocene lies west of the Sierras, and between it and the Cretaceous there is a general, and often a great, unconformity. The system has been reported to have a thickness of more than 7000 ft. in some places, and locally (*e.g.* the Pescadero formation) it is highly metamorphic. The Eocene of southern California carries gypsum enough to be of commercial value. It is also the source of much oil. The system is wanting in northern California and southern Oregon, but appears again farther north, and has great development in Oregon, where its thickness has been estimated at more than 10,000 ft. As in other comparable cases, this figure does not make allowance for the oblique attitude in which the sediments were deposited, and should not be construed to mean the vertical thickness of the system.

In Washington the Eocene is represented by the Puget series of brackish water beds, with an estimated thickness exceeding that of the marine formations of Oregon. Workable coal beds are distributed through 3000 ft. of this series. The amount of the coal is very great, though the coal is soft.

Terrestrial Eocene formations—eolian, fluvial, pluvial and lacustrine—are widespread in the western part of the United States, both in and about the mountains. By means of the fossils, several more or less distinct stages of deposition have been recognized. Named in chronological order, these are:—

1. The *Fort Union stage*, when the deposition was widespread about the eastern base of the northern part of the Rocky Mountains, and at some points in Colorado (Telluride formation) and New Mexico (Puerco beds), where volcanic ejecta entered largely into the formation. The Fort Union stage is closely associated with the Laramie, and their separation has not been fully effected.

2. The *Wasatch stage*, when deposition was in progress over much of Utah and western Colorado, parts of Wyoming, and elsewhere.

3. The *Bridger stage*, when deposition was in progress in the Wind River basin, north of the mountain of that name, and in the basin of Green river.

4. The *Uinta stage*, when the region south of the mountains of that name, in Utah and Colorado, was the site of great deposition.

More or less isolated deposits of some or all of these stages are found at numerous points in the western mountain region. The present height of the deposits, in some places as much as 10,000 ft., gives some suggestion of the changes in topography which have taken place since the early Tertiary. The thickness of the system in the west is great, the formations of each of the several stages mentioned above running into thousands of feet, as thicknesses are commonly measured.

Miocene System. The Miocene system, generally speaking, has a distribution similar to that of the Eocene. The principal formation of the Atlantic coastal plain is the Chesapeake formation, largely of sand. In Florida the system contains calcium phosphate of commercial value. The Miocene of the Atlantic and Gulf regions nowhere attains great thickness. The oil of Texas and Louisiana is from the Miocene (or possibly Oligocene) dolomite. On the Pacific coast the system has greater development. It contains much volcanic material, and great bodies of siliceous shale, locally estimated at 4000 ft. thick and said to be made up largely of the secretions of organisms. Such thicknesses of such material go far to modify the former opinion that the Tertiary periods were short. The Miocene of California is oil-producing. The terrestrial Miocene formations of the western part of the country are similar in kind, and, in a general way, in distribution, to the Eocene of the same region. The amount of volcanic material, consisting of both pyroclastic material and lava flows, is great.

At the close of the Miocene, deformative movements were very widespread in the Rocky Mountains and between the principal development of the Coast ranges of California and Oregon, and mountain-making movements, new or renewed, were somewhat general in the west. At the close of the period the topography of the western part of the country must have been comparable to that of the present time. This, however, is not to be interpreted to mean that it has remained unmodified, or but slightly modified since that time. Subsequent erosion has changed the details of topography on an extensive scale, and subsequent deformative movements have renewed large topographic features where erosion had destroyed those developed by the close of the Miocene. But in spite of these great changes since the Miocene, the great outlines of the topography of the present were probably marked out by the close of that period. Volcanic activity and faulting on a large scale attended the deformation of the closing stages of the Miocene.

Pliocene System. The Pliocene system stands in much the same stratigraphic relation to the Miocene as the Miocene does to the Eocene. The marine Pliocene has but trifling development on the Atlantic coast north of Florida, and somewhat more extensive development in the Gulf region. The marine Pliocene of the continent has its greatest development in California (the Merced series, peninsula of San Francisco), where it is assigned a maximum thickness of nearly 6000 ft., and possibly as much as 13,000 ft. This wide range is open to doubt as to the correlation of some of the beds involved. Thicknesses of several thousand feet are recorded at other points in California and elsewhere along the coast farther north. Marine Pliocene beds are reported to have an altitude of as much as 5000 ft. in Alaska. The position of these beds is significant of the amount of change which has taken place in the west since the Pliocene period. The non-marine formations of the Pliocene are its most characteristic feature. They are widely distributed in the western mountains and on the Great Plains. In origin and character, and to some extent in distribution, they are comparable with the Eocene and Miocene formations of the same region, and still more closely comparable with deposits now making. In addition to these non-marine formations of the west, there is the widespread Lafayette formation, which covers much of the Atlantic and Gulf coastal plain, reaching far to the north from the western Gulf region, and having uncertain limits, so far as now worked out, in various directions. The Lafayette formation has been the occasion of much difference of opinion, but is by many held to be a non-marine formation, made up of gravels, sands and clays, accumulated on land, chiefly through the agency of rain and rivers. Its deposition seems to have followed a time of deformation which resulted in an increase of altitude in the Appalachian Mountains, and in an accentuation of the contrast between the highlands and the adjacent plains. Under these conditions sediments from the high lands were washed out and distributed widely over the plains, giving rise to a thin but widespread formation of ill-assorted sediment, without marine fossils, and, for the most part, without fossils of any kind, and resting unconformably on Cretaceous, Eocene and Miocene formations. To the seaward the non-marine phase of the formation doubtless grades into a marine phase along the shore of that time, but the position of this shore has not been defined. The marine part of the Lafayette is probably covered by sediments of later age.

In earlier literature the Lafayette formation was described under the name of Orange Sand, and was at one time thought to be the southern equivalent of the glacial drift. This, however, is now known not to be the case, as remnants of the formation, isolated by erosion, lie under the old glacial drift in Illinois, and perhaps elsewhere. It seems probable that the Lafayette formation of the Gulf coastal plain is continuous northward and westward with gravel deposits on the Great Plains, washed out from the Rocky Mountains to the west. The careful study of these fluvial formations is likely to throw much light on the history of the deformative movements and changes in topography in the United States during the late stages of geological history.

Deformative movements of the minor sort seem to have been in progress somewhat generally during the Tertiary periods, especially in the western part of the country, but those at the close of the Pliocene seem to have exceeded greatly those of the earlier stages. They resulted in increased height of land, especially in the west, and therefore in increased erosion. This epoch of relative uplift and active erosion is sometimes called the Sierran or Ozarkian epoch. The details of the topography of the western mountains are largely of post-Pliocene development. The summits of some of the high mountains, such as the Cascades, appear to be remnants of a peneplain developed in post-Miocene time. If so, the mountains themselves must be looked upon as essentially post-Pliocene. Deformative movements resulting in close folding were not common at this time, but such movements affected some of the coast ranges of California. This epoch of great deformation and warping marks the transition from the Tertiary to the Quaternary.

Quaternary Formations.—***Glacial.*** The best-known formations of the Quaternary period are those deposited by the continental glaciers which were the distinguishing feature of the period and by the waters derived from them. The glacial drift covers something like half of the continent, though much less than half of the United States. Besides the drift of the ice-sheets, there is much drift in the western mountains, deposited by local glaciers. Such glaciers existed in all the high mountains of the west, even down to New Mexico and Arizona.

The number of glacial epochs now recognized is five, not counting minor episodes. Four defined zones of interglacial deposits are detected, all of which are thought to represent great recessions of the ice, or perhaps its entire disappearance. The climate of some of the interglacial epochs was at least as warm as that of the present time in the same regions. The glacial epochs which have been differentiated are the following, numbered in chronological order: (5) Wisconsin, (4) Iowan, (3) Illinoian, (2) Kansan, (1) Sub-Aftonian, or Jerseyan. Of these, the Kansan ice-sheet was the most extensive, and the later ones constitute a diminishing series.

Essentially all phases of glacial and aqueo-glacial drift are represented. The principal terminal moraines are associated with the ice of the Wisconsin epoch. Terminal moraines at the border of the Illinoian drift are generally feeble, though widely recognizable, and such moraines at the margin of the Iowan and Kansan drift sheets are generally wanting. The edge of the oldest drift sheet is buried by younger sheets of drift in most places.

Loess is widespread in the Mississippi River basin, especially along the larger streams which flowed from the ice. Most of the loess is now generally believed to have been deposited by the wind. The larger part of it seems to date from the closing stages of the Iowan epoch, but loess appears to have come into existence after other glacial epochs as well. Most of the fossils of the loess are shells of terrestrial gastropods, but bones of land mammals are also found in not a few places. Some of the loess is thought to have been derived by the wind from the surface of the drift soon after the retreat of the ice, before vegetation got a foothold upon the new-made deposit; but a large part of the loess, especially that associated with the main valleys, appears to have been blown up on to the bluffs of the valleys from the flood plains below. As might be expected under these conditions, it ranges from fine sand to silt which approaches clay in texture. Its coarser phases are closely associated with dunes in many places, and locally the loess makes a considerable part of the dune material.

Much interest attaches to estimates of time based on data afforded by the consequences of glaciation. These estimates are far apart, and must be regarded as very uncertain, so far as actual numbers are concerned. The most definite are connected with estimates of the time since the last glacial epoch, and are calculated from the amount and rate of recession of certain falls, notably those of the Niagara and Mississippi (St Anthony Falls) rivers. The estimate of the time between the first and last glacial epochs is based on changes which the earlier drift has undergone as compared with those which the younger drift has undergone. Some of the estimates make the lapse of time since the first glacial epoch more than a million years, while others make it no more than one-third as long. The time since the last glacial epoch is but a fraction of the time since the first—probably no more than a fifteenth or a twentieth.

Outside the region affected by glaciation, deposits by wind, rain, rivers, &c., have been building up the land, and sedimentation has been in progress in lakes and about coasts.

Non-glacial.

The non-glacial deposits are much like the Tertiary in kind and distribution, except that marine beds have little representation on the land. On the coastal plain there is the Columbia series of gravels, sands and loams, made up of several members. Its distribution is similar to that of the Lafayette, though the Columbia series is, for the most part, confined to lower levels. Some of its several members are definitely correlated in time with some of the glacial epochs. The series is widespread over the lower part of the coastal plain. In the west the Quaternary deposits are not, in all cases, sharply separated from the late Tertiary, but the deposits of glacial drift, referable to two or more glacial epochs, are readily differentiated from the Tertiary; so, also, are certain lacustrine deposits, such as those of the extinct lakes Bonneville and Lahontan. On the Pacific coast marine Quaternary formations occur up to elevations of a few scores of feet, at least, above the sea.

Igneous rocks, whether lava flows or pyroclastic ejections, are less important in the Quaternary than in the Tertiary, though volcanic activity is known to have continued into the Quaternary. The Quaternary beds of lakes Bonneville and Lahontan have been faulted in a small way since they were deposited, and the old shore lines of these lakes have been deformed to the extent of hundreds of feet. So also have the shorelines of the Great Lakes, which came into existence at the close of the glacial period.

Much has been written and more said concerning the existence of man in the United States before the last glacial epoch. The present state of evidence, however, seems to afford no warrant for the conclusion that man existed in the United States before the end of the glacial period. Whatever theoretical reasons there may be for assuming his earlier existence, they must be held as warranting no more than a presumptive conclusion, which up to the present time lacks confirmation by certain evidence.

The following sections from selected parts of the country give some idea of the succession of beds in various type regions. The thicknesses, especially where the formations are metamorphosed, are uncertain.

West Central Massachusetts

Triassic.	
Chicopee shale	200 ft. (?)
Granby tuff	580 ,,
Blackrock diabase (cones and dikes).	
Longmeadow sandstone	1000 ,,
Sugarloaf arkose	4660 ,,
Mount Toby conglomerate.	
Unconformity.	
Devonian.	
Bernardston series	1950 ft.
Unconformity.	
Silurian.	
Leyden argillite	300 ft.
Conway schist	} 5000 ,, (?)
Amherst schist	
Brinfield fibrolite-schist	
Goshen schist	2000 ,, (?)
Unconformity.	
Ordovician.	
Hawley schist	2000 ft. (?)
Savoy schist	5000 ,, (?)
Chester amphibolite	3000 ,, (?)
Rowe schist	4000 ,, (?)
Hoosic schist	1500 ,, (?)
Unconformity.	
Cambrian.	
Becket gneiss	2000 ft.(?)
Unconformity.	
Proterozoic.	
Washington gneiss	2000 ft.(?)
(Base not exposed.)	

The above section is fairly representative for considerable parts of New England.

West Virginia, &c.

Pennsylvanian.	
(Top of system removed by erosion.)	
Braxton formation	700 ft.
Upshur sandstone	300– 500 ,,
Pugh formation	300– 450 ,,
Pickens sandstone	400– 500 ,,
Unconformity.	
Mississippian.	
Canaan formation	1000–1300 ft.
Greenbrier limestone	350– 400 ,,
Pocono sandstone	70– 90 ,,
Devonian.	
Hampshire formation	1500–1800 ft.
Jennings formation	3000–3800 ,,
Romney shale	1000–1300 ,,
Unconformity.	
Monterey sandstone	50– 200 ft.
Silurian.	
Lewiston limestone	550–1050 ft.
Rockwood formation	100– 800 ,,
Cacapon sandstone	100– 630 ,,
Tuscarora quartzite	30– 300 ,,
Juniata formation	205–1250 ,,
Ordovician.	
Martinsburg shale	800–1800 ft.
Middle and Upper Cambrian.	
Shenandoah limestone	2400 ft.
(Base not exposed.)	

This section is fairly representative for the Appalachian Mountain tract, though the Cambrian is often more fully represented.

Ohio

Permian.	
Dunkard formation	*c.* 25 ft.
Pennsylvanian.	
Monongahela formation	200– 250 ft.
Conemaugh formation	400– 500 ,,
Alleghany formation	165– 300 ,,
Pottsville conglomerate	250 ,,
Unconformity.	
Mississippian.	
Maxville limestone	*c.* 25 ft.
Waverley series—	
Logan group	100– 150 ft.
Black Hand conglomerate	50– 500 ,,
Cuyahoga shale	150– 300 ,,
Sunbury shale	5– 30 ,,
Berea grit	5– 175 ,,
Bedford shale	50– 150 ,,
Devonian.	
Ohio shale	300–2600 ft.
Olentangy shale	20– 35 ,,
Delaware limestone	30– 40 ,,
Columbus limestone	110 ,,
Silurian.	
Monroe formation	50– 600 ft.
Niagara group	150– 350 ,,
Clinton limestone	10– 50 ,,
Medina shales (?)	50– 150 ,,
(Belfast bed.)	

Ordovician.	
Saluda beds	20± ft.
Richmond formation	300± ,,
Lorraine formation	300± ,,
Eden (Utica) shale	250 ,,
Trenton limestone	130 ,,

Iowa

Glacial drift.	
Unconformity.	
Upper Cretaceous.	
Benton formation	0– 150 ft.
Dakota formation	50– 100 ,,
Unconformity.	
Pennsylvanian.	
Missouri formation	1500 ft.
Des Moines formation	250– 400 ,,
Unconformity.	
Mississippian.	
St Louis limestone	100 ft.
Osage (Augusta) formation	200– 300 ,,
Kinderhook formation	150– 200 ,,
Devonian.	
Lime Creek formation	80 ft.
State Quarry beds	20– 40 ,,
Sweetland Creek shales	20– 40 ,,
Unconformity.	
Cedar Valley limestone	250– 300 ft.
Wapsipinicon formation (Independence, Fayette, Davenport)	100– 150 ,,
Silurian.	
Anamosa limestone	50– 75 ft.
Le Claire limestone	50 ,,
Delaware stage	200 ,,
Unconformity.	
Ordovician.	
Maquoketa shales	175 ft.
Possible Unconformity.	
Galena-Trenton limestone	290 ft.
St Peters sandstone	100 ,,
Oneota formation (includes Shakopee, New Richmond and Oneota proper)	300 ,,
Cambrian.	
St Croix sandstone (=Potsdam)	1000 ft.
Unconformity.	
Proterozoic.	
Sioux quartzite	(?)

This section is fairly representative for much of the central Mississippi Basin.

Oklahoma

Pennsylvanian.	
(Summit removed by erosion.)	
Seminole conglomerate	50 ft.
Holdenville shale	260 ,,
Wewaka formation	700 ,,
Wetumka shale	120 ,,
Calvin sandstone	145– 240 ,,
Senora formation	140– 485 ,,
Stuart shale	90– 280 ,,
Thurman sandstone	80– 260 ,,
Boggy shale	2000–2600 ,,
Savannah sandstone	750–1100 ,,
McAlester shale	1150–1500 ,,
Hartshorne sandstone	150– 200 ,,
Atoka formation (Chickahoc chert lentil)	3200 ,,
Wapanucka limestone	100– 150 ,,
Mississippian.	
Caney shale	1500 ft.
Devonian.	
Woodford chert	600 ft.
Silurian.	
Hunton limestone	160 ft.
Sylvan shale (upper part)	50– 100 ,,
Ordovician.	
Sylvan shale (lower part)	250 ft.
Viola limestone	750 ,,
Simpson series	1600 ,,
Arbuckle limestone	4000–6000 ,,
Cambrian.	
Regan sandstone	50– 100 ft.
Unconformity.	
Pre-Cambrian.	
Tishomingo granite	(?)

Composite section. The upper part is taken from vicinity of Coalgate, the lower part from the vicinity of Atoka.

West Central Colorado

Eocene or later.	
West Elk breccia	3000 ft.
Unconformity.	
Cretaceous.	
Ruby formation	2500 ft.
Unconformity.	
Ohio formation (local only)	200 ft.
Unconformity.	
Laramie formation	2000 ft.
Montana formation	2800 ,,
Niobrara formation	100– 200 ,,
Benton formation	150– 300 ,,
Dakota formation	40– 300 ,,
Jurassic.	
Gunnison formation	350– 500 ft.
Unconformity.	
Pennsylvanian.	
Maroon conglomerate	4500 ft.
Possible unconformity.	
Weber limestone	100– 550 ft.
Unconformity.	
Mississippian.	
Leadville limestone	400– 525 ft.
Apparent unconformity.	
Ordovician.	
Yule limestone	350– 450 ft.
Upper Cambrian.	
Sawatch quartzite	50– 350 ft.
Unconformity.	
Archean.	

The Bighorn Mountains of Wyoming

Cretaceous.	
De Smet formation (shale and sandstone)	4000 ft.
Kingsbury conglomerate	0–1500 ,,
Piney formation (shale and sandstone)	2500 ,,
Parkman sandstone	350 ,,
Pierre shale	1500–3500 ,,
Colorado formation	1050–1700 ,,
Comanchean.	
Cloverly formation (upper part may be Cretaceous)	30– 300 ft.
Morrison formation (may be Jurassic)	100– 300 ,,
Jurassic.	
Sundance formation	250– 350 ft.
Unconformity.	
Triassic and Permian.	
Chugwater formation	750–1200 ft.
Pennsylvanian.	
Tensleep sandstone	30– 150 ft.
Amsden sandstone	150– 350 ,,
Mississippian.	
Madison limestone	1000 ft.
Unconformity.	
Ordovician.	
Bighorn limestone	300 ft.
Unconformity.	
Cambrian (Upper).	
Deadwood formation	900 ft.
Unconformity.	
Pre-Cambrian.	
Granites.	

This section is fairly representative for the Rocky Mountains.

Southern California

Quaternary.	
Alluvium, &c.	
Terrace deposits and dune sand.	
Pliocene (?)	
Paso Robles formation	1000+ft.
Unconformity.	
Miocene (?)	
Pismo formation (in south part of area)	3000±ft.
Santa Margarita (in north part of area)	1550± ,,
Unconformity.	
Miocene.	
Monterey shale	5000–7000 ft.
Vaquero sandstone	0– 500 ,,
Unconformity.	
Cretaceous.	
Atascadero formation	3000–4000 ft.
Unconformity.	
Comanchean.	
Toro formation (Knoxville)	3000± ft.
Unconformity.	

Jura-Trias.
San Luis formation (Franciscan) . . . 1000± ft.
Unconformity.
Granite—age undetermined.
This section is representative of the southern Pacific coast.

SECTION IN CENTRAL WASHINGTON

Pliocene (?).	
Howson andesite	250 ft.
Miocene.	
Keechelus andesite series	4000 ft.
Unconformity.	
Guye formation (sedimentary beds with some lava flows)	3500± ft.
Eocene.	
Roslyn formation (sandstone and shale; coal)	*c.* 3000 ft.
Teanaway basalt	4000 „
Kachess rhyolite	0–2000 „
Swauk formation (clastic rocks with some tuff, &c.)	200–5000 „
Unconformity.	
Pre-Tertiary.	
Igneous and metamorphic rocks.	

This section is representative of the north-west part of the country.

BIBLIOGRAPHY.—A detailed bibliography for North American geology from 1732 to 1891, inclusive, is given in U.S. Geological Survey *Bulletin 127* (1896); for 1892–1900 in *Bulletin 188* (1902); for 1901–1905 in *Bull. 301* (1906); for 1906–1907 in *Bull. 372* (1909); for 1908 in *Bull. 409* (1909), &c. A few of the more important and available publications are enumerated below.

General Treatises.—T. C. Chamberlin and R. D. Salisbury, *Geologic Processes* (New York) and *Earth History* (2 vols., New York); J. D. Dana, *Manual of Geology* (New York, 1862); W. B. Scott, *Introduction to Geology* (New York, 1897); and Joseph Le Conte, *Elements of Geology* (New York, 1878).

Official Reports.—F. V. Hayden, *Reports of the U.S. Geological and Geographical Survey of the Territories* (12 vols., Washington, 1873–1883); Clarence King, *Geological Exploration of the Fortieth Parallel* (7 vols. and atlas, Washington, 1870–1880); George M. Wheeler, *Geographical and Geological Exploration and Surveys West of the 100th Meridian* (7 vols. and 2 atlases, Washington, 1877–1879); and *Reports of the U.S. Geological Survey* (since 1880): (1) Monographs on special topics and areas, about 50 in number; (2) Professional Papers—monographic treatment of somewhat smaller areas and lesser topics, about 60 in number; (3) Bulletins, between 300 and 400 in number; and (4) Annual Reports (previous to 1903) containing many papers of importance, of the sort now published as Professional Papers. Reports of state geological surveys have been published by most of the states east of the Missouri river, and some of those farther west (California, Washington, Kansas, Nebraska and Wyoming) and south (Arkansas, Texas and Louisiana). Among the more important periodicals are the *Bulletin of the Geological Society of America* (Rochester, N.Y., 1889 seq.); the *American Journal of Science* (New Haven, Conn., 1818 seq.); the *American Geologist* (Minneapolis, 1888 seq.); *Journal of Geology* (Chicago, 1893 seq.); *Economic Geology* (Lancaster, Pa., 1905 seq.). Occasional articles of value are to be found in the *American Naturalist* and *Science*, and in the *Transactions* and *Proceedings* of various state and municipal academies of science, societies, &c. (R. D. S.; T. C. C.)

III.—CLIMATE

The chief features of the climate of the United States may be best apprehended by relating them to the causes by which they are controlled. Two leading features, from which many others follow, are the intermediate value of the mean annual temperatures and the prevalence of westerly winds, with which drift the areas of high and low pressure—cyclonic and anticyclonic areas—controlling the short-lived, non-periodic weather changes. The first of these features is determined by the intermediate position of the United States between the equator and the north pole; the second by the equatorial-polar temperature contrast and the eastward rotation of the planet. Next, dependent on the inclination of the earth's axis, is the division of the planetary year into the terrestrial seasons, with winter and summer changes of temperature, wind-strength and precipitation; these seasonal changes are not of the restrained measure that is characteristic of the oceanic southern temperate zone, but of the exaggerated measure appropriate to the continental interruptions of the northern land-and-water zone, to which the term "temperate" is so generally inapplicable. The effects of the continent are already visible in the mean annual temperatures, in which the poleward temperature gradient is about twice as strong as it is on the neighbouring oceans; this being a natural effect of the immobility of the land surface, in contrast to the circulatory movement of the ocean currents, which thus lessen the temperature differences due to latitude: on the continent such differences are developed in full force. Closely associated with the effect of continental immobility are the effects dependent on the low specific heat and the opacity of the lands, in contrast with the high specific heat and partial transparence of the ocean waters. In virtue of these physical characteristics, the air over the land becomes much warmer in summer and much colder in winter than the air over the oceans in corresponding latitudes; hence the seasonal changes of temperature in the central United States are strong; the high temperatures appropriate to the torrid zone advance northward to middle latitudes in summer, and the low temperatures appropriate to the Arctic regions descend almost to middle latitudes in winter. As a result, the isotherms of July are strongly convex poleward as they cross the United States, the isotherm of 70° sweeping up to the northern boundary in the north-west, and the heat equator leaping to the overheated deserts of the south-west, where the July mean is over 90°. Conversely, the isotherms of January are convex southward, with a monthly mean below 32° in the northern third of the interior, and of zero on the mid-northern boundary. The seasonal bending of the isotherms is, however, unsymmetrical for several reasons. The continent being interrupted on its eastern side by the Gulf of Mexico and Hudson Bay, with the Great Lakes between these two large water bodies, the northward bending of the July isotherms is most pronounced in the western part of the United States. Indeed the contrast between the moderate temperatures of the Pacific coast and the overheated areas of the next interior deserts is so great that the isotherms trend almost parallel to the coast, and are even "overturned" somewhat in southern California, where the most rapid increase of temperatures in July is found not by moving southward over the ocean toward the equator, but north-eastward over the land to the deserts of Nevada and Arizona. So strong is the displacement of the area of highest interior temperatures westward from the middle of the continent that the Gulf of California almost rivals the Red Sea as an ocean-arm under a desert-hot atmosphere. In the same midsummer month all the eastern half of the United States is included between the isotherms of 66° and 82°; the contrast between Lake Superior and the coast of the Gulf of Mexico, 1200 m. to the south, is not so great as between the coast of southern California and the desert 150 m. inland to the north-east. In January the northern water areas of the continent are frozen and snow-covered; Hudson Bay becomes unduly cold, and the greatest southward bending of the isotherms is somewhat east of the continental axis, with an extension of its effects out upon the Atlantic; but the southward bending isotherms are somewhat looped back about the unfrozen waters of the lower Great Lakes. In the midwinter month, it is the eastern half of the country that has strong temperature contrasts; the temperature gradients are twice as strong between New Orleans and Minneapolis as on the Pacific coast, and the contrast between Jacksonville, Fla., and Eastport, Me., is about the same as between San Diego, Cal., and the Aleutian Islands.

The strong changes of temperature with the seasons are indicated also by the distribution of summer maxima and winter minima; summer temperatures above 112° are known in the south-western deserts, and temperatures of 100° are sometimes carried far northward on the Great Plains by the "hot winds" nearly to the Canadian boundary; while in winter, temperatures of −40° occur along the mid-northern boundary and freezing winds sometimes sweep down to the border of the Gulf of Mexico. The temperature anomalies are also instructive: they rival those of Asia in value, though not in area, being from 15° to 20° above the mean of their latitude in the northern interior in summer, and as much below in winter. The same is almost true of the mean annual range (mean of July to mean of January), the states of the northern prairies and plains having a mean annual range of 70° and an extreme range of 135°. In this connexion the effect of the prevailing winds is very marked. The equalizing effects of a conservative ocean are brought upon the Pacific coast, where the climate is truly temperate, the mean annual range being only 10° or 12°, thus resembling western Europe; while the exaggerating effects of the continental interior are carried eastward to the Atlantic coast, where the mean annual range is 40° or 50°.

The prevailing winds respond to the stronger poleward temperature gradients of winter by rising to a higher velocity and a more frequent and severer cyclonic storminess; and to the weaker gradients of summer by relaxing to a lower velocity with fewer and weaker cyclonic storms; but furthermore the northern zone occupied by the prevailing westerlies expands as the winds strengthen in winter, and shrinks as they weaken in summer; thus the stormy westerlies, which impinge upon the north-western coast and give it plentiful rainfall all through the year, in winter reach southern California and sweep across part of the Gulf of Mexico and Florida; it is for this reason that southern California has a rainy winter season, and that the states bordering on the Gulf of Mexico are visited in winter by occasional intensified cold winds, inappropriate to their latitude. In summer the stormy westerly winds withdraw from these lower latitudes, which are then to be more associated with the trade winds. In California the effect of the strong equatorward turn of the summer winds is to produce a dry season; but in the states along the Gulf of Mexico and especially in Florida the withdrawal of the stormy westerlies in favour of the steadier trade winds (here turned somewhat toward the continental interior, as explained below) results in an increase of precipitation. The general winds also are much affected by the changes of pressure due to the strong continental changes of temperature. The warmed air of summer produces an area of low pressure in the west-central United States, which interrupts the belt of high pressure that planetary conditions alone would form around the earth about latitude 30°; hence there is a tendency of the summer winds to blow inward from the northern Pacific over the Cordilleras toward the continental centre, and from the trades of the torrid Atlantic up the Mississippi Valley; conversely in winter time, the cold air over the lands produces a large area of high pressure from which the winds tend to flow outward; thus repelling the westerly winds of the northern Pacific and greatly intensifying the outflow southward to the Gulf of Mexico and eastward to the Atlantic. As a result of these seasonal alternations of temperature and pressure there is something of a monsoon tendency developed in the winds of the Mississippi Valley, southerly inflowing winds prevailing in summer and northerly outflowing winds in winter; but the general tendency to inflow and outflow is greatly modified by the relief of the lands, to which we next turn.

The climatic effects of relief are seen directly in the ascent of the higher mountain ranges to altitudes where low temperatures prevail, thus preserving snow patches through the summer on the high summits (over 12,000 ft.) in the south, and maintaining snow-fields and moderate-sized glaciers on the ranges in the north. With this goes a general increase of precipitation with altitude, so that a good rainfall map would have its darker shades very generally along the mountain ranges. Thus the heaviest measured rainfall east of the Mississippi is on the southern Appalachians; while in the west, where observations are as yet few at high level stations, the occurrence of forests and pastures on the higher slopes of mountains which rise from desert plains clearly testifies to the same rule. The mountains also introduce controls over the local winds; diurnal warming in summer suffices to cause local ascending breezes which frequently become cloudy by the expansion of ascent, even to the point of forming local thunder showers which drift away as they grow and soon dissolve after leaving the parent mountain. Conversely, nocturnal cooling produces well-defined descending breezes which issue from the valley mouths, sometimes attaining an unpleasant strength toward midnight.

The mountains are of larger importance in obstructing and deflecting the course of the general winds. The Pacific ranges, standing transverse to the course of the prevailing westerlies near the Pacific Ocean, are of the greatest importance in this respect; it is largely by reason of the barrier that they form that the tempering effects of the Pacific winds are felt for so short a distance inland in winter, and that the heat centre is displaced in summer so far towards the western coast. The rainfall from the stromy westerly winds is largely deposited on the western slopes of the mountains near the Pacific coast, and arid or desert interior plains are thus found close to the great ocean. The descending winds on the eastern slopes of the ranges are frequently warm and dry, to the point of resembling the Föhn winds of the Alps; such winds are known in the Cordilleran region as Chinook winds. The ranges of the Rocky Mountains in their turn receive some rainfall from the passing winds, but it is only after the westerlies are reinforced by a moist indraft from the Gulf of Mexico and the Atlantic—the result of summer or of cyclonic inflow—that rainfall increases to a sufficient measure on the lower lands to support agriculture without irrigation. The region east of the Mississippi is singularly favoured in this way; for it receives a good amount of rainfall, well distributed through the year, and indeed is in this respect one of the largest regions in the temperate zones that are so well watered. The Great Plains are under correspondingly unfavourable conditions, for their scanty rainfall is of very variable amount. Along the transition belt between plains and prairies the climate is peculiarly trying as to rainfall; one series of five or ten years may have sufficient rainfall to enable the farmers to gather good crops; but the next series following may be so dry that the crops fail year after year.

The cyclonic inflows and anticyclonic outflows, so characteristic of the belt of westerly winds the world over, are very irregular in the Cordilleran region; but farther eastward they are typically developed by reason of the great extent of open country. Although of reduced strength in the summer, they still suffice to dominate weather changes; it is during the approach of a low pressure centre that hot southerly winds prevail; they sometimes reach so high a temperature as to wither and blight the grain crops; and it is almost exclusively in connexion with the cloudy areas near and south-east of these cyclonic centres that violent thunderstorms, with their occasional destructive whirling tornadoes, are formed. With the passing of the low pressure centre, the winds shift to west or north-west, the temperature falls, and all nature is relieved. In winter-time, the cyclonic and anticyclonic areas are of increased frequency and intensity; and it is partly for this reason that many meteorologists have been disposed to regard them as chiefly driven by the irregular flow of the westerly winds, rather than as due to convectional instability, which should have a maximum effect in summer. One of the best indications of actual winter weather, as apart from the arrival of winter by the calendar, is the development of cyclonic disturbances of such strength that the change from their warm, sirocco-like southerly inflow in front of their centre, to the "cold wave" of their rear produces non-periodic temperature changes strong enough to overcome the weakened diurnal temperature changes of the cold season, a relation which practically never occurs in summer time. A curious feature of the cyclonic storms is that, whether they cross the interior of the country near the northern or southern boundary or along an intermediate path, they converge towards New England as they pass on toward the Atlantic; and hence that the north-eastern part of the United States is subjected to especially numerous and strong weather changes. (W. M. D.)

IV.—Fauna and Flora

Fauna.—Differences of temperature have produced in North America seven transcontinental life-zones or areas characterized by relative uniformity of both fauna and flora; they are the Arctic, Hudsonian and Canadian, which are divisions of the Boreal Region; the Transition, Upper Austral and Lower Austral, which are divisions of the Austral Region, and the Tropical. The Arctic, Hudsonian and Canadian enter the United States from the north and the Tropical from the south; but the greater part of the United States is occupied by the Transition, Upper Austral and Lower Austral, and each of these is divided into eastern and western subzones by differences in the amount of moisture. The Arctic or Arctic-Alpine zone covers in the United States only the tops of a few mountains which extend above the limit of trees, such as Mt Katahdin in Maine, Mt Washington and neighbouring peaks in the White Mountains of New Hampshire, and the loftier peaks of the Rocky, Cascade and Sierra Nevada Mountains. The larger animals are rare on these mountain-tops and the areas are too small for a distinct fauna. The Hudsonian zone covers the upper slopes of the higher mountains of New England, New York and North Carolina and larger areas on the elevated slopes of the Rocky and Cascade Mountains; and on the western mountains it is the home of the mountain goat, mountain sheep, Alpine flying-squirrel, nutcracker, evening grosbeak and Townsend's solitaire. The Canadian zone crosses from Canada into northern and north-western Maine, northern and central New Hampshire, northern Michigan, and north-eastern Minnesota and North Dakota, covers the Green Mountains, most of the Adirondacks and Catskills, the higher slopes of the mountains in Pennsylvania, West Virginia, Virginia, western North Carolina and eastern Tennessee, the lower slopes of the northern Rocky and Cascade Mountains, the upper slopes of the southern Rocky and Sierra Nevada Mountains, and a strip along the Pacific coast as far south as Cape Mendocino, interrupted, however, by the Columbia Valley. Among its characteristic mammals and birds are the lynx, marten, porcupine, northern red squirrel, Belding's and Kennicott's ground squirrels, varying and snowshoe rabbits, northern jumping mouse, white-throated sparrow, Blackburnian warbler, Audubon warbler, olive-backed thrush, three-toed woodpecker, spruce grouse, and Canada jay; within this zone in the North-eastern states are a few moose and caribou, but farther north these animals are more characteristic of the Hudsonian zone. The Transition zone, in which the extreme southern limit of several boreal species overlaps the extreme northern limit of numerous austral species, is divided into an eastern humid or Alleghanian area, a western arid area, and a Pacific coast humid area. The Alleghanian area comprises most of the lowlands of New England. New York and Pennsylvania, the north-east corner of Ohio, most of the lower peninsula of Michigan, nearly all of Wisconsin, more than half of Minnesota, eastern North Dakota, north-eastern South Dakota, and the greater part of the Appalachian Mountains from Pennsylvania to Georgia. It has few distinctive species, but within its borders the southern mole and cotton-tail rabbit of the South meet the northern star-nosed and Brewer's moles and the varying hare of the North, and the southern bobwhite, Baltimore oriole, bluebird, catbird, chewink, thrasher and wood thrush are neighbours of the bobolink, solitary vireo and the hermit and Wilson's thrushes. The Arid Transition life-zone comprises the western part of the Dakotas, north-eastern Montana, and irregular areas in Washington, Oregon, Idaho, Wyoming, California, Nevada, Utah, Colorado, Arizona, New Mexico and western Texas, covering for the most part the eastern base of the Cascade and Sierra Nevada Mountains and the higher parts of the Great Basin and the plateaus. Its most characteristic animals and birds are the white-tailed jack-rabbit, pallid vole, sage hen, sharp-tailed grouse and green-tailed towhee; the large Columbia ground-squirrel (*Spermophilus columbianus*) is common in that part of the zone which is west of the Rocky Mountains, but east of the Rockies it is replaced by another species (*Cynomys*) which closely resembles a small prairie dog. The Pacific Coast Transition life-zone comprises the region between the Cascade and Coast ranges in Washington and Oregon, parts of northern California,, and most of the California coast region from Cape Mendocino to Santa Barbara. It is the home of the Columbia black-tail deer, western raccoon, Oregon spotted skunk, Douglas red squirrel, Townsend's chipmunk, tailless sewellel (*Haplodon rufus*), peculiar species of pocket gophers and voles, Pacific coast forms of the great-horned, spotted, screech and pigmy owls, sooty grouse, Oregon ruffed grouse, Steller's jay, chestnut-backed chickadee and Pacific winter wren. The Upper Austral zone is divided into an eastern humid (or Carolinian) area and a western arid (or Upper Sonoran) area. The Carolinian area extends from southern Michigan to northern Georgia and from the Atlantic coast to western Kansas, comprising Delaware, all of Maryland except the mountainous western portion, all of Ohio except the north-east corner, nearly the whole of Indiana, Illinois, Iowa and Missouri, eastern Nebraska and Kansas, south-eastern South Dakota, western central Oklahoma, northern Arkansas, middle and eastern Kentucky, middle Tennessee and the Tennessee valley in eastern Tennessee, middle Virginia and North Carolina, western West Virginia, north-eastern Alabama, northern Georgia, western South Carolina, the Connecticut Valley in Connecticut, the lower Hudson Valley and the Erie basin in New York, and narrow belts along the southern and western borders of the lower peninsula of Michigan. It is the northernmost home of the opossum, grey fox, fox squirrel, cardinal bird, Carolina wren, tufted tit, gnat catcher, summer tanager and yellow-breasted chat. The Upper Sonoran life-zone comprises south-eastern Montana, central, eastern and north-eastern Wyoming, a portion of south-western South Dakota, western Nebraska and Kansas, the western extremity of Oklahoma, north-western Texas, eastern Colorado, south-eastern New Mexico, the Snake plains in Idaho, the Columbia plains in Washington, the Malheur and Harney plains in Oregon, the Great Salt Lake and Sevier deserts in Utah, and narrow belts in California, Nevada and Arizona. Among its characteristic mammals and birds are the sage cotton-tail, black-tailed jack-rabbit, Idaho rabbit, Oregon, Utah and Townsend's ground squirrels, sage chipmunk, five-toed kangaroo rats, pocket mice, grasshopper mice, burrowing owl, Brewer's sparrow, Nevada sage sparrow, lazuli finch, sage thrasher, Nuttall's poor-will, Bullock's oriole and rough-winged swallow. The Lower Austral zone occupies the greater part of the Southern states, and is divided near the 98th meridian into an eastern humid or Austroriparian area and a western arid or Lower Sonoran area. The Austroriparian zone comprises nearly all the Gulf States as far west as the mouth of the Rio Grande, the greater part of Georgia, eastern South Carolina, North Carolina and Virginia, and extends up the lowlands of the Mississippi Valley across western Tennessee and Kentucky into southern Illinois and Indiana and across eastern and southern Arkansas and eastern Oklahoma into south-eastern Missouri and Kansas. It is the home of the southern fox-squirrel, cotton rat, ricefield rat, wood rat, free-tailed bat, mocking bird, painted bunting, prothonotary warbler, red-cockaded woodpecker, chuckwill's-widow, and the swallow-tailed and Mississippi kites. A southern portion of this zone, comprising a narrow strip along the Gulf Coast from Texas to Florida and up the Atlantic coast to South Carolina, is semi-tropical, and is the northernmost habitation of several small mammals, the alligator (*Alligator mississippiensis*), the ground dove, white-tailed kite, Florida screech owl and Chapman's night-hawk. The Lower Sonoran zone comprises the most arid parts of the United States: south-western Texas, south-western Arizona and a portion of northern Arizona, southern Nevada and a large part of southern California. Some of its characteristic mammals and birds are the long-eared desert fox, four-toed kangaroo rats, Sonoran pocket mice, big-eared and tiny white-haired bats, road runner, cactus wren, canyon wren, desert thrashers, hooded oriole, black-throated desert sparrow, Texas night-hawk and Gambel's quail. It is the northernmost home of the armadillo, ocelot, jaguar, red and grey cats, and the spiny pocket mouse, and in southern Texas especially it is visited by several species of tropical birds. There is some resemblance to the Tropical life-zone at the south-eastern extremity of Texas, but this zone in the United States is properly restricted to southern Florida and the lower valley of the Colorado along the border of California and Arizona, and the knowledge of the latter is very imperfect. The area in Florida is too small for characteristic tropical mammals, but it has the true crocodile (*Crocodilus americanus*) and is the home of a few tropical birds. Most of the larger American mammals are not restricted to any one faunal zone. The bison, although now nearly extinct, formerly roamed over nearly the entire region between the Appalachian and the Rocky Mountains. The black bear and beaver were also widely distributed. The Virginia deer still ranges from Maine to the Gulf states and from the Atlantic coast to the Rocky Mountains. The grizzly bear, cougar, coyote, prairie dog and antelope are still found in several of the Western states, and the grey wolf is common in the West and in northern Minnesota, Wisconsin and Michigan.

Flora.—The Alpine flora, which is found in the United States only on the tops of those mountains which rise above the limit of trees, consists principally of a variety of plants which bloom as soon as the snow melts and for a short season make a brilliant display of colours. The flora of the Hudsonian and the Canadian zone consists largely of white and black spruce, tamarack, canoe-birch, balsam-poplar, balsam-fir, aspen and grey pine. In the Alleghanian Transition zone the chestnut, walnut, oaks and hickories of the South are interspersed among the beech, birch, hemlock and sugar maple of the North. In the Western Arid Transition zone the flora consists largely of the true sage brush (*Artemisia tridentata*), but some tracts are covered with forests of yellow or bull pine (*Pinus ponderosa*). The Pacific coast Transition zone is noted for its forests of giant conifers, principally Douglas fir, Sitka spruce, Pacific cedar and Western hemlock. Here, too, mosses and ferns grow in profusion, and the *sadal* (*Gaultheria shallon*), thimble berry (*Rubus nootkamus*), salmon berry (*Rubus spectabilis*) and devil's club (*Fatsia horrida*) are characteristic shrubs. In the Carolinian zone the tulip tree, sycamore, sweet gum, rose magnolia, short-leaf pine and sassafras find their northernmost limit Sage brush is common to both the western arid Transition zone and the Upper Sonoran zone, but in suitable soils of the latter several greasewoods (*Artiplex confertifolia*, *A. canescens*, *A. nuttalli*, *Tetradymia canescens*, *Sarcobatus vermiculatus* and *Grayia spinosa*) are characteristic species, and on the mountain slopes are some nut pines (*piñon*) and junipers. The Austroriparian zone has the long-leaf and loblolly pines, magnolia and live oak on the uplands, and the bald cypress, tupelo and cane in the swamps; and in the semi-tropical Gulf strip are the cabbage palmetto and Cuban pine; here, too, Sea Island cotton and tropical fruits are successfully cultivated. The Lower Sonoran zone is noted for its cactuses, of which there is a great variety, and some of them grow to the height of trees; the mesquite is also very large, and the creosote bush, acacias, yuccas and agaves are common. The Tropical belt of southern Florida has the royal palm, coco-nut palm, banana, Jamaica dogwood, manchineel and mangrove; the Tropical belt in the lower valley of the Colorado has giant cactuses, desert acacias, palo-verdes and the Washington or fan-leaf palm. Almost all of the United States east of the 98th meridian is naturally a forest region, and forests cover the greater part of the Rocky Mountains, the Cascades, the Sierra Nevadas and the Coast Range, but throughout the belt of plains, basins and deserts west of the Rocky Mountains and on the Great Plains east of the Rocky Mountains there are few trees except along the watercourses, and the prevailing type of vegetation ranges from bunch grass to sage brush and cactuses according to the degree of aridity and the temperature. In the eastern forest region the number of species decreases somewhat from south to north, but the entire region differs from the densely forested region of the Pacific Coast Transition zone in that it is essentially a region of deciduous or hardwood forests, while the latter is essentially one of coniferous trees; it differs from the forested region of the Rocky Mountains in that the latter is not only essentially a region of coniferous trees, but one where the forests do not by any means occupy the whole area, neither do they approach in density or economic importance those of the eastern division of the country. Again, the forests of most of the eastern region embrace a variety of species, which, as a rule, are very much intermingled, and do not, unless quite exceptionally, occupy areas chiefly devoted to one species; while, on the other hand, the forests of the west—including both Rocky Mountain and Pacific coast divisions—exhibit a small number of species, considering the vast area embraced in the region; and these species, in a number of instances, are extraordinarily limited in their range, although there are cases in which one or two species have almost exclusive possession of extensive areas.

V.—POPULATION AND SOCIAL CONDITIONS

Geographical Growth of the Nation.—The achievement of independence found the people of the United States owning the entire country between the Gulf and the Great Lakes, excepting only Florida, as far to the west as the Mississippi; but the actual settlements were, with a few minor exceptions, confined to a strip of territory along the Atlantic shore. The depth of settlement, from the coast inland, varied greatly, ranging from what would be involved in the mere occupation of the shore for fishing purposes to a body of agricultural occupation extending back to the base of the great Atlantic chain, and averaged some 250 m.[1]

Westward, beyond the general line of continuous settlement,

[1] In the *Statistical Atlas* volume of the census of 1900 the reader will find for each decennial census since 1790 a map showing the distribution of population, with indication of the density of settlement, and an elaborate explanatory text. In Orin Grant Libby's *Geographical Distribution of the Vote of the Thirteen States on the Federal Constitution, 1787–1788* (University of Wisconsin, Madison, 1894), along with a valuable map interesting facts are given regarding the social and economic characteristics of different sections.

were four extensions of population through as many gaps in the Appalachian barrier, constituting the four main paths along which migration westward first took place: the Mohawk Valley in New York, the upper Potomac, the Appalachian Valley, and around the southern base of the Appalachian system. Four outlying groups beyond the mountains, with perhaps a twentieth part of the total population of the nation, —one about Pittsburg, one in West Virginia, another in northern Kentucky, and the last in Tennessee: all determined in situation by river highways—bore witness to the qualities of strength and courage of the American pioneer. Finally, there were in 1790 about a score of small trading or military posts, mainly of French origin, scattered over the then almost unbroken wilderness of the upper Mississippi Valley and region of the Great Lakes.

Twelve decennial censuses taken since that time (1800–1910) have revealed the extraordinary spread of population over the present area of the country (see CENSUS: *United States*). The large percentage of the population, particularly 110 years moved more than 500 m westward, almost exactly along the 39th parallel of latitude: 9·5 degrees of longitude, with an extreme variation of less than 19 minutes of latitude.

Growth of the Nation in Population.—If the 19th century was remarkable with respect to national and urban growth the world over, it was particularly so in the growth of the United States. Malthus expressed the opinion that only in such a land of unlimited means of living could population freely increase. The total population increased from 1800 to 1900 about fourteen fold (1331·6%).[1] The rate of growth indicated in 1900 was still double the average rate of western Europe.[2] In the whole world Argentina alone (1869–1895) showed equal (and greater) growth. At the opening of the century not only all the great European powers of to-day but also even Spain and Turkey exceeded the United States in numbers; at its close only Russia. At the census of 1910, while the continental United States population (excluding Alaska) was 91,972,266, the total, including Alaska, Hawaii and Porto Rico, but excluding the Philippine Islands, Guam, Samoa and the Canal Zone, was 93,402,151.

of the great urban centres, that is established to-day in the river lowlands, reflects the rôle that water highways have played in the peopling of the country. The dwindlings and growths of Nevada down to the present day, and to not a slight degree the general history of the settlement of the states of the Rocky Mountain region, are a commentary on the fate of mining industries. The initial settlement of the Pacific coast following the discovery of gold in California in 1848, and of the eastern base of the Rocky Mountains after the discovery of gold in 1859, illustrates the same factor. The Mormons settled Utah to insure social isolation, for the security of their theological system. A large part of the Great Plains to the east of the Rockies was taken up as farms in the decade 1880–1890; abandoned afterwards, because of its aridity, to stock grazing; and reconverted from ranches into farms when a system of dry farming had proved its tillage practicable. The negro more or less consciously moves, individually, closer into the areas whose climate and crops most nearly meet his desires and capabilities as a farmer; and his race as a whole unconsciously is adjusting its habitat to the boundaries of the Austroriparian life zone. The country's centre of population in

In 1790 there were about 600,000 white families in the United States. Speaking broadly, there were few very rich and few very poor. Food was abundant. Both social traditions and the religious beliefs of the people encouraged fecundity. The country enjoyed domestic tranquillity. All this time, too, the land was but partially settled. Mechanical labour was scarce, and even upon the farm it was difficult to command hired service, almost the only farm labourers down to 1850, in the north, being young men who went out to work for a few years to get a little money to marry upon. A change was probably inevitable and came, apparently, between 1840 and 1850.

The accessions in that decade from Ireland and Germany were enormous, the total immigration rising to 1,713,251 against 599,125 during the decade preceding, and against only 143,439 from 1820 to 1830. These people came in condition to breed with unprecedented rapidity, under the stimulus of an abundance,

[1] Unless otherwise explicitly stated, by "United States" is to be understood continental United States exclusive of Alaska.
[2] According to Lavasseur and Bodio, 14·5% from 1860 to 1880; 21·2% from 1880 to 1900; from 1886–1900, 11·0%.

in regard to food, shelter and clothing, such as the most fortunate of them had never known. Yet in spite of these accessions, the population of the country realized a slightly smaller proportion of gain than when the foreign arrivals were almost insignificant.

For a time the retardation of the normal rate of increase among the native population was concealed from view by the extraordinary immigration. In the decade 1850–1860 it was seen that almost a seventh of the population of the country consisted of persons born abroad. From 1840 to 1860 there came more than four million immigrants, of whom probably three and a half million, with probably as many children born in America, were living at the latter date.

The ten years from 1860 to 1870 witnessed the operation of the first great factor which reduced the rate of national increase, namely the Civil War. The superintendent of the Ninth Census, 1870, presented a computation of the effects of this cause—first, through direct losses, by wounds or disease, either in actual service of the army or navy, or in a brief term following discharge; secondly, through the retardation of the rate of increase in the coloured element, due to the privations, exposures and excesses attendant upon emancipation; thirdly, through the check given to immigration by the existence of war, the fear of conscription, and the apprehension abroad of results prejudicial to the national welfare. The aggregate effect of all these causes was estimated as a loss to the population of 1870 of 1,765,000. Finally, the temporary reduction of the birth-rate, consequent upon the withdrawal of perhaps one-fourth of the national militia (males of 18 to 44 years) during two-fifths of the decade, may be estimated at perhaps 750,000.

The Tenth Census put it beyond doubt that economic and social forces had been at work, reducing the rate of multiplication. Yet no war had intervened; the industries of the land had flourished; the advance in accumulated wealth had been beyond all precedent; and immigration had increased.

It is an interesting question what has been the contribution of the foreign elements of the country's population in the growth of the aggregate. This question is closely connected with a still more important one: namely, what effect, if any, has foreign immigration had upon the birth-rate of the native stock. In 1850 the foreign-born whites (2,244,602 in number) were about two-thirds of the coloured element and one-eighth of the native-white element; in 1870 the foreign-born whites (5,567,229) and the native whites of foreign parentage (5,324,786) each exceeded the coloured. In 1900 the two foreign elements constituted one-third of the total population. The absolute numbers of the four elements were: native whites of native parents, 40,949,362; natives of foreign parents, 15,646,017; foreign-born whites, 10,213,817; coloured, 8,833,994.

Separating from the total population of the country in 1900 the non-Caucasians (9,185,379), all white persons having both parents foreign (20,803,800), and one-half (2,541,365) of the number of persons having only one parent foreign, the remaining 43,555,250 "native" inhabitants comprised the descendants of the Americans of 1790, plus those of the few inhabitants of annexed territories, plus those in the third and higher generations of the foreigners who entered the country after 1790 (or for practical purposes, after 1800). The second element may be disregarded. For the exact determination of the last element the census affords no precise data, but affords material for various approximations, based either upon the elimination of the probable progeny of immigrants since 1790; on the known increase of the whites of the South, where the foreign element has always been relatively insignificant; on the percentage of natives having native grandfathers in Massachusetts in 1905; or upon the assumed continuance through the 19th century of the rate of native growth (one-third decennially) known to have prevailed down at least to 1820. The last is the roughest approximation and would indicate a native mass of 50,000,000 in 1900, or a foreign contribution of approximately half. The results of computations by the first two methods yield estimates of the contribution of foreign stock to the "native" element of 1900 varying among themselves by only 1·8%. The average by the three methods gives 8,539,626 as such contribution, making 31,884,791 the total number of whites of foreign origin in 1900; and this leaves 35,015,624 as the progeny of the original stock of 1790.[1] Adding to the true native whites of 1900 (35,015,624) the native negroes (8,813,658), the increase of the native stock, white and black, since 1790 would thus be about 1091%, and of the whites of 1790 (3,172,006) alone about 1104%. It is evident that had the fecundity of the American stock of 1790 been equal only to that of Belgium (the most fertile population of western Europe in the 19th century) then the additions of foreign elements to the American people would have been by 1900 in heavy preponderance over the original, mainly British, elements. A study of the family names appearing on the census rolls of two prosperous and typical American counties, one distinctively urban and the other rural, in 1790 and 1900, has confirmed the popular impression that the British element is growing little, and that the fastest reproducers to-day are the foreign elements that have become large in the immigration current in very recent decades. In applying to the total population of 1790 the rate of growth shown since 1790 by the white people of the South, this rate, for the purpose of the above computations, is taken in its entirety only up to 1870, and thereafter—in view of the notorious lesser birth-rate since that year in the North and West—only one half of the rate is used. If, however, application be made of the rate in its entirety from 1790 to 1900, the result would be a theoretical pure native stock in 1900 equal to the then actually existing native and foreign stock combined.

In 1900 more than half of every 100 whites in New England and the Middle states (from New York to Maryland) were of foreign parentage (*i.e.* had one or both parents foreign), and in both sections the proportion is increasing with great rapidity. The Southern states, on the other hand, have shown a diminishing relative foreign element since 1870, and had in 1900 only 79 of foreign parentage in 1000 whites. Relatively to their share of the country's aggregate population the North Atlantic states, and those upon the Great Lakes—the manufacturing and urbanized states of the Union—hold much the heaviest share of immigrant population.

The shares of different nationalities in the aggregate mass of foreigners have varied greatly. The family names on the registers of the first census show that more than 90% of the white population was then of British stock, and more than 80 was English. The Germans were already near 6%. The entry of the Irish began on a great scale after 1840, and in 1850 they formed nearly half of all the foreign-born. In that year 85·6% of this total was made up by natives of Great Britain and Germany. The latter took first place in 1880. In 1900 these two countries represented of the total only 52·7%; add the Dutch, the Danes, Swedes, Norwegians and Swiss to the latter and the share was 65·1%. A great majority of all of these elements except the British are settled in the states added to the original Union—the Scandinavians being the most typically agricultural element; while almost all the other nationalities are in excess, most of them heavily so, in the original states of 1790, where they land, and where they are absorbed into the lower grades of the industrial organization. Since 1880 Italians, Russians, Poles, Austrians, Bohemians and Hungarians have enormously increased in the immigrant population. Germans, Irish, British, Canadians, Scandinavians, Slavs and Italians were the leading elements in 1900.

In 1790 the negroes were 19·3% of the country's inhabitants; in 1900 only 11·6%. While the growth of the country's aggregate population from 1790 to 1900 was 1833·9%, that of the whites was 2005·9%, and of the negroes only 1066·7%.

Certain generalizations respecting the "South" and the "North," the "East" and the "West" are essential to an understanding of parts of the history of the past, and of social conditions in the present. For the basis of such comparisons the country is divided by the census into five groups of states: (1) the North Atlantic division—down to New Jersey and Pennsylvania; (2) the South Atlantic division—from Delaware to Florida (including West Virginia); (3) the North Central division—including the states within a triangle tipped by Ohio, Kansas and North Dakota; (4) the South Central division—covering a triangle tipped by Kentucky, Alabama and Texas; and (5) the Western division—including the Rocky Mountains and Pacific states. The first and third lead to-day in manufacturing interests; the third in agricultural; the fifth in mining.

Groups 1 and 3 (with the western boundary somewhat indefinite) are colloquially known as the "North" and 2 and 4 as the "South." The two sections started out with population growths in the decade 1790–1800 very nearly equal (36·5 and 33·7%); but in every succeeding decade before the Civil War the growth of the North was greater, and that of the South less, than its increment in the initial decade. In the two twenty-year periods after 1860 the increases of the North were 61·9 and 48·7%; of the South, 48·4 and 48·5%. In 1790 the two sections were of almost equal population; in 1890, 1900 and 1910 the population of the North was practically double that of the South. In the decade 1890–1900 the increase of the South exceeded slightly that of the North for the same period owing to the rapid development in recent years of the Southern states west of the Mississippi, which only the Western group has exceeded since 1870.[2] In general the increase of the two sections

[1] W. S. Rossiter, *A Century of Population Growth* (Bureau of the Census, Washington, 1909), pp. 85 seq.

[2] The number of inhabitants of the North at each census for every 1000 in the South was as follows from 1790 to 1900: 1004; 1025; 1092; 1181; 1253; 1455; 1562; 1769; 2057; 1930; 2005; 1932.

since 1880 has been nearly equal. But while this growth was relatively uniform over the South, in the North there was a low (often a decreasing) rate of rural and a high rate of urban growth. Throughout the 19th century the rates of growth of the North Central division and that of the eastern half of the South Central division steadily decreased. It is notable that that of the South Atlantic group has grown faster since 1860 than ever before, despite the Civil War and the conditions of an old settled region: a fact possibly due to the effects of the emancipation of the slaves.

Comparing now the population of the regions east and west of the Mississippi, we find that the population of the first had grown from 3,929,214 in 1790 to 55,023,513 in 1900; and that of the second from 97,401 in 1810 to 20,971,062 in 1900. From 1860 to 1890 the one increased its numbers decennially by one half, and the other by under one fifth; but from 1890 to 1910 the difference in growth was slight, owing to a tremendous falling off in the rate of growth of much of the Western and the western states of the North Central divisions. Only an eighth of the country's total population lived in 1900 west of the 96th meridian, which divides the country into two nearly equal parts. Although, as already stated, the population of the original area of 1790 was passed in 1880 by that of the added area, the natives of the former were still in excess in 1900.

Urban and Rural Population.—The five cities of the country that had 8000 or more inhabitants in 1790 had multiplied to 548 in 1900. Only one of the original six (Charleston) was in the true South, which was distinctly rural. The three leading colonial cities, Philadelphia, New York and Boston, grew six-fold in the 18th century, and fifty-fold in the next. The proportion of the population living in cities seems to have been practically constant throughout the 18th century and up to 1820. The great growth of urban centres has been a result of industrial expansion since that time. This growth has been irregular, but was at a maximum about the middle of the century. On an average throughout the 110 years, the population in cities of 8000 considerably more than doubled every twenty years.[1] The rate of rural growth, on the other hand, fell very slowly down to 1860,[2] and since then (disregarding the figures of the inaccurate census of 1870) has been steady at about half the former rate. In Rhode Island, in 1900, eight out of every ten persons lived in cities of 8000 or more inhabitants; in Massachusetts, seven in ten. In New York, New Jersey and Connecticut the city element also exceeded half of the population. At the other extreme, Mississippi had only 3% of urban citizens. If the limit be drawn at a population of 2500 (a truer division) the urban element of Rhode Island becomes 95·0%; of Massachusetts, 91·5; of Mississippi, 7·7. All the Southern states are still relatively rural, as well to-day as a hundred years ago. Ten states of the Union had a density in 1910 exceeding 100 persons to the square mile: Illinois (100·7), Delaware (103), Ohio (117), Maryland (130·3), Pennsylvania (171·3), New York (191·2), Connecticut (231·3), New Jersey (337·3), Massachusetts (418·8) and Rhode Island (508·5).

There are abundant statistical indications that the line (be the influence that draws it economic or social) between urban centres of only 2500 inhabitants and rural districts is much sharper to-day than was that between the country and cities of 8000 inhabitants (the largest had five times that number) in 1790. The lower limit is therefore a truer division line to-day. Classifying, then, as urban centres all of above 2500 inhabitants, three-tenths of the total population lived in the latter centres in 1880 and four-tenths (30,583,411) in 1900; their population doubled in these twenty years. If one regards the larger units, they held naturally a little more of the total population of the country—just a third (33·1%; ten times their proportion of the country's total in 1790); and they grew a little faster. The same years, however, made apparent a rapid fall, general and marked, yet possibly only temporary, in the rate at which such urban centres, as well as larger ones, had been gaining upon the rural districts; this reaction being most pronounced in the South and least so in the North Atlantic states, whose manufacturing industries are concentrated in dense centres of population.

Interstate migration is an interesting element in American national life. A fifth of the total population of 1900 were living in other states than those of birth; and this does not take account of temporary nor of multiple migration. Every state numbers among its residents natives of nearly every other state. This movement is complicated by that of foreign immigration. In 1900 the percentage of resident natives varied from 92·7% in South Carolina to 15% in Oklahoma; almost all of the Southern states having high percentages.

Sexes.—The percentages of males and females, of all ages, in the aggregate population of 1900, were 51·0 and 49·0 respectively. The corresponding figures for the main elements of the population were as follows: for native whites, 50·7 and 49·3; foreign whites, 54·0 and 46·0; negroes, 49·6 and 50·4. The absolute excess of males in the aggregate population has been progressively greater at every successive census since 1820, save that of 1870—which followed the Civil War, and closed a decade of lessened immigration. The relative excess of males in each unit of population has not constantly progressed, but has been continuous. In densely settled regions females generally predominate; and males in thinly settled regions. In every 1000 urban inhabitants there were, in 1900, 23 (in 1890 only 19) more females than in 1000 rural inhabitants. In the rural districts, so far as there is any excess of females, it is almost solely in the Southern cotton belt, where negro women are largely employed as farm hands.

Vital Statistics, 1900.—The median age of the aggregate population of 1900—that is, the age that divides the population into halves—was 22·85 years. In 1800 it was 15·97 years. A falling birth-rate, a falling death-rate, and the increase in the number of adult immigrants, are presumably the chief causes of this difference. The median age of the foreign-born in 1900 was 38·42 years. The median age of the population of cities of 25,000 or more inhabitants was 3·55 years greater than that of the inhabitants of smaller urban centres and rural districts, owing probably in the main to the movement of middle-aged native and foreign adults to urban centres, and the higher birth-rate of the rural districts. The median age of the aggregate population is highest in New England and the Pacific states, lowest in the South, and in the North Central about equal to the country's average. The average age of the country's population in 1900 was 26·2 years. The United States had a larger proportion (59·1%) within the "productive" age limits of 15 and 60 years than most European countries; this being due to the immigration of foreign adults (corresponding figure 80·3%), the productive group among the native whites (55·8%) being smaller than in every country of Europe. The same is true, however, of the population over 60 years of age.

Death-rate. The death-rate of the United States, though incapable of exact determination, was probably between 16 and 17 per 1000 in 1900; and therefore less than in most foreign countries. The following statement of the leading causes of death during the eleven years 1890–1900 in 83 cities of above 25,000 population, is given by Dr J. S. Billings:—

Average Annual Death-rate per 100,000 Population for the Cities of the Sections Indicated.	Consumption.	Pneumonia.	Typhoid Fever.	Diphtheria and Croup.
New England	244	220	30	77
Middle states	259	268	32	101
Lake states	156	159	48	79
Southern states	277	189	50	54
West North Central	183	142	38	61

Marriage. Among the statistics of conjugal condition the most striking facts are that among the foreign-born the married are more than twice as numerous as the single, owing to the predominance of adults among the immigrants; and the native whites of foreign parents marry late and in much smaller proportion than do the native whites of native parentage—the explanation of which is probably to be found in the reaction of the first American generation caused on one hand by the high American standard of living, and on the other by the relative economic independence of women. In 1900 1·0% of the males and 10·9% of the females from 15 to 19 years of age were married; from 20 to 24 years, 21·6% and 46·5% respectively. Of females above 15 years of age 31·2% were single, 56·9 married, 11·2 widowed, 0·5 divorced; many of the last class undoubtedly reporting themselves as of the others. The corresponding figures for males were: 40·2, 54·5, 4·6 and 0·3%. In 1850 there were 5·6 persons (excluding the slave population) in an average American family; fifty years later there were only 4·7—a decline, which was constant, of 16·1%.

Families. In 1790, 5 persons was also the normal family—*i.e.* the greatest proportion (14%) of the total were of this size; but in 1900 the model family was that of 3 persons by a more decisive proportion (18%). The minimum state average of 1790, which was 5·4 in Georgia, was greater than the maximum of 1900. Within the area of 1790 there were twice as many families in 1900 as in 1790 consisting of 2 persons, and barely half as many consisting of 7 and upward; New England having shown the greatest and the South the least decrease. In 1790 about a third and in 1900 more than one half of all families had less than 5 members.

Birth-rate. The data gathered by the Federal census have never made possible a satisfactory and trustworthy calculation of the birth-rate, and state and local agencies possess no such data for any considerable area. But the evidence is on the whole cumulative and convincing that there was a remarkable falling off in the birth-rate during the 19th century. And it may be noted, because of its bearing upon the theory of General Francis A. Walker, that the Old South of 1790, practically unaided by immigration, maintained a rate of increase at least approximating that attained by other sections of the country by native and foreign stock combined. Not a state of the Union as it existed in 1850 showed an increase, during the half-century following, in the ratio of white children under 16 to 1000 white females over 16 years: the ratio declined for the whole country from 1600 to 1100; and it has fallen for the census area of 1790 from 1900 in that year to 1400 in 1850 and 1000 in 1900. On the other hand, elaborate colonial censuses for New York in 1703 and 1812 show

[1] Average 62·2% decennially. [2] Average 31·9% decennially.

Sections of the Country.[1]	Whites under 16 Years per 1000 of Total Population.				
	1790.	1820.	1850.	1880.	1900.
Area of 1790	490	483	414	373	344
New England	470	443	358	309	291
Middle states	494	485	405	358	326
Old South	502	508	464	431	402
Added area	—	526	463	406	368

ratios of 1900 and 2000, and reinforce the suggestions of various other facts that the social, as well as the economic, conditions in colonial times were practically constant.

The decline in the proportion of children since 1860 has been decidedly less in the South (Southern Atlantic and South Central states as defined below) than in the North and West, but in the most recent decades the last section has apparently fast followed New England in having a progressively lesser proportion of children. In the North there was little difference in 1900 in the ratios shown by city and country districts, but in the South the ratio in the latter was almost twice that reported for the former.

The decades 1840–1850, 1880–1890 and 1860–1870 have shown much the greatest decreases in the percentage of children; and some have attributed this to the alleged heavier immigration of foreigners (largely adults) in the case of the two former decades, and the effects of the Civil War in the third. So also the three decades immediately succeeding the above showed minimum decreases; and this has been attributed to a supposed greater birth-rate among the immigrants.

These uncertainties raise a greater one of much significance, viz. what has been the cause of the reduction in the national birth-rate indicated by the census figures? The question has been very differently judged. In the opinion of General Francis A. Walker, superintendent of the censuses of 1870 and 1880, the remarkable fact that such reduction coincided with a cause that was regarded as certain to quicken the increase of population, viz. the introduction of a vast body of fresh peasant blood from Europe, afforded proof that in this matter of population morals are far more potent than physical causes. The change, wrote General Walker, which produced this falling off from the traditional rate of increase of about 3% per annum, was that from the simplicity of the early times to comparative luxury; involving a rise in the standard of living, the multiplication of artificial necessities, the extension of a paid domestic service, the introduction of women into factory labour.[2] In his opinion the decline in the birth-rate coincidently with the increase of immigration, and chiefly in those regions where immigration was greatest, was no mere coincidence; nor was such immigrant invasion due to a weakening native increase, or economic defence; but the decline of the natives was the effect of the increase of the foreigners, which was "a shock to the principle of population among the native element." Immigration therefore, according to this theory, had "amounted not to a reinforcement of our population, but to a replacement of native by foreign stock. That if the foreigners had not come, the native element would long have filled the places the foreigners usurped, I entertain"—says General Walker—"not a doubt."

It is evident that the characteristics of the "factory age" to which reference is made above would have acted upon native British as upon any other stock; and that it has universally so acted there is abundant statistical evidence, in Europe and even in a land of such youth and ample opportunities as Australia. The assumption explicitly made by General Walker that among the immigrants no influence was yet excited in restriction of population, is also not only gratuitous, but inherently weak; the European peasant who landed (where the great majority have stayed) in the eastern industrial states was thrown suddenly under the influence of the forces just referred to; forces possibly of stronger influence upon him than upon native classes, which are in general economically and socially more stable. On the whole, the better opinion is probably that of a later authority on the vital statistics of the country, Dr John Shaw Billings,[3] that though the characteristics of modern life doubtless influence the birth-rate somewhat, by raising the average age of marriage, lessening unions, and increasing divorce and prostitution, their great influence is through the transmutation into necessities of the luxuries of simpler times; not automatically, but in the direction of an increased resort to means for the prevention of child-bearing.

Education.—In the article EDUCATION (*United States*), and in the articles on the several states, details are given generally of the conditions of American education. Here the statistics of literacy need only be considered.

In 1900 illiterates (that is, persons unable to write, the majority of these being also unable to read) constituted nearly one-ninth (10·7%) of the population of at least ten years of age; but the greatest part of this illiteracy is due to the negroes and the foreign immigrants. Since 1880 the proportion of illiteracy has steadily declined for all classes, save the foreign-born between 1880 and 1890, owing to the beginning in these years, on a large scale, of immigration from southern Europe. Illiteracy is less among young persons of all classes than in the older age-groups, in which the foreign-born largely fall. This is due to the extension of primary education during the last half of the 19th century. The older negroes (who were slaves) naturally, when compared with the younger, afford the most striking illustration of this truth. On the other hand, a notable exception is afforded by the native whites of native parents, particularly in the South, where child illiteracy (and child labour) is highest; the declining proportion of illiterates shown by the age-groups of this class up to 24 years is apparently due to a will to learn late in life.

The classification of the illiterate population (above 10 years of age) by races shows that the Indians (56·2%), negroes (44·5%), Chinese (29·0%), Japanese (18·3%), foreign white (13·0%), native white of native parentage (5·7%), and native whites of foreign parents (1·6%), are progressively more literate. The advantage of the last as compared with native whites of native parentage is apparently owing to the lesser concentration of these in cities. The percentages of illiterate children for different classes in 1900 were as follows: negroes, 30·1; foreign whites, 5·6; native whites of foreign parentage, 0·9; native whites of native parentage, 4·4. There is a greater difference in the North than in the South between the child illiteracy of the Caucasian and non-Caucasian elements; also a ranking of the different sections of the country according to the child illiteracy of one and the other race shows that the negroes of the South stand relatively as high as do its whites. All differences are lessened if the comparison be limited to children, and still further lessened if also limited to cities. Thus, the illiteracy of non-Caucasians was 44·5%, of their children 30·1%, and of such in cities of 25,000 inhabitants, 7·7%.

In the total population of 10 years of age and over the female sex is more illiterate than the male, but within the age-group 10 to 24 years the reverse is true. In 1890 females preponderated among illiterates only in the age-group 10 to 19 years. The excess of female illiteracy in the total population also decreased within the same period, from 20·3 to 10·8 illiterates in a thousand. The tendency is therefore clearly toward an ultimate higher literacy for females; a natural result where the two sexes enjoy equal facilities of schooling, and the females greater leisure. Among the whites attending school there was still in 1900 a slight excess of males; among the negro pupils females were very decidedly in excess. In all races there has been since 1890, throughout the country, a large increase in the proportion of girls among the pupils of each age-group; and this is particularly true of the group of 15 years and upward—that is of the grammar school and high school age, in which girls were in 1900 decidedly preponderant. A similar tendency is marked in college education.

Religious Bodies.—According to the national census of religious bodies taken in 1906 there were then in the country 186 denominations represented by 212,230 organizations, 92·2% of which represented 164 bodies which in history and general character are identified more or less closely with the Protestant Reformation or its subsequent development. The Roman Catholic Church contributed 5·9% of the organizations. Among other denominations the Jewish congregations and the Latter Day Saints were the largest. The immigrant movement brings with it many new sects, as, for example, the Eastern Orthodox churches (Russian, Servian, Syrian and Greek), which had practically no existence in 1890, the year of the last preceding census of religious bodies. But the growth of independent churches is most remarkable, having been sixfold since 1890.

The statistics of communicants or members are defective, and because of the different organization in this respect of different bodies, notably of the Protestants and Roman Catholics, comparisons are more or less misleading. Disregarding, however, such incomparability, but excluding 15% of all Roman Catholics (for children under 9 years of age), the total number of church members was 32,936,445, of whom 61·6% were Protestants, 36·7% Roman Catholics and 1·7% members of other churches. The corresponding figures in 1890 were 68·0, 30·3 and 1·7%. For the reasons just given these figures do not accurately indicate the religious affiliations of the population of the United States. In this particular they very largely understate the number of Hebrews, whose

[1] Table from Rossiter, *op. cit.*, p. 103.

[2] See his *Discussions in Economics and Statistics*, ii. 422, "Immigration and Degradation."

[3] See the *Forum* (June, 1893), xv. 467.

communicants (0·3%) are heads of families only, and largely of the Protestants; whereas they represent practically the total Roman Catholic population above 9 years of age. In comparing the figures of 1890 with those of 1906 these cautions are not of force, since both census counts were taken by the same methods. The membership of the Protestant bodies increased in the interval 44·8%, while that of the Roman Catholic Church increased 93·5%. The immigration from Catholic countries could easily account for (though this does not prove that in fact it is the only cause of) this great increase of the Roman Catholic body.

Among the Protestants, the Methodists with 17·5% of the total membership, the Baptists with 17·2, the Lutherans with 6·4, the Presbyterians with 5·6 and the Disciples and Christians with 3·5—each of these bodies comprising more than a million members—together include one-half of the total church membership of the country, and four-fifths (81·3%) of all Protestant members.

The Baptists and Methodists are much stronger in the South, relatively to other bodies, than elsewhere; the former constituting in the South Atlantic states 43·9% of all church members, and in the South Central states 39·5%. Adding in the Methodists these proportions become 76·3 and 65·3%. The Lutherans are relatively strongest in the North Central division of the country (13·2%); the Presbyterians in the North Atlantic and Western divisions (6·0%); and the Disciples in the South Central division (6·1%). The Roman Catholics are strongest in the Western division and the North Atlantic division, with 49·2% in the former and 56·6% in the latter of all church members; their share in the North Central division is 36·9%. Thus the numerical superiority of the Baptists and Methodists in the two Southern divisions is complementary to that of the Roman Catholics in the other three divisions of the country. New York, Rhode Island, Massachusetts and New Hampshire in the eastern part of the country, Louisiana in the south, and New Mexico, Arizona, California and Montana in the western part are distinctively Roman Catholic states, with not less than 63% of these in the total church body. Racial elements are for the most part the explanation. So also the immigration of French Canadians and of Irish explains the fact that in every state of one-time Puritan New England the Roman Catholics were a majority over Protestants and all other churches. This was true in 1890 of 12 states, while in one other the Roman Catholics held a plurality; in 1906 the corresponding figures were 16 and 20. The Protestant bodies are more widely and evenly distributed throughout the country than are the Roman Catholics.

The total value of church property (almost in its entirety exempt from taxation) reported in 1906 was $1,257,575,867, of which $935,942,578 was reported for Protestant bodies, $292,638,786 for Roman Catholic bodies, and $28,994,502 for all other bodies.

Occupations.—29,073,233 persons 10 years or more of age—nearly two-fifths (38·3%) of the country's total population—were engaged in gainful occupations in 1900. Occupations were reported first for free males in 1850, and since 1860 women workers have been separately reported. Five main occupation groups are covered by the census: (1) agriculture, (2) professional service, (3) domestic and personal service, (4) trade and transportation, (5) manufacture and mechanical pursuits. The percentage of all wage-earners engaged in these groups in 1900 was 35·7, 4·3, 19·2, 16·4, and 24·4 respectively. Outside of these are the groups of mining and fishing.

Although manufactures have increased tremendously of recent years—their products representing in 1905 a gross total of $14,802,147,087 as compared with $6,309,000,000 for those of farms (according to the U.S. Department of Agriculture)—agriculture is still the predominant industry of the United States, employing nearly half of the workers, and probably giving subsistence to considerably more than half of the people of the country.

Turning to the factor of sex, it may be stated that the total number of the gainfully employed in 1900 above given included 80·0% of all the men and boys, and 18·8% of all the women and girls in the country. The corresponding figures in 1880 were 78·7 and 14·7%. The proportion of women workers is greatest in the North Atlantic group of states (22·1%) where they are engaged in manufacturing, and in the South (23·8) where negro women are engaged in agricultural operations. The percentage of such wage-earners is therefore increasing much more rapidly in the former region. But in all other parts of the country the increase is faster than in the South; since aside from agriculture, which has long been in a relatively stable condition, there is not by any means so strong a movement of women into professional services in city districts. The increase is universal. There is not a state that does not show it. The greatest increase for any section between 1880 and 1900 was that of the North Central division from 8·8 to 14·3%. Here too both factors—farm-life, as in North Dakota, and manufacturing, as in Illinois—showed their plain influence.

Of all agricultural labourers 9·4% were females in 1900 (7·7 in 1880); but in the South the proportion was much greater—16·5 in the South Atlantic and 14·9 in the South Central division. In professional service 34·2% (in 1880, 29·4) were females, the two northern sections showing the highest proportions. In the occupations of musicians and teachers of music, and of school-teachers and professors (which together account for seven-eighths of professional women) women preponderate. The same sex constituted only 37·5% (34·6% in 1880) of the wage-earners of the third group; the South also showing here, as is natural in view of its coloured class, much the highest and the Western division of states much the lowest percentage. Women are in excess in the occupations of boarding and lodging house keepers, housekeepers, launderers, nurses and midwives, and servants and waiters. These account for almost all women in this group; servants and waitresses make up two-thirds of the total. Finally, in the fourth and fifth groups the percentage of women was 10·6 (3·4 in 1880) and 18·5 (16·7 in 1880). In manufactures the South Atlantic states show a higher percentage than the North Central, owing to the element of child-labour already indicated. In the third group women greatly preponderate in the occupation of stenographers and type-writers; and in those of book-keepers and accountants, clerks and copyists, packers and shippers, saleswomen (which is the largest class), and telegraph and telephone operators they have a large representation (13 to 34%). A great variation exists in the proportion of the sexes employed in different manufacturing industries. Of dress-makers, milliners, seamstresses (which together make up near half of the total in this occupation group) more than 96% are women. Of the makers of paper boxes, of shirts, collars and cuffs, of hosiery and knitting mill operatives, of glove-makers, silk mill operatives and book-binders they are more than half; so also of other textile workers, excluding wool and cotton mill operatives (these last the second largest group of women workers in manufactures), in which occupations males are in a slight excess. The distribution of women wage-earners in 1900 among the great occupation groups was as follows: in agriculture, 18·4%; professional service, 8·1%; domestic and personal service, 39·4%; trade and transportation, 9·4%; manufacturing and mechanical pursuits, 24·7%.

The proportion which children 10 to 15 years of age engaged in gainful occupations bore to the whole number of such children was in 1880 24·4% for males, and 9·0% for females. Twenty years later the corresponding figures were 26·1 and 10·2%. In the North Atlantic and North Central states, notwithstanding their manufacturing industries, the proportions were much lower (17·1 and 17·0 in 1900), and they increased very little in the period mentioned. In the Western group the increase was even less, and the total (10·9% in 1900) also. But in the South Atlantic and the South Central states—where agriculture, mining and manufacturing have in recent decades become important—although the increase was very slight, the proportions were far above those of the other sections, both in 1880 and in 1900. In the former year the ratios were 40·2 and 41·5, in the latter 41·6 and 42·7%. In Alabama (70·8% in 1880), North and South Carolina, and Arkansas the ratio exceeded 50% in 1900.

National Wealth.—Mulhall has estimated the aggregate wealth of the United States in 1790 at $620,000,000, assigning of this value $479,000,000 to lands and $141,000,000 to buildings and improvements. It is probable that this estimate is generous according to the values of that time. But even supposing $1,000,000,000 to be a juster estimate according to present-day values, it is probable that the increase of this since 1790 has been more than a hundredfold and since 1850 (since when such data have been gathered by the census) about fifteenfold. The value of farm property increased from $3,967,343,580 in 1850 to $20,439,901,164 in 1900. The gross value of manufactures rose in the same interval from $1,019,106,616 to $13,010,036,514; of farm products, from $2,212,540,927 in 1880 to $6,309,000,000 in 1900. The census estimate of the true value of "property" constituting the national wealth was limited in an enumeration of 1850 to taxable realty and privately held personalty; in 1900 it covered also exempt realty, government land, and corporation and public personalty. The estimate of the national wealth of 1850 was $7,135,780,228; in 1904 (made by the census office), $107,104,192,410. It may be added that the net ordinary revenue of the government was in 1850 $43,592,889, and in 1909 $662,324,445; that the value of imports rose from $7·48 *per capita* in 1850 to $14·47 in 1909; and of exports from $6·23 to $18·50. The public debt on the 1st of November 1909, less certificates and notes offset by cash in the Treasury, was $1,295,147,432.04.

(F. S. P.)

VI.—Industries and Commerce

Manufactures.—In the colonial period there were beginnings in some lines of manufacturing, but the policy of the British government was generally hostile and the increase was insignificant. In the first decades after the establishment of independence the resources and energies of the nation were absorbed in the task of occupying the vacant spaces of a continent, and subduing it to agriculture; and so long as land was so abundant that the spreading population easily sustained itself upon the fruits of the soil, and satisfied the tastes of a simple society with the products of neighbourhood handicrafts, there was no incentive to any real development of a factory economy. This has been, for the most part, a development since the Civil War.

No attempt was made in the census enumerations of 1790 and 1800 to obtain statistics of manufactures. In 1810 Congress provided for such a report, but the results were so imperfect that there was never published any summary for the country, nor for any state. Nor were the data secured in 1820 and 1840 of much value. Since 1850, however, provision has been made on an ample scale for their collection, although the constant modifications of the schedules under which the statistics were arranged makes very difficult comparisons of the latest with the earlier censuses.

From 1850 to 1900 fairly full industrial statistics were gathered as a part of each decennial census. In 1905 was taken the first of a new series of special decennial censuses of manufactures, in which only true factories—that is, establishments producing standardized products intended for the general market—were included, and mere "neighbourhood" (local) establishments of the hand trades were excluded. Without corrections, therefore, the figures of earlier censuses are not comparable with those of the census of 1905. Thus of 512,254 establishments included in the reports of 1900, six-tenths, employing 11·2% of the total number of wage-earners and producing 12·3% of the total value of all manufactures, must be omitted as "neighbourhood" establishments in order to make the following comparison of the results of the two enumerations of 1900 and 1905. The magnitude in 1905 of each of the leading items, and its increase since 1900, then appear as follows: number of factories, 216,262, increase 4·2%; capital invested, $12,686,265,673, increase 41·3%; salaries, $574,761,231, increase 50·9%; total wages, $2,009,735,799, increase 29·9%; miscellaneous expenses, $1,455,019,473, increase 60·7%; cost of materials, $8,503,949,756, increase 29·3%; value of products, including custom work and repairing (in such factories), $14,802,147,087, being an increase of 29·7%. Of the last item $3,269,757,067 represented the value of the products of rural factories (that is, those in cities of under 8000 inhabitants). The increase of the different items during the five years was greater in every case in the rural than in the urban factories. There was a very slight decline in the number of child labourers both in city and country, their total number in 1905 being 159,899 and in 1900 161,276. The total wages paid to children under 16 years, however, which was in 1905 $27,988,207, increased both in the city and, especially, in the country, and was 13·9% greater in 1905 than five years earlier. In the same period there was an increase of 16·0% in the number and of 27·5% in the wages of women workers of 16 years (and upwards) of age.

Deducting from the total value of manufactured products in 1905 the cost of partially manufactured materials, including mill supplies, a net or true value of $9,821,205,387 remains. Partially manufactured articles imported for use in manufactures are not included. Deducting from this the cost of raw materials and adding the cost of mill supplies, the result—$6,743,399,718—is the value added to materials by manufacturing processes.

The extent to which manufactures are controlled by large factories is shown by the fact that although in 1905 only 11·2% of the total number reported products valued at $100,000 or over, these establishments controlled 81·5% of the capital, employed 71·6% of the wage earners, and produced 79·3% of the value of the products, of all establishments reported. 52·3% of the total number, employing 66·3% of all wage-earners, and producing 69·7% of the total product-value, were in urban centres.

Only six establishments in a thousand employed as many as 500 workers, and only two in a thousand employed as many as 1000 workers. Cotton mills are most numerous in the last class of establishments. The manufacture of lumber and timber gave employment to the largest total number of workers; and this industry, together with those of foundry and machine shops (including locomotives, stoves and furnaces), cotton goods (including small wares), railway car and repair shops, and iron and steel, were (in order) the five greatest employers of labour.

Measured by the gross value of products, wholesale slaughtering and meat packing was the most important industry in 1905. The products were valued at $801,757,137. In each of four other industries the products exceeded in value five hundred millions of dollars, namely, those of foundry and machine shops, flour and grist mills, iron and steel, and lumber and timber. In one other, cotton goods, the value was little less. These six industries contributed 27·2% of the value of all manufactured products. Both in 1905 and in 1900 the group of industries classed as of food and kindred products ranked first in the cost of materials used and the value of products; the group of iron and steel ranking first in capital and in wages paid; and textiles in the number of wage-earners employed.

The close relation of manufactures to agriculture is reflected in the fact that, of the raw materials used, 79·4% came from the farm. The remainder came from mines and quarries, 15·0%; forests, 5·2%; the sea, 0·4%.

Four states—New York, Pennsylvania, Illinois and Massachusetts—each manufactured in 1900 products valued at over $1,000,000,000; New York exceeding and Pennsylvania attaining almost twice that sum. The manufacture of some products is highly localized. Thus, of silk goods, worsteds, the products of blast furnaces, of rolling mills and steel works, glass, boots and shoes, hosiery and knit goods, slaughtering and meat products, agricultural implements, woollens, leather goods, cotton goods and paper and wood pulp, four leading states produced in each case from 88·5%, in the case of silk goods, to 58·6% in the case of pulp.

M. G. Mulhall (*Industry and Wealth of Nations*, 1896) assigned fourth place to the United States in 1880 and first place in 1894 in the value of manufactured products, as compared with other countries. Paul Leroy-Beaulieu (*Les États-Unis au xx^{me} Siècle*, Paris, 1904) would assign primacy to the United States as far back as 1885. Since the English board of trade estimated the exports of British manufactured goods at from 17 to 20% of the industrial output of the United Kingdom in 1902, this would indicate a manufactured product hardly two-thirds as great as that of the true factory establishments of the United States in 1900. But exact data for comparison do not exist for other countries than the United States. In the production of pig iron, the share of the United States seems to have been in 1850 about one-eighth and that of Great Britain one-half of the world's product; while in 1903 the respective shares were 38·8 and 19·3%; and Germany's also slightly exceeded the British output. In the manufacture of textiles the United States holds the second place, after Great Britain; decidedly second in cottons, a close competitor with Great Britain and France in woollens, and with France in silks. In the manufacture of food products the United States holds a lead that is the natural result of immense advantages in the production of raw materials. No other country produces half so much of leather. In the dependent industry of boots and shoes her position is commanding. These facts give an idea of the rank of the country among the manufacturing countries of the world. The basis of this position is generally considered to be, partly, immense natural resources available as materials, and, partly, an immense home market.

For *Agriculture*, see the article AGRICULTURE; for *Fisheries*, see FISHERIES; and for *Forestry*, see FORESTS AND FORESTRY.

Minerals.—In 1619 the erection of "works" for smelting the ores of iron was begun at Falling Creek, near Jamestown, Va., and iron appears to have been made in 1620; but the enterprise was stopped by a general massacre of the settlers in that region. In 1643 the business of smelting and manufacturing iron was begun at Lynn, Mass., where it was successfully carried on, at least up to 1671, furnishing most of the iron used in the colony. From the middle of the 17th century the smelting of this metal began to be of importance in Massachusetts Bay and vicinity, and by the close of the century there had been a large number of ironworks established in that colony, which, for a century after its settlement, was the chief seat of the iron manufacture in America, bog ores, taken from the bottom of the ponds, being chiefly used. Early in the 18th century the industry began to extend over New England and into New Jersey, the German bloomery forge being employed for reducing the ore directly to bar iron, and by the middle of that century it had taken a pretty firm hold in the Atlantic colonies. About 1789 there were fourteen furnaces and thirty-four forges in operation in Pennsylvania. Before the separation of the colonies from the mother country, the manufacture of iron had been extended through all of them, with the possible exception of Georgia. As early as 1718 iron (both pig and bar) began to be sent to Great Britain, the only country to which the export was permitted, the annual amount between 1730 and 1775 varying ordinarily between 2000 and 3000 tons, but in one year (1771) rising to between 7000 and 8000 tons.

The first metal other than iron mined by whites within the territory of the United States was lead, the discovery of which on the American continent was recorded in 1621. The first English settlers on the Atlantic bartered lead of domestic origin with the Indians in the 17th century, and so did the French in the upper Mississippi Valley. The ore of the metal occurring in the Mississippi basin—galena—is scattered widely and in large quantities, and being easily smelted by the roughest possible methods was much used at an early date. In the second half of the 18th century, during the period of French and Spanish domination in the valley, lead was a common medium of exchange, but no real mining development took place. Copper was the next metal to be mined, so far as is known. The first company began work about 1709, at Simsbury, Conn. The ore obtained there and in New Jersey seems to have been mostly shipped to England. A few years later attempts were made to work mines of lead and cobalt in Connecticut and Massachusetts.

The first mining excitement of the United States dates back to the discovery of gold by the whites in the Southern states, along the eastern border of the Appalachian range, in Virginia, and in North and South Carolina. The existence of gold in that region had been long known to the aboriginal inhabitants, but no attention was paid to this by the whites, until about the beginning of the 19th century, when nuggets were found, one of which weighed 28 lb.

From 1824 the search for gold continued, and by 1829 the business had become important, and was attended with no little excitement. In 1833 and 1834 the amount annually obtained had risen to fully a million of dollars. A rapid development of the lead mines of the West, both in Missouri and on the Upper Mississippi in the region where Iowa, Wisconsin and Illinois adjoin one another, took place during the first quarter of the 19th century, and as early as 1826 or 1827 the amount of this metal obtained had risen to nearly 10,000 tons a year. By this time the making of iron had also become important, the production for 1828 being estimated at 130,000 tons.

In 1820 the first cargo of anthracite coal was shipped to Philadelphia. From 1830 the increase in the production was very rapid, and in 1841 the annual shipments from the Pennsylvania anthracite region had nearly reached 1,000,000 tons, the output of iron at that time being estimated at about 300,000 tons. The development of the coal and iron interests, and the increasing importance of the gold product of the Appalachian auriferous belt, and also of the lead product of the Mississippi Valley, led to a more general and decided interest in geology and mining; and about 1830 geological surveys of several of the Atlantic states were begun, and more systematic explorations for the ores of the metals, as well as for coal, were carried on over all parts of the country then open to settlement. An important step was taken in 1844, when a cession of the region on the south shore of Lake Superior was obtained from the Chippewa Indians. Here explorations for copper immediately began, and for the first time in the United States the business of mining for the metals began to be developed on an extensive scale, with suitable appliances, and with financial success. An event of still greater importance took place almost immediately after the value of the copper region in question had been fully ascertained. This was the demonstration of the fact that gold existed in large quantities along the western slope of the Sierra Nevada of California. In five years from the discovery of gold at Coloma on the American river, the yield from the auriferous belt of the Sierra Nevada had risen to an amount estimated at between sixty-five and seventy millions of dollars a year, or five times as much as the total production of this metal throughout the world at the beginning of the century.

The following details show the development of the mineral resources of the country at the middle of the 19th century. In 1850 the shipments of anthracite amounted to nearly 3,500,000 tons; those of Cumberland or semi-bituminous coal were about 200,000 tons. The yearly production of pig iron had risen to between 500,000 and 600,000 tons. The annual yield of gold in the Appalachian belt had fallen off to about $500,000 in value, that of California had risen to $36,000,000, and was rapidly approaching the epoch of its culmination (1851–1853). No silver was obtained in the country, except what was separated from the native gold, that mined in California containing usually from 8 to 10 % of the less valuable metal. The ore of mercury had been discovered in California before the epoch of the gold excitement, and was being extensively worked, the yield in the year 1850–1851 being nearly 2,000,000 lb. At this time the copper mines of Lake Superior were being successfully developed, and nearly 600 tons of metallic copper were produced in 1850. At many points in the Appalachian belt attempts had been made to work mines of copper and lead, but with no considerable success. About the middle of the century extensive works were erected at Newark, New Jersey, for the manufacture of the oxide of zinc for paint; about 1100 tons were produced in 1852. The extent and value of the deposits of zinc ore in the Saucon Valley, Pennsylvania, had also just become known in 1850. The lead production of the Missouri mines had for some years been nearly stationary, or had declined slightly from its former importance; while that of the upper Mississippi region, which in the years just previous to 1850 had risen to from 20,000 to 25,000 tons a year, was declining, having in 1850 sunk to less than 18,000 tons.

Mining Industries about 1850.

At the end of the century, in only fifty years, the United States had secured an easy first place among the mineral-producing countries of the world. It held primacy, with a large margin, in the yield of coal, iron, lead and copper, the minerals most important in manufactures; in gold its output was second only to that of South Africa (though practically equalled by that of Australia); and in silver to that of Mexico. Although the data are in general incomplete upon which might be based a comparison of the relative standing of different countries in the production of minerals of lesser importance than those just mentioned, it was estimated by M. G. Mulhall (*Industries and Wealth of Nations*, edition of 1896, pp. 34–35) that Great Britain then produced approximately one-third, the United States one-third, and all other countries collectively one-third of the minerals of the world in weight.

Present Position of Mining Industries.

The leading products, as reported by the Geological Survey for 1907, were as follows: coal, $614,798,898 (85,604,312 tons of anthracite coal, 394,759,112 of bituminous); petroleum, $120,106,749; natural gas, $54,222,399; iron ore, $131,996,147 (pig iron, $529,958,000); copper, refined, $173,799,300; gold, coinage value, $90,435,700; building-stone, $71,105,805; silver, commercial value, $37,299,700; lead, refined, $38,707,596; and zinc, refined, $26,401,910. The North Atlantic and the North Central census groups of states (that is, the territory east of the Mississippi and north of the Ohio rivers, and north of Maryland) produced two-thirds of the total output. Pennsylvania, Ohio, Illinois, West Virginia, California, Colorado, Montana, Michigan, New York and Missouri were the ten states of greatest absolute production in 1907. The rank relative to area or population is of course different. Those which, according to the bureau of the census, produced $1000 or over per sq. m. in 1902 were Pennsylvania, Ohio and West Virginia; $500 to $1000, Illinois, Michigan, Indiana, Vermont and Massachusetts. Seventeen states produced from $100 to $500 per sq. m.

The total mineral output for the decade 1899–1908 according to the United States Geological Survey was as follows:—

Year.	Total Value of Products.	Value of Non-metallic Products.	Value of Metallic Products.
	$	$	$
1908	1,595,670,186	1,045,497,070	549,923,116
1907	2,071,607,964	1,167,705,720	903,802,244
1906	1,902,517,565	1,016,206,709	886,110,856
1905	1,623,928,720	921,075,619	702,453,101
1904	1,361,067,554	859,383,604	501,099,950
1903	1,491,928,980	793,962,609	624,318,008
1902	1,323,102,717	617,251,154	642,258,584
1901	1,141,972,309	567,318,592	518,266,259
1900	1,107,020,352	512,195,262	550,425,286
1899	1,014,355,705	446,090,251	525,472,981

The vastly greater part of mineral products are used in manufactures within the United States, and only an insignificant part (for example, 2·47 % in 1902) is exported in the crude form.

Coal.

Coal exists in the United States in large quantity in each of its important varieties: anthracite, or hard coal; bituminous, or soft coal; and lignite; and in various intermediate and special grades. Geologically the anthracite and bituminous coals mainly belong to the same formation, the Carboniferous, and this is especially true of the better qualities; though it is stated by the United States Geological Survey that the geologic age of the coal beds ranges from Carboniferous in the Appalachian and Mississippi Valley provinces to Miocene (Tertiary) on the Pacific coast, and that the quality of the coal varies only to a very uncertain degree with the geologic age. The following estimates rest upon the same authority: (1) total area underlaid by coal measures, 496,776 sq. m., of which 250,531 are credited to anthracite and bituminous, 97,636 to sub-bituminous and 148,609 to lignite; (2) total original coal supply of the country, 3,076,204,000,000 short tons, including 21,000,000,000 tons of anthracite in Pennsylvania, and small amounts elsewhere (semi-anthracite and semi-bituminous), 650,157,000,000 tons of sub-bituminous and 743,590,000,000 tons of lignite; (3) easily accessible coal still available, 1,992,979,000,000 tons; (4) available coal accessible with difficulty, 1,153,225,000,000 tons.

The total production of coal from 1814 (the year in which anthracite was first mined in Pennsylvania) to 1908 amounted to 7,280,940,265 tons, which represented an exhaustion—adding 50 % for waste in mining and preparation—of 11,870,049,900, or four-tenths of 1 % of the supposed original supply.

In 1820 the total production was only 3450 tons In 1850 it was already more than 7,000,000. And since then, while the population increased 230 % from 1850 to 1900, the production of coal increased 4,084 %. At the same time that the per capita consumption thus rose in 1907 to 5·6 tons, the waste was estimated by the National Conservation Commission at 3·0 tons per capita. This waste, however, is decreasing, the coal abandoned in the mine having averaged, in the beginning of mining, two or three times the amount taken out; and the chief part of the remaining waste is in imperfect combustion in furnaces and fire-boxes. Thus, notwithstanding the fact that the supposed supply still available at the close of 1908 was 7369 times the production of that year, and 4913 times the exhaustion such production represented, so extraordinary has been the increased consumption of the country that, in the opinion of the Geological Survey (1907), "if the rate of increase that has held for the last fifty years is maintained, the supply of easily available coal will be exhausted before the middle of the next century" (A.D. 2050).

In 1870 both Great Britain and Germany exceeded the United States in the production of coal. Germany was passed in 1871 (definitively in 1877); Great Britain in 1899. Since 1901 the United States has produced more than one-third of the world's output.

Coal was produced in 1908 in 30 states out of the 46 of the Union; and occurs also in enormous quantities in Alaska; 690,438 men were employed in this year in the coal mines. Pennsylvania (117,179,527 tons of bituminous and 83,268,754 of anthracite), Illinois (47,659,690), West Virginia (41,897,843), Ohio (26,270,639), Indiana (12,314,890) and Alabama (11,604,593) were the states of greatest production. The production of each was greater still in 1907.

The total output amounted to 415,842,692 short tons, valued at

$532,314,117 in 1908; and to 480,363,424 tons, valued at $614,798,898 in 1909. Pennsylvania produced three-fourths of the total output of the country in 1860, and since 1900 slightly less than one-half. Up to 1870 there was more anthracite mined in Pennsylvania than bituminous in the whole country, but since that year the production of the latter has become vastly the greater, the totals in 1907, in which year each stood at its maximum, being 83,268,754 and 332,573,944 tons respectively.

Inasmuch as the present production is not considered locally—and with more or less justice—as at all indicative of the wealth in coal of the respective states, it may be said that according to estimates of the Geological Survey the following states are credited with the deposits indicated of true bituminous coal, including local admixtures of anthracite, the figures being millions of short tons: Colorado, 296,272; Illinois, 240,000; West Virginia, 231,000; Utah, 196,408; Pennsylvania, 112,574; Kentucky, 104,028; Ohio, 86,028; Alabama, 68,903; Indiana, 44,169; Missouri, 40,000; New Mexico, 30,805; Tennessee, 25,665; Virginia, 21,600; Michigan, 12,000; Maryland, 8,044; Texas, 8,000; Kansas, 7,022; and Montana, 5,000; with lesser deposits in other states. At the same time there are estimated deposits of sub-bituminous coal, isolated or mixed with bituminous, amounting to 75,498 millions of tons in Colorado (which is probably the richest coal area of the country); and in other states as follows: Wyoming, 423,952 millions of tons; New Mexico, 132,975; Washington, 20,000; Montana, 18,560; California and Oregon, 1,000 each; and lesser amounts elsewhere. Finally, of true lignite beds, or of lignite mixed with sub-bituminous qualities, the states of North Dakota, Montana, Texas and South Dakota are credited with deposits of 500,000; 279,500; 23,000; and 10,000 millions of tons respectively. But it is to be remembered that the amount and the fuel value of both the lignite and, to a lesser degree, the sub-bituminous coals, is uncertain to a high degree.

Petroleum. Petroleum, according to the report of the National Conservation Commission in 1908, was then the sixth largest contributor to the nation's mineral wealth, furnishing about one-sixteenth of the total. Oil was produced in 1908 in sixteen states. This productive area is divided by the United States Geological Survey into six "fields" (in addition to some scattering states) with reference to the quality of oil that they produce, such quality determining their uses. The Appalachian field (Pennsylvania, New York, Ohio, West Virginia and Tennessee) produces oil rich in paraffin, practically free from sulphur and asphalt, and yielding the largest percentage of gasoline and illuminating oils. This is the highest grade crude oil produced in the world. The California field produces oil characterized by much asphalt and little or no paraffin, and low in volatile constituents. The Lima (Ohio)-Indiana, the Illinois, the Mid-Continent (Kansas, Oklahoma and northern Texas) and the Gulf (Texas and Louisiana) fields produce oils containing more or less of sulphur and asphalt between the extremes of the two other fields just mentioned. The geological conditions of the different fields, and the details of the composition of the oils yielded, are exceedingly varied, and their study has been little more than begun.

In 1859, when the total output of the country is supposed to have been only 2000 barrels of oil, production was confined to Pennsylvania and New York. Ohio, West Virginia and California appeared as producers in 1876, Kentucky and Tennessee in 1883, Colorado in 1887, Indiana in 1889, along with Illinois, Kansas, Texas and Missouri, Oklahoma in 1891, Wyoming in 1894, and, lastly, Louisiana in 1902. From 1859 to 1876 the Appalachian field yielded 100% of the total output of the country; in 1908 its share had fallen to 13·9%. In the same period of 50 years the yearly output rose from 2000 to 179,572,479 barrels (134,717,580 in 1905) and to a grand total of 1,986,180,942 barrels,[1] worth $1,784,583,943, or more than half the value of all the gold, and more than the commercial value of all the silver produced in the country since 1792. The production in 1908 exceeded in value the output of both metals. Deducing from the figures of production since 1859 an equation of increase, one finds that in each nine years as much oil has been produced as in all preceding years together, and in recent years the factor of increase has been higher. So rapid has been the extension of the yielding areas, so diverse the fate of many fields, so shifting their relative rank in output, that the outlook from year to year as regards all these elements is too uncertain to admit of definite statements respecting the relative importance of the five fields already mentioned. The total output of these, it may be stated, from 1901 to 1908—uniting the yield of the Illinois to the Lima-Indiana field (since their statistics were long so united, until their industrial differences became apparent), and adding a sixth division for the production of scattered areas of production—was as follows: Appalachian, 235,999,859; Lima-Indiana-Illinois, 219,609,347; Mid-Continent, 136,148,892; Gulf, 159,520,306; California, 27,931,687; and others, 3,367,666; the leading producers in 1907-1908 being the Mid-Continent and the California areas.

The world's output of oil was trebled between 1885 and 1895, and quadrupled between 1885 and 1900. In this increase the United States had the largest share. So recently as 1902 the output of the United States was little greater than that of Russia (the two yielding 91·4% of the world's product), but this advantage has since then been greatly increased, so that the one has produced 63·1 and the other 21·8% of the total output of the world. In 1908 the Geological Survey issued a preliminary map of the then known areas productive of oil and natural gas in the United States, estimating the extent of the former at 8850 and of the latter at 9365 sq. m. The supply of oil in this area was estimated at from 15,000,000,000 to 20,000,000,000 barrels; and the National Conservation Commission of 1908 expressed the opinion that in view of the rapid increase of production and the enormous loss through misuse the supply cannot be expected to last beyond the middle of this century.

Natural Gas. Natural gas, as a source of light and for metallurgical purposes, became important in the mid-eighties. In recent years its use for industrial purposes has lessened, and for domestic purposes increased. The existence of outflows or springs of gas in the region west of the Alleghanies had long been known, and much gas was used for illuminating purposes in Fredonia, New York, as early as 1821. Such gas is a more or less general concomitant of oil all through the petroleum-bearing areas of the country. The total output of the country rose from a value of $215,000 in 1882 to one of $54,640,374 in 1908, with several fluctuations up and down in that interval. Pennsylvania, with a product valued at $155,620,395 from 1899 to 1908, West Virginia with $84,955,496, Ohio with $48,172,450 and Indiana with $46,141,553 were the greatest producers of the Union.

The National Conservation Commission in 1908 estimated the area of the known gas fields of the country at 9000 sq. m.; the portion of their yield in 1907 that was utilized at 400,000,000,000 cub. ft.; and the waste at an equal amount—more than 1,000,000,000 of cub. ft. daily, or enough to supply all the cities in the United States of above 100,000 population.

Of other non-metallic mineral substances, apart from coal, petroleum and natural gas, little need be said in detail. Stone is of the greatest actual importance, the value of the quarry output, including some prepared or manufactured product, such as dressed and crushed stone, averaging $65,152,312 annually in 1904–1908. Limestone is by far the largest element, and with granite makes up two-thirds of the total value. Vermont, Pennsylvania and New York are the leading producers. In this, as in other cases, actual product may indicate little regarding potential resources, and still less regarding the distribution of these throughout the Union. Glass and other sands and gravel ($13,270,032), lime ($11,091,186), phosphate rock ($10,653,558), salt ($7,553,632), natural mineral waters ($7,287,269), sulphur ($6,668,215, almost wholly from Louisiana), slate ($6,316,817), gypsum ($4,138,560), clay ($2,599,986), asphalt ($1,888,881), talc and soapstone ($1,401,222), borax ($975,000, all from California), and pyrite ($857,113) were the next most important products in 1908. It may be noted that the output in almost every item of mineral production was considerably greater in 1907 than in 1908, and the isolated figures of the latter year are of little interest apart from showing in a general way the relative commercial importance of the products named. In the yield of gypsum, phosphate rock and salt the United States leads the world. In sulphur it is a close second to Sicily. Phosphate rock is heavily exported, and in the opinion of the National Conservation Commission of 1908 the supply cannot long satisfy the increasing demand for export, which constitutes a waste of a precious natural resource. Other minerals whose production may be found stated in detail in the annual volume on *Mineral Resources* of the United States Geological Survey are: natural pigments, felspar, white mica, graphite, fluorspar, arsenic, quartz, barytes, bromine. Some dozens of varieties of precious stones occur widely. Of building-stone, clay, cement, lime, sand and salt, the country's supply was estimated by the National Conservation Commission of 1908 to be "ample."

Iron. In 1907 iron ore was mined for blast-furnace use in twenty-nine states only, but the ore occurs in almost every state of the Union. As nearly as can be estimated from imperfect statistics, the total ore production of the country rose steadily from 2,873,400 long tons in 1860 to 51,720,619 tons in 1907. The United States became practically independent of foreign ore imports during the decade 1870 to 1879. The iron-producing area of the country may be divided, with regard to natural geographic, historic and trade considerations, into four districts: (1) the Lake Superior district, embracing the states of Minnesota, Michigan and Wisconsin; (2) the southern district, embracing the triangle tipped by Texas, Maryland and Georgia; (3) the northern district, embracing the triangle tipped by Ohio, New Jersey and Massachusetts, plus the states of Iowa and Missouri; (4) the western district, which includes the states of the Rocky Mountain region and Pacific coast. Of these districts the Lake Superior region—which embraces the Marquette range (opened in 1854), the Menominee (1872), the Gogebic (1884), the Vermilion (1884) and the Mesabi (1892)—first attracted exploration about 1844, when the copper deposits of the same region were opened, and produced from 1854 to 1908 a total of 410,239,551 long tons, of which 341,036,883 were mined in the period 1889–1908. From the Mesabi range alone, opened in 1892, no less than 168,143,661 long tons were taken up to 1908. The

[1] Barrels of 42 gallons.

share of the whole district for some years past has been practically four-fifths of the total output of the country; and together with the yield of the southern district, more than 90%. Minnesota alone produces more than half of the same total, having multiplied her product since 1889 by more than 33 times. Michigan held first place in output until 1901. Alabama is the third great producer of the Union, and with the other two made up in 1907 more than four-fifths of the country's total. In 1907 the product of Minnesota (28,969,658 long tons) was greater than that of Germany (with Luxemburg), and nearly twice the production of Great Britain.

Of the two classes of iron minerals used as ores of that metal, namely, oxides and carbonates, the latter furnish to-day an insignificant proportion of the country's product, although such ores were the basis of a considerable part of the early iron industry, and even so late as 1889 represented one-thirteenth of the total. Of the oxides, various forms of the brown ores in locations near to the Atlantic coast were the chief basis of the early iron industries. Magnetites were also early employed, at first in Catalan forges, in which by means of a direct process the metal was secured from the ores and forged into blooms without being cast; later they were smelted in blast furnaces. But in the recent and great development of the iron industry the red haematite ores have been overwhelmingly predominant. From 1889 to 1907 the average yearly percentages of the red haematite, brown ores, magnetite and carbonate in the total ore production were respectively 82·4, 10·1, 7·1 and 0·4. In the census of 1870 the share of the three varieties appeared almost equal; in 1899 that of the red ores had risen to near two-thirds of the total. The red and brown ores are widely distributed, every state in the Union in 1907, save Ohio and North Carolina, producing one or both. Magnetite production was confined to mountain regions in the east and west, and only in Ohio were carbonates mined.

An investigation was made in 1908 for the National Conservation Commission of the ore reserves of the country. This report was made by Dr. C. W. Hayes of the Geological Survey. With the reservations that only in the case of certain red haematite bedded deposits can any estimate be made of relative accuracy, say within 10%; that the concentration deposits of brown ore can be estimated only with an accuracy represented by a factor varying between 0·7 and 3; and that the great Lake Superior and the less known Adirondack deposits can be estimated within 15 to 20%, the total supply of the country was estimated at 79,594,220,000 long tons—73,210,415,000 of which were credited to haematite ores and 5,054,675,000 to magnetite. Almost 95% is believed to lie about Lake Superior.

The output of pig iron and steel in 1907 was 25,781,361 and 23,362,594 long tons respectively. It is believed that the first steel made in the United States was made in Connecticut in 1728. Crucible steel was first successfully produced in 1832, Bessemer and open-hearth in 1864. Pennsylvania, Ohio, Illinois, Alabama and New York are the leading states in production.

Gold and Silver.

The washing of the high or Tertiary gravels by the hydraulic process and the working of mines in the solid rock did not, on the whole, compensate for the diminished yield of the ordinary placer and river diggings, so that the product of gold in California continued to fall off, and by 1860 had decreased to about half what it had been ten years before. Discoveries in other Cordilleran territories, notably in Montana and Idaho, made up, however, in part for the deficiency of California, so that in 1860 the total amount of gold produced in the United States was estimated at not less than $45,000,000. In the latter part of the decade 1850–1859 the territories adjacent to California on the east, north and south were overrun by thousands of miners from the Sierra Nevada goldfields, and within a few years an extraordinary number of discoveries were made, some of which proved to be of great importance. The most powerful impulse to mining operations, and the immediate cause of a somewhat lengthy period of wild excitement and speculation, was the discovery and successful opening of the Comstock lode in 1859, in the western part of what is now Nevada, but was then part of Utah. About this lode grew up Virginia City. From 1859 to 1902 the total yield of this lode was $204,653,040 in silver and $148,145,385 in gold; the average annual yield from 1862 to 1868 was above eleven millions; the maximum yield $36,301,537 in 1877; and the total product to July 1880 was variously estimated at from $304,752,171·54 to $306,181,251·25. The lode was an ore channel of great dimensions included within volcanic rocks of Tertiary age, themselves broken through pre-existing strata of Triassic age, and exhibited some of the features of a fissure vein, combined in part with those of a contact deposit and in part with those of a segregated vein. The gangue was quartz, very irregularly distributed in bodies often of great sizes, for the most part nearly or quite barren of ore. The metalliferous portion of the lode was similarly distributed in great masses, known as "bonanzas." The next most famous lode is that of Leadville, Colorado, which from 1879 to 1889 yielded $147,834,186, chiefly in silver and lead. In later years the Cripple Creek district of Colorado became specially prominent.

The total output of gold and silver in the United States according to the tables published by the Director of the Mint has been as follows:—

Years.	Gold. Quantity in Fine Ounces.	Gold. Value.	Silver. Quantity in Fine Ounces.	Silver. Commercial Value.
		$		$
1792-1847	1,187,170	24,537,000	309,500	404,500
1848-1872	58,279,778	1,204,750,000	118,568,200	157,749,900
1873-1908	88,833,231	1,836,344,000	1,664,271,300	1,379,892,200
	148,300,179	$3,065,631,000	1,783,149,000	$1,538,046,600

Colorado ($22,871,000), Alaska ($19,858,800), California ($19,329,700), Nevada ($11,689,400), South Dakota ($7,742,200), Utah ($3,946,700), Montana ($3,160,000) and Arizona ($2,500,000) were the leading producers in 1908, in which year the totals for the two metals were $94,560,000 for gold and $28,050,600 for silver.

The grade of precious ores handled has generally and greatly decreased in recent years—according to the census data of 1880 and 1902, disregarding all base metallic contents—from an average commerical value of $29·07 to one of $8·29; nevertheless the product of gold and silver has greatly increased. This is due to improvements in mining methods and reduction processes, which have made profitable low-grade ores that were not commercially available in 1880.

Copper.

Copper was produced in 1908 in twenty-four states of the Union. Their output was almost seventeenfold the quantity reported by the census of 1860. The quantity produced from 1845—the year in which the Lake Superior district became a producer, and in which the total product was only 224,000 ℔—up to 1908 was 13,106,205,634 ℔. The increases from 1845 to 1850, in each decennial period thereafter, and from 1901 to 1908, were as follows, in percentages: 50·0, 27·0, 6·1, 7·2, 14·8, 9·1 and 5·8. The total product passed 10,000,000 ℔ in 1857, 20,000,000 ℔ in 1867, 30,000,000 ℔ in 1873, 40,000,000 ℔ in 1875, 50,000,000 ℔ in 1879 and 100,000,000 ℔ in 1883. Comparing the product of the United States with that of the world, the figures for the two respectively were 23,350 and 151,936 long tons in 1879, when the United States was second to both Spain (and Portugal) and Chile as a producer; 51,570 and 199,406 long tons in 1883, when the Unites States first took leading rank; 172,300 and 334,565 long tons in 1895, when the yield of the United States first exceeded that of all other parts of the world combined; and 942,570,000 and 1,667,098,000 ℔ in 1908.

The three leading producing states or Territories of the Union are, and since the early 'eighties have been, Arizona, Montana and Michigan. With Utah and California their yield in 1908 was 93% of the total. During the decade ending with that year the average yearly output of the three first-named was 197,706,968 ℔, 267,172,951 ℔ and 192,187,488 ℔ respectively.

Lead.

The production of lead was for many years limited, as already mentioned, to two districts near the Mississippi: one the so-called Upper Mines of Wisconsin, Iowa and Illinois; the other the Lower Mines of south-eastern Missouri. The national government, after reserving the mineral lands (1807) and attempting to lease them, concluded in 1847 to sell them, owing to the difficulty of preventing illegal entry and collecting royalties. The yield of the Upper Mines culminated about 1845, and long ago became insignificant. The greatest lead district is in south-western Missouri and south-eastern Kansas, known as the Joplin-Galena district after the names of the two cities that are its centre. The United States is the greatest lead producer and consumer in the world, its percentage of the total output and consumption averaging 30·4% and 32·5% respectively in the years 1904–1908. Since 1825 the total product of lead refined from domestic ores and domestic base bullion was, up to the close of 1908, 7,091,548 short tons. An annual yield of 100,000 tons was first passed in 1881; of 200,000, in 1891; of 300,000, in 1898. The total refined domestic product in 1907 was 337,340, and the total domestic lead smelted was 365,166 tons. Of the smelter domestic product 235,559 tons were of desilverized lead and 129,607 of soft lead. Considerable quantities of foreign ores and base bullion are also refined in the United States. The average percentage of metallic recovery from lead ores was about 68%, in 1880, and again in 1902, according to the national censuses of these years. According to the bureau of the census the value in 1902 of the lead yielded by copper, by non-argentiferous lead and zinc, and by gold and silver ores respectively was $19,053, $5,850,721 and $12,311,239. This reflects the revolutionary change in the history of lead mining since the first discovery of argentiferous lead ores in the Rocky Mountain states in 1864, which became available only after the building of railways. Until the completion of the Union Pacific in 1869 there was no smelting of such ores except for their silver contents. The deposits in the Joplin-Galena district were discovered in 1848, but attracted little attention for three decades. Of the soft lead smelted in 1907 no less than 94·8% came from Missouri. Idaho, Utah and Colorado produce together almost as great a proportion of the desilverized lead, half of which has come in recent years from Idaho.

Spelter production began in the United States in 1858 in an experimental way, and regular production in 1860. The census of the latter year reported an output of product valued at $72,600. According to the census data for 1889 and 1902 there was an increase in value of product of 184·1 % in the interval, and of 109·5 % in the quantity of ore produced. The value of products in 1902 were reported as $340,686 from gold and silver ores, and $8,665,675 from non-argentiferous lead and zinc ores. The total product of zinc from domestic ore for the entire country was 7343 short tons in 1873, passed 100,000 tons in 1898, and 200,000 in 1907, when it amounted to 223,745 tons. From 1904 to 1908 the share of the United States in the world's output averaged 28·2 %, and in the world's consumption (disregarding stocks) 27·5 %. Of the product of 1907 above stated no less than 63·4 % came from Missouri alone; Colorado, Wisconsin, Kansas and New Jersey yielding together 30·8 % more.

Zinc.

Most of the quicksilver produced in the United States comes from California (86 % of the total in 1908), but a considerable quantity comes from Texas, and small amounts are produced in Utah, Arizona and Oregon. Veins of cinnabar are known elsewhere in the Rocky Mountain and Sierra Nevada regions but not in workable quantities. The mercurial ores of the Pacific Coast ranges occur in very irregular deposits in the form of strings and bunches, disseminated through a highly metamorphosed siliceous rock. The first locality where the metal was successfully mined was at New Almaden, about 100 m. south of San Francisco. These mines have been productive since 1824. Another old mine, discovered in 1853, is the New Idria located another 100 m. farther south. These two are still among the foremost producers.

Mercury.

From 1850 to 1908 California produced a total of 2,052,000 flasks of metal, of 76·5 lb (since June 1, 1904, 75·0 lb net) each. The year of greatest yield was 1877, with 79,395 flasks. The production had steadily fallen to 16,984 flasks in 1908, but in the opinion of the United States Geological Survey this reduction is mainly attributable, in recent years at least, to market conditions, and does not truly indicate the exhaustion of the mines, although the ores now available are of low grades, those of New Almaden having shown a decrease in yield from 36·7 % in 1850–1851 to 0·74 % in 1895–1896, so that only the greatest metallurgical skill and business economy can sustain the mines against a weak market.

Bauxite was produced on a commercial scale in four states in 1908: Alabama, Arkansas, Georgia and Tennessee; Arkansas producing—as for years past—more than six-tenths of the total product of the country. This rose from an insignificant amount in 1889 to 97,776 long tons (valued at $480,330) in 1907. The consumption of the United States is, however, much larger than its product, and is rapidly growing. The production of aluminium rose from 83 lb in 1883 to 7,500,000 lb in 1903, and a consumption (the Geological Survey not reporting the production) of 17,211,000 lb in 1907. Antimony, bismuth, selenium, tellurium, chromic iron ore, tin, nickel, cobalt, vanadium, titanium, molybdenum, uranium and tantalum are produced in the United States in small amounts, but such "production" in several cases has amounted to only slight discoveries, and in general they are of little importance in the market. Of tungsten the United States was in 1907 the greatest producer in the world (1640 tons in a total of 6062). Tin ores have been widely discovered, but though much has been hoped for from them, particularly from the deposits in the Black Hills region of South Dakota, there has been no more than a relatively insignificant commercial production.

Other Metals.

Commerce, Foreign and Domestic.—The English colonies that became the United States carried on during the colonial period a commerce with the mother country, and also, both so far as the legislative trammels of the British colonial system permitted it and illicitly, a fairly active commerce with the West Indies. This latter became of increasing moment in the successive periods of European colonial wars of the 18th century. With the achievement of independence by the United States the same interest became of still greater importance to the new nation, so as to constitute a leading element in its early diplomacy. Although relatively unsuccessful in securing access to the British islands, the importance of the United States as a supplier of the other West Indies continually grew, and when the communication of the French and Spanish islands with their metropolises was practically cut off by the British during the Napoleonic wars, the dependence of these colonies upon the American carrying trade became absolute. It was the profits of this neutral trade, notwithstanding the losses to which it was exposed by the high-handed measures of the British and the French governments, that caused these insults to be more or less patiently endured by the trading interests. When President Jefferson, and after him President Madison, attempted to secure redress for these injuries by the imposition of an embargo on American vessels, the West Indian trade was temporarily ruined, the war of 1812–15 with Great Britain contributing to the same end. The East Indian trade had been opened from New England ports late in the 18th century. The whaling and cod and mackerel fisheries were of earlier colonial origin. As general carriers American ships gained no importance until the Napoleonic wars; and this interest was greater in the West Indies than in Europe. Such were the main branches of national commerce up to the time of the second war with England. After the war of 1812 new outlets were found in all directions, and the commerce of the country grew apace, until in the years immediately preceding the Civil War the United States was a close second to Great Britain among the trading countries of the world. The Civil War caused enormous losses to the merchant marine, and the world-wide substitution about this time of iron steamers for wooden steamers and sailing vessels contributed to prevent a recovery; because, although ship-building was one of the earliest arts developed in the colonies, and one that was prosecuted with the highest success so long as wooden ships were the dominant type, the United States has never achieved marked success with the iron steamer, and the law has precluded the registry as American of vessels built abroad. The American "clipper" ships that were constructed at Baltimore and elsewhere during the last three decades before the Civil War were doubtless the swiftest sailers that have ever been built.

The total trade of the country by land and sea, the movement inward and outward, is shown in the following table for various years since 1861:—

Year.	Imports by Land and Sea.	Exports by Land and Sea.	Total Commerce.
	$	$	$
1861	335,650,153	249,344,913	584,995,066
1870	462,377,587	529,519,302	991,896,889
1880	667,954,746	835,638,658	1,503,593,404
1890	789,310,409	857,828,684	1,647,139,093
1900	849,941,184	1,394,483,082	2,244,424,266
1905	1,117,513,071	1,518,561,666	2,636,074,737
1909	1,475,612,580	1,728,203,271	3,203,815,851

The excess of exports over imports in the decade 1899–1908 totalled $5,728,214,844; and in the same period there was an excess of exports of gold and silver, above imports, of $444,908,963. Of the total exports of 1909 $1,700,743,638 represented domestic merchandise. The remainder, or element of foreign exports, has been of similarly small relative magnitude since about 1880, but was of course much larger while the carrying trade was of importance. From 1820 up to 1880 agricultural products made up with remarkable steadiness almost exactly four-fifths of all exports of domestic merchandise. Since then the increase of manufactures, and to a slight degree that of minerals, has lessened much the share of agricultural products, which in 1906 was 56·43 %, that of manufactures being 35·11 % and of minerals 3·09 %. The following table indicates in a general way the increased value, in round millions of dollars, of the leading agricultural exports since 1860:—

Year.	Raw Cotton.	Bread Stuffs.	Leaf Tobacco.	Meats and Dairy Products.	Cattle, and other Animals.
1860	192·0	24·0	16·0	16·9	1·8
1900	242·9	262·7	29·4	184·5	43·6
1905	381·4	107·7	29·8	200·0	46·7
1909	461·9	139·5	36·8	152·0	20·8

Classifying imports and domestic exports as of six groups: (1) crude foodstuffs and good animals; (2) foodstuffs partly or wholly prepared; (3) raw materials for use in manufacturing; (4) manufactured articles destined to serve as materials in further processes of manufacture; (5) finished manufactures; (6) miscellaneous products—the table on p. 645 shows the distribution of imports and exports among these six classes since 1820.[1]

It will be seen from the table that the share of the first two classes in both imports and exports has been relatively constant. On the other hand the great increase of imports of class III., and the great decrease of class V.; and of exports the great increase of those of class IV., and decrease of those of classes III. and V., all reflect the great development of manufactures in modern times. The table also shows the great rapidity of this change in recent years.

Europe takes, of course, a large share of the exports of finished manufactures—a little more than a third of the total in the quinquennial period 1903–1908; but North America takes but very slightly less. On the other hand, above 70 % of manufactures destined to serve as material in further processes of manufacture went, in the same years, to Europe, and from eight- to nine-tenths of the first three classes of exports. After Europe the largest shares of exports are taken by North America, Asia and Oceania, South America and Africa in order. The share of the five continental divisions in 1909 was as follows, respectively: $1,169,672,326; $344,767,613; $113,129,907; $83,509,047 and $17,124,298. The respective shares of the same divisions in the imports of the country were as follows: $763,704,486; $277,863,210; $223,254,724; $193,202,131 and $17,558,029. It will be seen that the commercial

[1] The official statistics are kept current since 1820. For the years 1789–1818 consult Adam Seybert's *Statistical Annals* (Philadelphia, 1818), which are based upon official documents, a large part of which are no longer in existence.

Years.	All Imports. Percentages by Classes.						Exports of Domestic Merchandise. Percentages by Classes.					
	I.	II.	III.	IV.	V.	VI.	I.	II.	III.	IV.	V.	VI.
1820	11·15	19·85	3·64	7·48	56·86	1·02	4·79	19·51	60·46	9·42	5·66	0·16

1890	16·28	16·89	21·62	14·81	29·23	1·17	15·62	26·59	36·03	5·50	15·68	0·58
1900	11·52	15·65	32·50	15·79	23·90	0·64	16·59	23·21	23·75	11·15	24·22	1·08
1908	12·19	12·31	30·43	16·43	27·77	0·87	10·30	18·10	30·34	14·23	26·68	0·35
1909	11·67	10·99	35·89	17·48	23·24	0·73	6·75	16·76	33·62	14·89	27·52	0·46

interests in South America are relatively small. The shares of the ten nations having the largest part in the trade of the country were as follows in 1909:—

	Imports from	Exports to
	$	$
Great Britain	247,474,104	521,281,999
Germany	161,951,673	247,310,084
Canada, Newfoundland and Labrador	88,321,706	191,438,400
France	132,069,748	126,361,959
Cuba	107,334,716	48,217,689
Brazil	117,062,725	19,765,836
Holland	30,905,712	89,121,124
Mexico	52,578,454	53,512,947
Japan	68,116,665	23,471,837
Belgium	36,236,568	44,477,380

The leading imports in 1909 were as follows, indicating in each case, when not evidently unnecessary, the value of finished manufactures and of unmanufactured materials: Silk (manufactured, $32,963,162; unmanufactured, $75,512,401); hides and skins, other than fur skins ($103,758,277); sugar and molasses ($91,535,466); fibres, vegetables and textile grasses (manufactured, $33,511,696; unmanufactured, $54,860,698); coffee ($86,524,006); chemicals ($86,401,432); cotton (manufactured, $68,380,780; raw and waste, $15,421,854); rubber (manufactured, $1,462,541, unmanufactured, $83,682,013); wool (manufactured, $22,058,712; unmanufactured, $55,530,366); and wood (manufactured, $43,620,591; unmanufactured, $13,584,172). Precious stones ($43,620,591); fruits and nuts; copper, iron and steel; tobacco (leaf $25,897,650; manufactured, $4,138,521); tin; spirits, wines and liquors; oils, paper, works of art, tea and leather ($16,270,406), being the remaining items in excess of $15,000,000 each. The leading exports of domestic merchandise in excess of the same value were the following: cotton ($496,334,448); iron and steel, excluding ores ($157,680,331); meat and dairy products ($151,964,037); petroleum, vegetable and animal oils ($126,350,916); wheat and wheat flour ($100,529,381); copper, excluding ores ($92,584,640); wood ($72,312,880); leather ($47,146,415); tobacco ($41,554,058); coal ($38,441,518); agricultural implements ($27,327,428); corn and corn meal ($27,062,128); animals ($21,007,122); chemicals ($20,330,335); oil-cake ($20,245,818); fruits and nuts ($18,707,670); vehicles ($16,774,036); naval stores ($16,103,076); and paper ($15,280,541).

New York, New Orleans, Boston, Galveston, Philadelphia, Baltimore, San Francisco and Puget Sound are, in order, the leading customs districts of the country in the value of their imports and exports. Almost one-half of the country's foreign trade is done through the single port of New York. In 1909 more than eight-tenths of all imports of the country entered by, and more than seven-tenths of all exports went out through, the eight customs districts just named. Savannah and Charleston are other great ports and southern outlets, particularly for cotton.

Of the imports and exports of 1861 two-thirds (in value) were carried in American vessels. By 1864 the proportion had fallen to 27·5%, and except for a temporary slight recovery after the close of the war there has been a steady progress downward since that time, until in 1908 only 9·8% of the commerce of the country was carried on under its own flag. More than half the shipping entering and leaving the ports of the United States in 1908 was British; Germany, the Scandinavian countries, France, Holland and Italy ranking next in order; the United States, although ranking after Great Britain, contributed less than a seventh of the total. The total tonnage entered was 38,539,195 net tons (of 100 cub. ft. each), as compared with 18,010,649 tons in 1880.

Of the total of tonnage entered in 1909, 30,443,695 tons represented seaport entries, the remainder entering across the land frontiers.

The merchant marine of the United States in 1900 totalled 5,164,839 net tons, which was less than that of 1860 (5,353,808), in which year American shipping attained an amount which only in recent years has been again reached. In the decline that followed the Civil War an apparent minimum was reached of 4,068,034 tons in 1880; but this does not adequately indicate the depression of the shipping interest, inasmuch as the aggregate was kept up by the tonnage of vessels engaged in the coasting trade and commerce of the inland waters, from which foreign shipping is by law excluded. The decline of tonnage engaged in ocean traffic was from 2,546,237 net tons in 1860 to 1,352,810 in 1880; and this decline continued in later years. On the other hand the aggregate tonnage of the country has again begun to rise, and in 1908 the total was 7,365,445 net tons, a third of this being on the Great Lakes, and somewhat under one-half on the Gulf and Atlantic coasts. Of the same total 6,371,865 tons represented the coasting trade, only 930,413 tons being engaged in the foreign trade of the country. New England still supplies a quarter of the shipping annually built along the entire seaboard of the country; but more is yearly built upon the Great Lakes than upon the seaboard.

Internal Commerce: Railways and Canals.—Large as has become the foreign commerce of the country, it is small beside the aggregate interior commerce between the states of the Union. The basis of this is necessarily facilities for transportation. At the end of 1908 the railway lines[1] of the country totalled 232,046 m.—more than those of all Europe. The traffic on these, measured in units moved one mile, was 28,797,781,231 passenger-miles, and 214,340,129,523 freight miles. Various systems, with joint or separate outlets from the Pacific coast to the Mississippi Valley, provide for the handling of transcontinental freight. Rivers and canals are relatively much less important to-day than in the middle decades of the 19th century, before the growth of the railway traffic made small by comparison the movement on the interior watercourses. According to a special report of the department of commerce and labour of 1906, 290 streams are used to a "substantial degree" for navigation, affording together an aggregate of 2600 m. of 10 ft. navigation, or 5800 m. of 6 ft. navigation at ordinary water. Of the last almost half belongs to the Mississippi river. More than $250,000,000 has been spent by the national government for the improvement of waterways, yet no general system exists, and a large part of this enormous sum has been wasted on unimportant or impossible projects, especially in recent decades, since the river navigation has been a declining interest. 1360 m. of state-owned canals and 632 m. of private canals of "some importance" were also reported as in operation in 1909. More than an equal length of canal ways (2444 m., costing $80,000,000) was reported as having been abandoned after construction. Of recent years there has been a great revival of interest in the improvement of inland waterways upon systematic plans, which promises better than an earlier period of "internal improvements" in the first half of the 19th century, the results of which were more or less disastrous for the state and local governments that undertook them, and only less so for the national government. The Erie Canal in New York, the Chesapeake & Delaware Canal, and the Sault Ste Marie Canal are the most important in the country.

Coal, iron ore, building materials, lumber, livestock, cotton, fruits, vegetables, tobacco and grain are the great items in the domestic commerce of the country, upon its railways, inland waterways, and in the coasting trade. The magnitude of these items is so great as to defy exact determination; data for the formation of some idea of them can be found in the account of the mineral, forest and agricultural resources of the country. It was estimated by the Bureau of the Census that in 1906 the tonnage of freight moved by American vessels within American waters, excluding harbour traffic, was 177,519,758 short tons (as compared with 1,514,906,985 long tons handled by the railways of the country). Of this total 42·6% was moved on the Great Lakes, and 36·8% on the Atlantic and Gulf coasts and waterways.

The Great Lakes are connected by canals with the Atlantic, the St Lawrence river and the Mississippi; the connexion with the first being through the Erie Canal, a 7-ft. waterway, and that with the St Lawrence through Canadian canals that afford a 14-ft. navigation. The connexion with the Mississippi is through the drainage-canal

[1] See further RAILWAY.

of Chicago, and thence into branches of the Mississippi affording as yet even less water than the Atlantic outlet. The commerce on the lakes is largely in grain, coal, iron and lumber. The tonnage of vessels cleared between American ports on the lakes in 1908 was 103,271,885 net tons; the freight they carried came to 80,974,605 long tons. Vessels aggregating 46,751,717 net tons, carrying 57,895,149 tons of freight, valued at $470,141,318, passed through the Sault Ste Marie Canal and 47,621,078 tons of freight were moved through the Detroit river in the same year. In these figures no account is taken of the trade of the Canadian ports on the lakes. Compared with this volume of traffic the movement through the Suez Canal is small.

It has been estimated by O. P. Austin, chief of the national bureau of statistics, using data of 1903, that the internal commerce of the United States exceeds in magnitude the total international commerce of the world. (F. S. P.)

VII.—Constitution and Government

I.—*Introductory.*

§ 1. A description of the government of the United States falls naturally into three parts:—

First, an account of the states and their governments.

Second, an account of the Federal system, including the relation of the states as communities to the Federation as representing the whole nation.

Third, an account of the structure and organization of the Federal government considered as the general government of the nation.

As the states are older than the Federal government, and as the latter was, indeed, in many respects modelled upon the scheme of government which already existed in the thirteen original states, it may be convenient to begin with the states and then to proceed to the national government, whose structure is more intricate and will require a fuller explanation.

Before entering, however, on a description of the state governments, one feature must be noticed which is common both to the states and to the Federation, and gives to the governmental system of both a peculiar character, different from that of the government of Great Britain. This feature is the existence of a supreme instrument of government, a document, enacted by the people, which controls, and cannot be altered by, any or all of the ordinary organs of government. In Great Britain parliament is the supreme power, and can change any of the laws of the country at any moment. In the American Union, and in every state of the Union, there exists a documentary or rigid constitution, creating and defining the powers of every authority in the government. It is the expression of the ultimate sovereignty of the people, and its existence gives to the working both of the Federal government and of the several state governments, a certain fixity and uniformity which the European, and especially the British, reader must constantly bear in mind, because under such a constitution every legislative body enjoys far scantier powers than in the United Kingdom and most European countries.

II.—*The State Governments.*

Origin of the American State.

§ 2. The state is the oldest political institution in America, and is still the basis and the indestructible unit of the American system. It is the outgrowth from, or rather the continuation of, the colony, as the latter existed before the Declaration of Independence in 1776. In every one of the North American colonies there was in operation at that date a system of self-government, in seven colonies under a charter from the Crown. In each there was a governor, with minor executive officers, a legislature, and a judiciary; and although the Crown retained the power of altering the charter, and the British parliament could (in strict legal view) legislate over the head of the colonial legislature so as to abrogate statutes passed by the latter, still in practice each colony was allowed to manage its own affairs and to enact the laws it desired. Thus the people were well accustomed to work their institutions, and when they gained their independence continued to maintain those institutions with comparatively little change. In two colonies, Rhode Island and Connecticut, the colonial charter was substantially maintained as the constitution of the state for many years, in the former case till 1842, in the latter till 1818.

Rights and Powers of a State.

§ 3. Each state was under the Confederation of 1781 sovereign (except as regarded foreign relations), and for most purposes practically independent. In adopting the Federal Constitution of 1787–1789, each parted with some of the attributes of sovereignty, while retaining others. Those which were retained have been to some extent diminished by the 14th and 15th amendments to the Constitution, and if the right to secede from the Union ever existed (a point much controverted), it was finally negatived by the Civil War of 1861–65. Otherwise, however, these attributes survive. The powers of a state are inherent, not delegated, and each retains all such rights and functions of an independent government as it has not, by entering the Union, affirmatively divested itself of in favour of the Federal government. Each has its own documentary constitution; its legislature of two elective houses; its executive, consisting of a governor and other officials; its judiciary, whose decisions are final, except in cases involving Federal law; its system of local government and local taxation; its revenue, system of taxation, and debts; its body of private civil and criminal law and procedure; its rules of citizenship, which may admit persons to be voters in state and national elections under conditions differing from those prevailing in other states.

The rights and functions of a state practically cover the field in which lie most of the relations of private citizens to one another and to the authorities with which they come into contact in daily life. An American may through a long life never be reminded of the Federal government, except when he votes at Federal elections (once in every two years), lodges a complaint against the post office, or is required to pay duties of customs or excise. His direct taxes are paid to officials acting under state laws. The state (or a local authority created by the state) registers his birth, appoints his guardian, provides schools for him and pays for them, allots him a share in the property of a parent dying intestate, licences him when he enters a trade (if the trade needs a licence), marries him, divorces him, entertains civil actions against him, tries and executes him for murder. The police that guard his house, the local boards which care for the poor, control highways, provide water, all derive their powers from the state. Nevertheless the state is (as will be explained later) a slightly declining factor in the public life of the nation, because public interest tends more and more to centre in the Federal or national government.

State Constitutions.

§ 4. The constitution of each state is framed and enacted by the state itself, without any Federal interference, save that the Federal Constitution requires that the Constitution under which a new state seeks admission to the Union must be "republican"; and under this requirement, Congress has seemed to assume a right of making the adoption, or omission, of any particular provision in a state constitution a condition of the admission of that particular state. Even in these cases, however, the constitution derives its force not from the national government, but from the people of the state. The invariable method of forming a constitution is for the citizens to elect by special popular vote a body called a convention to draft the document, which, when drafted and circulated, is usually, though not quite invariably, submitted to popular vote. This is done either when a state is to be formed out of a Territory (as to which see *post*, § 10), or when an existing state desires to give itself a new constitution.[1]

A state constitution usually consists of the following parts:—

A description of the state boundaries (now frequently omitted);

A bill of rights, defining the so-called "primordial rights" of the citizens to security of life, liberty and property;

A declaration and enactment of the frame of state government, *i.e.* the names, functions and powers of the houses of the legislature,

[1] Details as to state constitutions will be found in J. Bryce, *American Commonwealth*, chs. xxxvii.–xxxix., which is referred to here and subsequently as containing a fuller treatment of all the topics dealt with in this article. Further details may be found also in the articles on the separate states.

the chief executive officials, and the courts of justice, with provisions regulating the electoral franchise;

Provisions creating, or directing the creation of, a system of local government for cities and rural areas;

Miscellaneous provisions relating to law and administration, including the militia, revenue and taxation, state prisons and hospitals, agriculture, banking and other corporations, railways, labour questions;

Provisions for the amendment of the constitution;

A schedule prescribing the method of submitting the draft constitution to the vote of the people, with temporary provisions regulating the mode of transition from the old constitutional arrangements to the new ones.

The method of amending the constitution varies in detail from state to state, but that most usual is for the legislature to propose amendments, often by a prescribed majority, and for these amendments to be voted on by the people. Such amendments have latterly come to include many matters not strictly constitutional, and so to constitute a species of direct legislation by the people similar in principle to what is called in Switzerland the Referendum. Some states have recently allowed a prescribed number of voters to propose, by what is called the Initiative, amendments which are submitted to the vote of all the citizens without the intervention of the legislature.

Two remarkable changes have passed over the state constitutions. In the earlier days of the republic they were comparatively short and simple instruments, confined to the definition of civic rights and the establishment of a frame of government. They have now become very long and elaborate documents, seven, eight or ten times as long as the Federal Constitution, and containing a vast number of provisions on all sorts of subjects, many of them partaking of the nature of ordinary statutes passed by a legislature rather than safeguards suitable to a fundamental instrument. And secondly, whereas in earlier days the constitutions were seldom changed, they are now frequently recast or amended. Only Maine and Massachusetts and a few of the newer states live under original constitutions, and only Massachusetts is under a constitution older than the 19th century. Some have recast their constitutions seven or eight times. Some provide for the revision of the constitution at stated intervals. Notwithstanding the facility and frequency of amendments, the variations between one constitution and another are less conspicuous than might have been expected. There is, however, a distinction of type and character between those of the western and southern and those of the eastern states, the former being generally more prolix, more prone to go into details, more apt to contain new experiments in legislation.

Comparing the old constitutions with the new ones, it may be said that the note of those enacted in the first thirty or forty years of the republic was their jealousy of executive power and their careful safeguarding of the rights of the citizen; that of the second period, from 1820 to the Civil War (1861–65), the democratization of the suffrage and of institutions generally; that of the third period (since the war to the present day), a disposition to limit the powers and check the action of the legislature, and to commit power to the hands of the whole people voting at the polls.

State Legislatures.

§ 5. In every state the legislature consists of two houses. This remarkable feature, originally due to the practice that had prevailed in some colonies, and to the example of Great Britain, soon became universal, and the belief in its necessity has passed into a fundamental dogma, the idea being that a single chamber would be either hasty, or tyrannical or unscrupulous—perhaps all three—so that there must always be a second chamber to keep the first in order. The smaller house is called the Senate, the larger one is (usually) called the House of Representatives, sometimes, however, the Assembly—sometimes the House of Delegates. Both are chosen by popular vote, almost universally by the same voters, and usually in single-membered districts, and at the same time. The senatorial districts are, of course, larger than the house districts. A senator is usually chosen for a longer term (often four years) than a representative, and, in most cases, whereas the house is elected all at once, the senate is renewed only partially at each election. In some states by law, and in all by custom also, a member must reside in the district which he represents.

Universal manhood suffrage, subject to certain disqualifications (*e.g.* certain crimes or receipt of poor relief), is the rule in the great majority of states. Certain terms of residence within the United States, in the state, and in the voting district are generally prescribed, the periods varying from state to state. Nine states allow voting rights to aliens who have declared their intention to become citizens, and in some they can as taxpayers vote on financial matters submitted to a special vote. Kansas grants them a full municipal suffrage. Fourteen prescribe some sort of educational qualification. Five states—Wyoming, Colorado, Utah, Idaho and Washington—give the suffrage for all elections to women.[1] In 1905 women could vote at school elections in twenty-four states. Of late years seven Southern states, beginning with Mississippi (constitution of 1890) and including Virginia, North Carolina, South Carolina, Georgia, Alabama and Louisiana, have so altered their constitutions as to exclude from voting the great bulk of their respective negro populations, by means of educational tests, property qualifications, a combination of both, or by other means, while various ingenious devices have been employed to admit a large part, at least, of the illiterate whites. In 1910 Oklahoma adopted provisions of the same kind. The suffrage for legislature elections generally determines that for all other elections within the state, and as a rule it carries with it eligibility to office. And by the Federal Constitution it is also the suffrage for Federal elections, viz. elections of representatives in Congress and of presidential electors.

Elections are now practically everywhere conducted under that system of secret voting, which is called in America "the Australian ballot," and which is very similar to that used in the United Kingdom since 1872. There used to be a good deal of fraud practised at elections, including "personating" and "repeating," as well as a good deal of bribery in a few states and in some of the larger cities. Legislation has reduced these evils in recent years; and efforts have been made to prevent the excessive expenditure of money at elections, and the making of contributions to party "campaign funds" by wealthy corporations who desire to secure some benefit for themselves. Another evil which has not yet been dealt with is the large number of posts for which the voter is expected at an election to select the best men. This, of course, does not apply to elections to a legislature; but in city elections, and to some extent in state elections and county elections also, it creates great difficulties, for how is the average citizen to know (especially in a large city) who are the fittest men out of a long list of candidates for perhaps ten or twenty offices, all of which have to be filled by election at the same time? The perception of these difficulties has evoked a movement for what is called "a short ballot."

The number of members of the legislative chambers varies from state to state. Delaware with 17 senators and 35 representatives, has the smallest; Minnesota, with 63 senators, has the largest Senate; and New Hampshire (a small state) has, with its 390 representatives, the largest House. The New York houses number 51 and 150 respectively; those of Pennsylvania, 50 and 204; of Illinois, 51 and 153; of Ohio, 34 and 118; of Massachusetts, 40 and 240. In all states, members of the legislature receive a salary, which is the same for both houses, some states fixing an annual sum, but most preferring a per diem rate, while the maximum is generally determined by a limitation on the length of the session.

It has become the wish of the people in most places to have sessions both short and few. Whereas formerly legislatures met annually, regular sessions are now biennial except in New York, New Jersey, Massachusetts, Rhode Island, Georgia and South Carolina—all original states. In Alabama the legislature meets regularly once only in four years, though it may be convoked in the interval.

Powers and Functions of the State Legislatures.

The Senates act as courts for the trial of state officers impeached by the house (in imitation of the British House of Lords and the Federal Senate), and have in some states the function of confirming or refusing appointments made by the governor. Otherwise the powers and procedure of the two houses are everywhere substantially identical, though it is worth noting that whereas every house chooses its own Speaker, the president of

[1] Woman suffrage amendments to state constitutions have been rejected by the people in at least twelve states and in two territories. State organizations of women to oppose the extension of the suffrage to women exist in Illinois, Massachusetts, New York and Oregon: possibly in other states also.

the Senate is, in most states, a lieutenant-governor, whom the people have directly elected. Bills may originate in either house, but in about half of the states money bills must originate in the House of Representatives—a survival of British custom which has here, where both houses equally represent the people, no functional value. Both houses do most of their work by committees, much after the fashion (to be presently described) of the Federal Congress, and it is in these committees that the form of bills is usually settled and their fate decided. Sometimes, when a committee is taking evidence on an important question, reporters are present, and the proceedings receive comment in the newspapers; but in general the proceedings of committees and even debates in the houses are imperfectly reported and excite no great public interest. In all the states except one, viz. North Carolina, bills passed by the two houses must be submitted to the state governor for his approval. Should he return it to the legislature disapproved, it is lost unless repassed "over his veto" by a majority usually of two-thirds, but sometimes larger, in each house. A good governor is apt to use his veto freely—indeed, a frequent exercise of the power is deemed in many states to be a sort of test of the governor's judgment and courage.

Subjects of state legislation may be classified under three heads:—

1. Ordinary private law, including property, contracts, torts, family relations, offences, civil and criminal procedure.

2. Administrative law, including the regulation of urban and rural local government, state and local taxation and finance, education, public works, the liquor traffic, vaccination, adulteration, charities, asylums, prisons, the inspection of mines and factories, general laws relating to corporations, railways, labour questions.

3. Matters of a local or special nature, such as bills for chartering and incorporating gas, water, canal, tramway, railway or telephone companies, or for conferring franchises in the nature of monopolies or special privileges upon such companies, or for altering their constitutions, as also for incorporating cities or minor communities and regulating their affairs. Although there usually exist general laws under which corporations or companies (including railway and electric car companies) can be formed, laws which in some states and for some purposes confer a greater freedom of incorporation than the general law allows in the United Kingdom, there is nevertheless a noticeable tendency to come to the legislature for special purposes of this kind.

As respects class 1, there is not much change in the law from year to year. The legal profession does not like to see the ordinary and established rules disturbed. Sometimes the laws belonging to this class are codified, or rather consolidated, and then usually by a special committee of competent lawyers whose work is passed *en bloc* by the legislature.

As respects class 2, a good many measures are passed, particularly in matters affecting labour, and for the protection of any sections of the population which may be deemed to need protection.

It is, however, in class 3 that the legislatures show most activity, much of it pernicious, because prompted by persons seeking to serve private interests which are often opposed to the interests of the whole community. The great "public service" corporations have, in particular, frequently succeeded in obtaining franchises of large pecuniary value without making any adequate payment therefor. A peculiarly notable form of this special or private bill legislation is that of dealing by special statutes with the governmental forms and details of management of municipalities; and the control exercised by the state legislatures over city governments is not only a most important branch of legislative business, but at the same time a means of power to scheming politicians and of enrichment to greedy ones. This has led in some states to the grant of power to cities to frame their own charters. Speaking generally, it is chiefly in the sphere of special or private legislation that state legislatures have shown their weak side, and incurred, in many states, the distrust of the people.

The members of these bodies belong for the most part, though by no means entirely, and least so in the agricultural states, to the class of professional politicians. They are seldom persons of shining ability or high standing in their communities. Except as a stepping-stone to a seat in Congress or a high executive post, the place is not one which excites the ambition of aspiring men. The least respected legislatures are those of the richest and most populous states, such as New York and Pennsylvania, because in such states the opportunities offered to persons devoid of scruple are the largest.

The general decline in the quality of these bodies, and especially their proneness to pass ill-considered or pernicious bills at the instance of private promotors, has led to the restriction in recent years of their powers by the insertion in the state constitutions of many provisions forbidding the enactment of certain classes of measures, and regulating the procedure to be adopted in the passing, either of statutes generally or of particular kinds of statutes. Even these provisions, however, are frequently evaded.

The State Executive.

§ 6. At the head of every state government stands an official called the governor, who is the descendant and representative of the governor of colonial times. Under the earlier constitutions of most of the original thirteen states he was chosen by the legislature, but he is now everywhere directly elected by the people, and by the same suffrage as the legislature. His term of office is four years in twenty-three states (including Pennsylvania and Illinois), three years in one state, two years in twenty, and one year in two (Massachusetts and Rhode Island). In a few states there are prohibitions on re-election.

It is the duty of the governor to see that the laws of the state are faithfully administered by all officials, and the judgments of the courts carried out. He has, in most states, the right of reprieving or pardoning offenders, but some recent constitutions place restrictions on this power. He is also commander of the militia or other armed forces of the state, which he can direct to repel invasion, or suppress insurrection or riot. He appoints some of the state officials, his nominations usually requiring the concurrence of the state senate; but his patronage is in most states not very large—in many it is indeed insignificant—because the offices of greatest importance are filled by direct popular election. He has also the almost mechanical function of representing the state for various formal purposes, such as demanding from other states the extradition of offenders, the issuing of writs for the election of members of the legislature and of members of the Federal House of Representatives, and the receiving of reports from various state officials or boards.

Not less important than his directly executive work is the influence which the governor exerts upon state legislation through his possession (in all the states but one) of a veto power. His right of recommending measures to the legislature (which does not formally include that of framing and presenting bills, but practically permits him to have a bill prepared and use all his influence on its behalf) is of greater value according to the extent to which he leads the public opinion of his state. The legislature need not regard his counsels, but if he is a strong man whom the people trust, it may fear him and comply with his demands. When a commercial crisis occurs much may depend on his initiative. Moreover, his veto is a thing to be reckoned with. It is seldom overridden by the prescribed majority, especially if the bill against which it is directed be one of a jobbing nature. And as the people look to him to kill bad measures, he is frequently able, if he be a man both strong and upright, to convey intimations to the legislature, or to those who are influential in it, that he will not approve of certain pending measures, or will approve of them only if passed in a form satisfactory to him. The use of this potential authority, which the possession of the veto power gives, has now become one of a governor's most important duties.

In New England, and in the greater states generally, the governorship is still a post of dignity, and affords an opportunity for a display of character and talents. During the War of Secession, when each governor was responsible for organizing troops from his state, much turned upon his energy, popularity and loyalty. And in recent years the danger of riots during strikes has, in some states, made it important to have a man of decision and fearlessness in the office which issues orders to the state militia. There has been of late years a revival in the case of some able governors of the old respect for, and deference to, the office.

In thirty-five states there is a lieutenant-governor, elected by popular vote. He is usually president of the state senate, is sometimes a member of some administrative boards, and steps into the governor's place should it become vacant.

Executive councils advising the governor, but not chosen by him, existed under the first constitutions of all the original thirteen states. In New York the council of appointment advised the governor only in regard to appointing officers; and in Georgia there was no executive council after 1789. True executive councils have now disappeared except in Massachusetts, Maine and New Hampshire.

§ 7. The names and duties of the other officers vary from state to state. In every state there are a secretary of state, who is custodian of the documents and archives, and a treasurer. Nearly everywhere there are also a comptroller or auditor, who keeps the accounts and is the principal financial officer, an attorney-general or legal adviser, an adjutant-general, who has immediate charge of the militia, and a superintendent of public instruction, with some little authority over the public schools. Most of the states have also a board of charities, a board of health, a board of railway commissioners, and either boards or single commissioners for banking, insurance, agriculture, public lands and prisons. Other administrative departments found in different states are those having control of public works—principally canals—insane hospitals, factory inspection, labour statistics and immigration. New York state, with nearly fifty different administrative bureaus, has a larger number than any other state. In many states the most important of these officials are elected by the people at a general election, but some officials are either chosen by the legislature or appointed by the governor, the latter method applying mainly to offices of recent creation. The terms of office vary for the different offices, very few exceeding four years. The state officials, being thus largely independent of the governor, and responsible only to the people, are in no sense a cabinet (save in North Carolina). Each administers his own department, subject to the detailed regulation imposed by statutes, and as these statutes determine such matters as might come into controversy, a general agreement in policy among the administrative officials is not essential.

Administrative Offices in a State.

In many states officials may be removed, not only by impeachment, but also sometimes by vote of the legislature, sometimes by the governor on the address of both houses, or by the governor either alone or with the concurrence of the senate; but such removals must be made for specific misconduct.

The extent of direct state administration of public institutions and works is very limited, and most of the state bureaus have only a supervision over private enterprises, or over local administrative officers. On this account the subordinate civil service of the state is not large compared with that of either the Federal government or of the large municipalities, and only in a few states does it possess any importance. However, these bureaus are seldom well manned, because salaries and tenure of office are seldom such as to induce able men to offer themselves, while the places are often given as rewards for political service. New York, Massachusetts and a few other states have systems of civil service examinations, similar to those in the Federal administration, which serve to keep certain branches out of politics.

§ 8. The judiciary is in every state an independent department of the government, directly created by the state constitution, and not controlled in the exercise of its functions either by the legislature or by the executive. In every state it includes three sets of courts: a supreme court or court of appeal; superior courts of record; and local courts, but the particular names and relations of these several tribunals vary greatly from state to state. Most of the original thirteen colonies once possessed also separate courts of chancery; and these were maintained for many years after the separation from Great Britain, and were imitated in several of the earlier among the new states, but special chancery courts now exist only in a few of the states, chiefly in the East and South. In other states the common law judges have also equity jurisdiction; and in four states—New York, North Carolina, California and Idaho—there has been a complete fusion of law and equity.

The State Judiciary.

In colonial days the superior judges were appointed by the governors, except in Rhode Island and Connecticut, where the legislatures elected them. These precedents were followed in all the revolutionary constitutions, except in Georgia, where election by the people was established. During the democratizing period from 1820 to 1860 the system of popular election was extended, especially in the new states, and at present this system prevails in thirty-six states, including practically all of the new states and five of the original states—New York, Pennsylvania, Maryland, North Carolina and Georgia. Three of the original thirteen have their judges elected by the legislatures, and in five others, together with Maine and Mississippi among the newer states, they are appointed by the governor, subject to the approval of the executive council, the Senate, or (in Connecticut) the General Assembly. Local judges are generally chosen by the voters of the district in which they hold court.

Originally the superior judges were in most states appointed for life and held office during good behaviour, but only three states now retain this system. Eight to ten years is the average term of service; it is longer in New York (14), Maryland (15), and Pennsylvania (21), where alone superior judges are not re-eligible. Salaries, too, are small in most states, often not more than one-tenth of what a prominent lawyer can make by private practice.

These three factors—popular election, limited terms and small salaries—have all tended to lower the character of the judiciary; and in not a few states the state judges are men of moderate abilities and limited learning, inferior (and sometimes conspicuously inferior) to the best of the men who practise before them. Nevertheless, in most states the bench is respectable in point of character, while in some it is occasionally adorned by men of the highest eminence. The changes introduced since 1870 have been, on the whole, for the better, though there is still room for further improvement. Corruption seems to be very rare, but instances of subservience to powerful political groups sometimes shake public confidence. Things would doubtless have become worse but for the watchfulness which the bar generally shows in endeavouring to secure the selection of honest and fairly competent men. The administration of civil justice is decidedly better than that of criminal justice. The latter is in many states neither prompt nor certain, offenders frequently escaping through the excessive regard for technicalities even more than through the indulgence of juries and the occasional weakness of judges.

It must be remembered that the courts of each state form a judicial system, complete in itself, and independent of the Federal courts, and, of course, of other states. There is no appeal from the highest state court, except in those cases where a question of Federal law is involved, for then such cases may be removed, in manner to be explained hereafter, to the Federal courts. And, subject only to this limitation, the jurisdiction of the state courts covers the entire field of civil and criminal law. The existing legal system of all the states, except Louisiana, whose law is based on the Roman, have been built upon the foundation of the principles contained in the common and statute law of England as that law stood in 1776, when the thirteen colonies declared their independence. In the development of the law since that time the courts of one state are not bound either by law or by usage to follow the decisions either of the Federal courts or of the courts of any other state, any more than they would follow English courts, although such decisions are used and discussed as evidence of the common law, and great deference is always shown to the opinions expressed by the Federal courts. In many states the legislatures have taken action in the development of law by adopting statutory codes of procedure, and in some instances have even enacted codes embodying the substance of the common law fused with the statutes. These latter codes have not, however, received the general approval of the legal profession.

It is, of course, to the state courts that the duty belongs of construing the constitution as well as the statutes of the state, and if they find any state law to be inconsistent with the state constitution it is their duty to declare it invalid. It is also the duty of the state court to declare any state law invalid if it is contrary to the Federal constitution or to a Federal statute or treaty. As in the case of the similar power of the Federal judges, this is founded on no special commission, but arises out of the ordinary judicial function of expounding the law and discriminating between the fundamental law and laws of inferior authority (see *post*, § 25).

§ 9. Wide as is the range of the rights and powers of a state, and elaborate as is the structure of its government, the state holds a practically less important position in the American system than it once did, and has not so strong a hold as it had in the first quarter of the 19th century upon the loyalty and affection of its citizens. The political interest and the patriotism of the people generally are now given rather to the nation as a whole than to a state, whereas in the two generations following the Revolutionary War the opposite would have been the case. This notable difference is due not to any constitutional changes, for there has been none except those contained in the 13th, 14th and 15th amendments to the Constitution, but to the three following causes:—

Change in the Political Importance of the State.

The first is the growth of the party system with its complicated machinery, which has linked the citizens of different states more closely together, and has led to the eclipsing of political issues confined to a state by issues which are matters of controversy throughout the nation.

The second cause is the Civil War of 1861–65, which practically negatived the far-reaching claims of state sovereignty and the right of secession made by statesmen of the type of Calhoun, and showed that the nation was really much stronger than any group of states.

The third is the enormous development of swift and cheap communications by land and water, and the growth of commerce and of productive industry, which have brought every part of the country into much closer relations with every other part, and have increased the sense of economic solidarity.

The Territories.

§ 10. During the entire history of the United States there has been a considerable area within the jurisdiction of the Federal government not included in that of any one or more of the states; and the systems of government for the various parts of this area require some description. The Territories (strictly so called) were at one time important, though now less so, because there remain only two, the unorganized Territory or District of Alaska, and the Hawaiian Islands in the Pacific Ocean. Till 1910 there were the two organized Territories of Arizona and New Mexico, but in that year Congress passed an act for their admission as states. Previously to that year there had been ever since 1787 a large area of the continent which, while belonging to the United States, was deemed too thinly peopled to be fit to be divided up into states. Parts of this area were, however, set off and organized as Territories, receiving a qualified form of self-government while under the ultimate control of Congress for the purposes of legislation. When these parts had been sufficiently filled up by settlers, they were allowed to organize themselves as states, each giving itself a constitution. The Territorial government consisted of a legislature of two houses elected by the people, with a governor appointed by the president of the United States, with the consent of the Senate, and judges similarly appointed. The Territories were not represented in Congress, but each could send a delegate to the House of Representatives, who could speak there but not vote.

Since the Spanish War of 1898 there have been added to the United States various transmarine dominions, none of which has been formed into a state, or is likely to be so formed for a good while to come; and there is also one small piece of original area of the United States, viz. the District of Columbia, which is outside any state, because it contains the national capital. The transmarine dominions are Alaska, the Hawaiian Islands, Porto Rico, the Philippine Islands, and the Canal Zone on the Isthmus of Panama.

III.—*Local Government.*

Rural Local Government.

§ 11. Every state in the Union has its own system of local administrative areas and local authorities, working under its own laws, these systems agreeing in many points with one another, and differing in many others. Three main types of rural local government may be distinguished, prevailing in different regions. The first is characterized by its unit, the town or township, and exists in the six New England states. The second is characterized by a much larger unit, the county, and prevails in the southern states. The third may be called the mixed system, combining some features of the first with some of the second, and is found under a considerable variety of forms in the middle and north-western states. The different types spring from the original differences in the character of the colonists who settled on the Atlantic coast, and in the conditions under which the various colonial communities developed. (See *American Commonwealth*, chs. xlvii. and xlix.)

The *town*, or township, of New England is generally a rural community occupying a comparatively small area, and with a population averaging about 3000, but ranging from 200 in newly-settled districts or thinly-peopled hilly districts up to 17,000 in the vicinity of large cities and in manufacturing neighbourhoods. Each town is governed by the town meeting, an assembly of all the qualified voters within the limits, which meets at least once a year in the spring, and also at other times when specially summoned. This assembly elects the town officials at the annual meetings, but it is much more than an electoral body. It is also a deliberative assembly and the legislative authority for local matters. It enacts by-laws and ordinances, receives the reports of the local officials, passes their accounts, manages the town property, votes appropriations for each item of expenditure, and authorizes the necessary taxation. Every resident citizen has the right to bring forward and to speak in favour of any proposal. The meeting is presided over by a chairman called the moderator. In rural communities the attendance is usually good, the debates are sensible and practical, and a satisfactory administration is generally secured. But when the town meeting has grown to exceed seven or eight hundred persons, and especially when the farming class of native American stock has been replaced by factory operatives of other nationalities, the institution works far less perfectly.

The town officials consist of the "selectmen" (usually three, five or seven, sometimes nine), the town clerk, treasurer, assessors, tax collector, school committee men, and the holders of divers minor offices according to local needs. These are elected annually, except that in some cases the "selectmen" and school committee have a term of several years, one member of each board being elected annually. The "selectmen," who receive no regular salary, but may charge for expenses actually incurred, form a sort of directory or executive committee, which manages the ordinary administrative and financial business under such instructions as may have been given by the town meeting.

In the Middle and Western states the township is a more artificial organism than the rural town of New England. In one group of states—Pennsylvania, New Jersey, New York, Ohio, Indiana, Iowa—while the township has more or less power, and there are town officials, there is no town meeting. In another group—Michigan, Illinois, Wisconsin, Minnesota, the two Dakotas—the town meeting reappears, though in a less primitive and less perfect form. In the states west of the Alleghanies each township covers an artificial area 6 m. square, and a separate quasi-municipal organization is usually provided for the villages which have grown up in many townships.

The *county* is to be found in every state of the Union, but its importance varies inversely with the position held in the system of local government by that smaller and older organism, the town. In New England the county was originally an aggregation of towns for judicial purposes, and in that part of the Union it is still in the main a judicial district. There is no general representative council or board, but judicial officers, a sheriff and a clerk, are elected in each county, and also a county treasurer and county commissioners. The latter have the management of county buildings, such as court-houses and prisons, have power to lay out new main highways, to grant licences, and to apportion among the towns and cities the taxation necessary to meet county expenses. Besides these officials there are generally to be found in New England a county school superintendent and an overseer of roads. In the Southern states the county is the local administrative unit, and in addition to its original judicial and financial functions it has now also control over public schools, the care of the poor and the construction and management of roads. County government is generally vested in a board of county commissioners, elected (in almost every state) by the people, and in various officials also directly elected. In some Southern states some counties have been subdivided into school districts, each of which elects a school committee, and from this nucleus there may possibly develop something resembling the New England town. In those Middle and Western states where the town meeting is not found, the functions and officials of the county tend to resemble those existing in the Southern states, while even in those parts of the west where the town meeting is found the county remains more important than in New England. Thus in many of these states poor relief is a county and not a town charge. In most states county administration belongs to a small board of three commissioners elected for the county at large, but in New York, Michigan, Illinois and Wisconsin there is a larger board of supervisors elected by townships and cities within each county. Although local affairs do not now enlist, even in New England, so large a measure of interest and public spirit as the town system used to evoke in Massachusetts, Rhode Island and Connecticut in the 'thirties, still, broadly speaking, the rural local government of America may be deemed satisfactory. The administration is fairly cheap and fairly efficient, most so, on the whole, in the Northern and Western states, while jobbery and corruption are uncommon. The value of local self-government as a training for the duties of citizenship has been very great, and in many parts of the country, especially where the funds dealt with are small, elections are not fought and offices not distributed upon party lines.

City Government.

§ 12. The tendency, now so marked in nearly all civilized countries, to the development of urban communities has been nowhere more marked than in the United States. The increase in the range and importance of municipal functions has been not less striking than the growth of urban population. This can best be illustrated by the figures of municipal expenditure. In 1810 the annual budget of New York city—with a population of 100,000—was $100,000; to-day an average city of 100,000 population has an annual expenditure of from $1,000,000 to $2,000,000, and the total expenditure of the city of New York in 1909 exceeded $150,000,000. Municipal government is therefore a matter of high concern to America, and plays a large part in any study of American political institutions.

The historical origin of American municipal government is to be found in certain boroughs which had been chartered in the colonial period, after the fashion of English boroughs. These American corporations had the usual English system of borough government, consisting of a mayor, aldermen and councilmen, who carried out the simple administrative and judicial functions needed for the then small communities. The basis for the government of each American city is still a charter, but since the Revolution these charters have been granted by the state legislatures, and are subject to constant change by statute. The charters of cities have shown the same process of increasing length and detailed regulation as the state constitutions; and in details there are many differences between different cities. In some states cities are now permitted to enact their own charters. (See *American Commonwealth*, chs. l.–lii.)

As a rule, one finds (1) a mayor, elected directly by the voters within the city, who is the head of the administration; (2) administrative officers or boards, some directly elected by the city voters, others nominated by the mayor or chosen by the council; (3) a council or assembly, consisting sometimes of two, but more frequently of one chamber, elected directly by the city voters; and (4) judges, usually elected by the city voters, but sometimes appointed by the state.

The mayor is by far the most important official in the city government. He is elected usually for two years, but sometimes for one, three or four (in New York his term is now four years). He has almost everywhere a veto on all ordinances passed by the council, modelled on the veto of the Federal president and of a state governor. In many cities he appoints some or all of the heads of the administrative departments, usually with the approval of the council, but in some important cities the mayor has an absolute power of appointment. As the chief executive officer, he preserves the public peace. In practice he is often allowed to exert a certain discretion as to the enforcement of the laws, especially those providing for Sunday closing, and this discretion has sometimes become a source of mischief. He usually receives a considerable salary, varying with the size of the city.

The practical work of municipal administration is carried on by a number of departments, some under single heads, and some under boards or commissions. The number and classification of these departments vary widely in the different cities. The board of education, which controls the public schools, is usually largely independent of the council, and in some important cities has an independent power of taxation. In Boston, St Louis, Baltimore, and some few other cities, the police board (or commissioner) is appointed by the governor because police matters had been mismanaged by the municipal authorities and occasionally allowed to become a means of extortion and a door to corruption.

The city councils pass local ordinances, vote appropriations, levy taxes and generally exert some control over appointments to administrative positions. The recent tendency has been, however, to decrease the powers of the council and to increase those of the mayor. In some cities the mayor has received an absolute power of appointment; the departments, especially the boards of health, have large ordinance-making powers; statutes passed by the state legislature determine (excepting the states where cities can make their own charters) the principal lines of municipal policy, and the real control over appropriations and taxes is occasionally found vested in a board of estimate, consisting of the mayor, comptroller (the chief financial officer), and a few other administrative officials. In New York City, where the council had lost public confidence, and in some other places, the only important power still possessed by the council is that of granting franchises to street railways, gas companies and the like. In the smaller cities, however, the councils have retained a wider measure of authority. In 1902 the city of Galveston, in Texas, adopted a new form of municipal government by vesting all powers in a commission of five persons, elected by the citizens on a "general ticket," one of whom is mayor and head of the commission, while each of the others has charge of a department of municipal administration. A similar plan, differing in some details, was subsequently introduced in the city of Des Moines, in Iowa; and the success which has attended this new departure in both cities has led to its adoption in many others, especially, but not exclusively, in the Western states. In 1910 more than seventy cities were so administered. Under it administration would appear to have become both more pure and more efficient. The functions of city government may be distributed into three groups: (*a*) Those which are delegated by the state out of its general coercive and administrative powers, including the police power and the granting of licences; (*b*) those which, though done under general laws, are properly matters of local charge and subject to local regulation, such as education and the relief of the poor; and (*c*) those which involve no questions of policy, but are of a purely business nature, such as the paving and cleansing of streets, the construction and maintenance of drains, the provision of water, &c.

Initiative, Referendum and Recall.

It is here proper to advert to a remarkable extension of direct popular government which has in recent years been applied both to states and to cities. Several state constitutions now contain provisions enabling a prescribed number (or proportion) of the voters in a state or city to submit a proposition to all the registered voters of the state (or city) for their approval. If carried, it takes effect as a law. This is the Initiative. These constitutions also allow a prescribed number of voters to demand that a law passed by the state legislature, or an ordinance passed by the municipal authority, be submitted to all the voters for their approval. If rejected by them, it falls to the ground. This is the Referendum. Some cities also provide in their charters that an official, including the mayor or a member of the council, may be displaced from office if, at a special election held on the demand of a prescribed number of the city voters, he does not receive the largest number of votes cast. This is the Recall. All these three institutions are in operation in some Western states and are spreading to some of the Eastern cities. Their working is observed with lively interest, for they carry the principle of direct popular sovereignty to lengths unprecedented except in Switzerland. But it is not merely to the faith of the Western Americans in the people that their introduction is due. Quite as much must be ascribed to the want of faith in the legislatures of states and cities, which are deemed too liable to be influenced by selfish corporations.

IV.—*The Federal System.*

§ 13. When, in 1776, the thirteen colonies threw off their allegiance to the British Crown and took the title of states, they proceeded to unite themselves in a league by the Articles of Confederation of 1781. This scheme of union proved defective, for its central authority, an assembly called Congress, was hopelessly weak. It had neither an executive nor a judiciary, nor had it proper means of coercing a recalcitrant state. Its weakness became so apparent, especially after the pressure of the war with Great Britain had been removed, that the opinion of the wisest men called for a closer and more effective union. Thus the present Constitution was drafted by a convention in 1787, was ratified by nine states (the prescribed number) in 1788, and was set to work under George Washington as first president in 1789.

The Federal Constitution.

§ 14. The Constitution is a document of the first importance in the history of the world, because it has not only determined the course of events in the American Republic, but has also influenced, or become a model for, other constitutions, such as those of Switzerland (1848 and 1874), Canada (1867), Australia (1900), besides Mexico and the numerous republics of South and Central America. It was in substance a compromise effected between those who wished for a centralized government and those who desired to leave very wide powers to the component states; and many subsequent difficulties arose from the omission to settle certain points, and from the somewhat vague language in which other points were referred to. Of these omissions and points left vague, some were inevitable, because an agreement could not have been reached, some were due to the impossibility of foreseeing what difficulties the future would bring with it. But they were, considering the conditions under which the instrument was framed, comparatively few, and the Constitution, when one regards it as a piece of drafting, deserves the admiration which it has received from nearly all American and most foreign critics. It is, on the whole, admirably clear, definite and concise, probably superior in point of technique to all the documents since framed on its model.

As respects substance, the Constitution, being enacted by and expressing the will of the people, who are the ultimate source of political power, is the supreme law of the land over the whole Union, entitled to prevail over all laws passed by Congress, the legislature which it creates, as well as over all state constitutions and all state laws. It can be altered only by the people, in manner to be hereafter mentioned. It is a comparatively short document, and consists of seven articles, subdivided into sections. Art. I. deals with the Federal legislature, its structure and powers, and imposes certain restrictions upon the states. Art. II. provides for the election of an executive head, the president, and assigns certain powers and duties to him. Art. III. treats of the judicial power, defining its range and the mode of its exercise. Arts. IV., V. and VI. contain certain miscellaneous provisions, including those which regulate the mode of amendment. Two alternative methods of proposing amendments and also two of passing them are recognized. They may be proposed either by a two-thirds vote in each house of Congress, or by a convention called by Congress on the application of the legislatures of two-thirds of the states. They may be passed either by the legislatures of three-fourths of the states, or by conventions in three-fourths of the states. Congress has in every instance preferred the method of itself proposing amendments and the method of submitting them to the state legislatures for ratification.

The provisions of the Constitution, which is later in date than the creation of the original states, and presupposes the existence and activity of those communities, include two sets of matters, which must be considered separately—(*a*) the Federal system, *i.e.* the relations of the national government to the states; and (*b*) the structure of the national government itself.

Distribution of Powers between the Nation and the State.

§ 15. In the determination and allotment of the rights and powers of the national government on one side and of the states on the other, a determination which is the foundation of every federal system, the American Constitution proceeds upon these principles:—

1. No powers are expressly allotted to the states, because the states are contemplated as continuing to enjoy those pre-existing powers which they have by their own right, and not as devolved upon them by the nation.

2. The powers allotted to the national government are those, and those only, which are required for the purposes of the collective life of the nation, *i.e.* (*a*) powers which relate to its action in the international sphere; and (*b*) powers which can be exercised within the Union more efficiently and more to the benefit of the people by one central government than by a number of separate governments.

3. All powers which are not expressly allotted to the national government are left to the states, unless specially forbidden to be exercised by the latter, *i.e.* powers not specifically referred to remain with the states, and if the national government wishes to claim any particular power, it must show affirmatively that that power has been granted to it by the Constitution. [This principle has been followed in the Constitution of Australia, but not in that of Canada.]

The powers given to the national government may be described as those which subserve purposes of common national utility.[1] They are the following (see Const. art. I. § 8):—

To impose and collect taxes, which must be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate foreign and inter-state commerce;

To establish a uniform rule of naturalization and a uniform bankruptcy law;

To coin money and fix the standard of weights and measures;

To establish post offices and post roads;

To secure exclusive rights for limited time by granting patents and copyrights;

To constitute tribunals inferior to the Supreme Court;

To declare war, and regulate captures on land and water;

To raise and maintain an army and a navy;

To provide for calling out the militia, for organizing and arming them, and for governing such part of them as may be in the actual service of the United States;

To exercise exclusive jurisdiction in the area selected for the seat of the national government and over spots acquired for military or naval purposes;

To make all laws necessary for carrying out the above powers (including laws punishing such offences as fall within Federal jurisdiction as being transgressions of Federal law);

To pass laws protecting citizens of the United States against unjust or discriminating legislation by any state (amendments xiii. and xiv.).

Powers withheld from the National Government.

§ 16. The national government is, however, interdicted from using these powers in certain directions by the following prohibitions (art. I. § 9, and first ten amendments): It may not suspend the writ of habeas corpus (except in time of war or public danger) or pass a bill of attainder or an *ex post facto* law; give any state a commercial preference over another; grant any title of nobility; establish or prohibit any religion, or impose any religious test as a condition of holding office; abridge the freedom of speaking or writing, or of public meeting, or of bearing arms; try any person for certain offences except on the presentment of a grand jury, or otherwise than by a jury of his state and district; decide any common law action where the value in dispute exceeds $20 except by a jury.

Although prima facie all powers not given to the national government remain with the states, the latter are debarred from some powers. No state may (art I. § 10, and amendments xiii., xiv. and xv.) make any treaty or alliance; coin money or make anything, save gold and silver coin, a legal tender; pass any bill of attainder or *ex post facto* law, or law impairing the obligation of contracts; have any but a republican form of government; grant any title of nobility; maintain slavery; abridge the privileges of any citizen of the United States, or deny to him the right of voting on account of race, colour or previous condition of servitude; deprive any person of life, liberty or property without due process of law; deny to any person the equal protection of the laws.

There are also certain powers which, though not absolutely withdrawn from the states, can be exercised only with the consent of the national legislature, viz. those of laying duties on exports or imports, keeping troops or war-ships in time of peace, entering into agreements with another state or foreign power, engaging in war unless invaded. And it may be added that there are certain powers which, since they do not lie within the province of the national government, and have been refused to the states, are said to be "reserved to the people." This expression means that it is only the people who can confer them and direct them to be exercised. Should the people wish to confer them, they would have to do so by way of amending the Constitution; and herein lies a remarkable difference between the American system on the one hand and those of some European countries on the other, which, although they have created rigid constitutions, do not expressly debar the legislature from using any and every power of government.

Relations of the National Government to the States.

§ 17. The aim of those who framed the Constitution was to avoid friction between the state governments and the Federal government by rendering their respective spheres of action as separate and distinct as possible. They saw that the less contact the less danger of collision. Their wish was to keep the two mechanisms as independent of each other as was compatible with the still higher need of subordinating, for national purposes, the state to the central government.

Nevertheless there are, as was unavoidable, certain points of contact between the two, the chief of which are the following:—

The Constitution requires each state government to direct the choice of, and accredit to the seat of the national government, two senators and so many representatives as the state is (in respect of its population) entitled to send; to provide for the election, meeting and voting of presidential electors in each state, and to transmit their votes to the national capital; to organize and arm the militia forces of the state, which, when duly summoned by the national government for active service, are placed under the command of the president.

Besides these direct services imposed upon the states, each state is of course practically limited in its legislative and executive action by the power of the Federal judiciary (in the exercise of its function of interpreting the Constitution) to declare invalid laws passed or acts done inconsistent with the Federal Constitution, or with statutes passed by the Federal legislature within the scope of its authority under the Constitution.

So, too, when a subject, such as bankruptcy, is one on which a state may legislate in the absence of legislation by Congress, the state law is valid only so long as Congress does not legislate.

Finally, another point of contact exists in the right of a state to call upon the national government to protect it against invasion or domestic violence. This right has been several

[1] As to the scheme and working of the Federal government in its relation to the states, see *American Commonwealth*, chs. xxvii.–xxx.

times exerted. The national government is also bound to guarantee to every state a republican form of government. (See *American Commonwealth*, ch. xxviii.)

§ 18. It is a fundamental principle of the American system that the national government possesses a direct and immediate authority over all its citizens, quite irrespective of their allegiance and duty to their own state. This authority corresponds to and is coextensive with the sphere of the Federal government. So far as the functions of that government extend, it acts upon the citizens not through the states, but as of its own right and by its own officers. Beyond that sphere its authority stops, and state authority, unless inhibited by the Federal Constitution, begins. But Federal authority is always entitled to prevail, as against a state legislature or officer, in all matters specifically allotted to it; and in these its power of direct action has two great advantages. It makes the citizen recognize his allegiance to the power which represents the unity of the nation; and it avoids the necessity of calling upon the state to enforce obedience to Federal authority, for a state might possibly be weak or dilatory, or even itself inclined to disobedience. Thus the indirect taxes of customs and excise which the Federal government imposes are levied by Federal custom-house collectors and excisemen, and the judgments of Federal courts are carried out by United States marshals distributed over the country. Nothing has done more to give cohesion to the American Federal system than the direct action of the Federal executive and judiciary.

Direct Authority of the National Government over the Citizens of the States.

V.—*The Federal Government.*

§ 19. The Federal or national government was created *de novo* by the Constitution of 1787–1789. It was really a new creation rather than a continuation of the feeble organization of the pre-existing Confederation. But the principles on which it was constructed were old principles, and most of its features were drawn from the state governments as they then existed. These states themselves had been developed out of the previous colonial governments, and both they and the national government have owed something to the example of the British Constitution, which had suggested the division of the legislature into two branches and the independent position of the judiciary. It was, however, mainly from the state constitutions, and not from the arrangements prevailing in Great Britain or in any other country, that the men of the convention of 1787 drew their ideas and precedents.

Following what was then deemed a fundamental maxim of political science, they divided the government into three departments, the legislative, the executive and the judicial, and sought to keep each of these as far as possible detached from and independent of the other two.

In 1787 all the states but three had bicameral legislatures—it was therefore natural that the new national government should follow this example, not to add that the division into two branches seems calculated to reduce the chances of reckless haste, and to increase the chances of finding wisdom in a multitude of counsellors. There was, however, another reason. Much controversy had raged over the conflicting principles of the equal representation of states and of representation on the basis of numbers, the larger states advocating the latter, the smaller states the former principle; and those who made themselves champions of the rights of the states professed to dread the tyrannical power which an assembly representing population might exert. The adoption of a bicameral system made it possible to give due recognition to both principles. One house, the Senate, contains the representatives of the states, every state sending two; the other, the House of Representatives, contains members elected on a basis of population. The two taken together are called Congress, and form the national legislature of the United States.

The Federal Legislature.

§ 20. The House of Representatives is composed of members elected by popular vote in each of the various states, the representation of each state being in proportion to its population. Each state is at liberty under the Constitution to adopt either the "general ticket" system, *i.e.* the plan of electing all its members by one vote over the whole state, or to elect them in one-membered districts (the "district system"). The system of single-member districts now prevails almost everywhere. (Pennsylvania, however, has two representatives elected at large from the entire state, and there have been other similar instances.) The number of members in the house was originally 65, but it has steadily increased until, in December 1910, there were 398. Besides the full members, each of the Territories is allowed to send a delegate, who has, however, no vote. The electoral franchise on which the house is elected is for each state the same as that by which, under the provisions of the state constitution, the members of the more numerous branch of the state legislature are chosen. Originally franchises varied much in different states, but for many years prior to 1890 what was practically manhood suffrage prevailed in nearly all of the states. In that year and since, not a few of the southern states have introduced restrictions which tend to exclude the bulk of the coloured population (see *ante*, § 5). It has already been observed that paupers and convicted criminals are excluded in many states, illiterates in some states. Every member must reside in the state which sends him, and custom, rarely broken, requires that he should reside even in the district which he represents. This habit restricts the field of choice and has operated unfavourably on the political life of the nation.

House of Representatives.

The House of Representatives is chosen for two years, the terms of all the members expiring together. The election of a new house takes place in November[1] of the even years (*i.e.* 1910, 1912, &c.). Members enter on their term of service in the March following, but the first regular session does not begin until the following December, or more than a year after the election. In fact, the old house holds its second regular session of three months after the new house has been elected. The rules are very complicated, and considerably limit the power of debate. A remedy against obstruction has been found in a system of closure called the "previous question." Speeches are limited to one hour, and may be confined in committee of the whole house to five minutes. There is comparatively little good debating in the European sense of the term, and this is due partly to the great size of the hall, partly to the system of legislation by committees.

The organization of the house is entirely different from that of the British House of Commons or of most assemblies on the European continent. The ministers of the president do not sit, and since there are thus no officials to undertake the leadership of the majority and conduct business, legislative work is shaped and directed by a number of committees in each house. Every bill when introduced is referred to some committee, and each bill comes up for consideration by the whole house on the report of the committee which has dealt with it. There were in 1910 62 regular or standing committees in the House of Representatives, each consisting of from 3 to 20 members. The most important committees are the following: ways and means, rules, elections, appropriations (with several committees for different branches of public expenditure), rivers and harbours, banking and currency, and foreign affairs. Each committee has complete control of all bills referred to it, and nineteen-twentieths of the bills introduced meet their death by the failure of the committee to take action on them. The bills taken up for action are debated and freely amended by the committees, and sometimes public hearings are held. The committees on the expenditure of the various government departments conduct minute investigations into the administration of each. A bill, as finally agreed on by a committee, is reported to the house, and when taken up for action the fate of most bills is decided by an hour's discussion, opened by the member of the committee making the report. The

The Committee System.

[1] In June in Oregon; in September in Maine and Vermont.

more important measures, including taxation and appropriation bills, receive genuine discussion by the house at large, through special orders submitted by the committee on rules. Of the enormous number of bills brought in very few pass.

The unifying force of this complicated system of committee legislation is the Speaker of the House of Representatives. Like the Speaker of the British House of Commons, he is primarily the presiding official, but the character of his office has become different from that of the impartial moderator of the British house. The American Speaker, who of course has a vote like other members, always belongs to the party which commands a majority, and is, indeed, virtually the leader of the majority party in the House of Representatives. He resembles in some respects a European prime minister, and is second only to the president in political importance. His power is derived from three main sources. He appoints the members of nearly all committees, he chooses the chairman of each, and he directs the reference of bills to the various committees. Of the committee on rules, which practically determines the order in which important measures come before the house, he was formerly chairman, and he had the power of appointing the committee; but on the 19th of March 1910, the house passed a resolution which increased the membership of this committee from 5 to 10, excluded the Speaker, and transferred the appointments to the house. As presiding officer the Speaker exercises a right of discrimination between members rising to speak in debate, and can thus advance or retard the progress of a measure. He is elected by the House of Representatives at its first session for the whole Congress, and his election is regularly carried by a strict party vote.

The Speaker.

§ 21. The Senate in 1910 consisted of 92 members, two persons deputed from each state, be it great or small (New York with 9,100,000 population and Nevada with 81,875 having the same representation), who must be inhabitants of that state, and at least thirty years of age. They are elected by the legislature of their state for six years, and are re-eligible. It used to be supposed by many Europeans, following Tocqueville, that this method of election was the cause of the (former) superiority of the senators to members of the House. This was an error, the true reason being that able men preferred a seat in the Senate owing to its larger powers and longer term. One-third retire every two years, so that the old members are always twice as numerous as the new members, and the body has been continuous ever since its first creation. Senators are re-elected more frequently than members of the House, so there is always a considerable proportion of men of long service and mature experience.

The Senate.

There has long been a demand for an amendment to the Constitution which should vest the election of senators in the peoples of the several states, and more than one-half of the state legislatures have at one time or another passed resolutions in favour of the change. Within the last few years the object desired has been practically attained in a few states by provisions they have introduced for taking a popular vote as to the person whom the legislature ought to elect, the latter being expected to defer to the popular will.

The vice-president of the United States is *ex officio* presiding officer of the Senate, and this is his only active function in the government. He has, however, no vote in the Senate, except a casting vote when the numbers are equally divided, and his authority on questions of order is very limited.

The methods of procedure in the Senate are somewhat different from those in the House of Representatives. There is a similar committee system, but the Senate committees and their chairmen are chosen, not by the presiding officer, but by the Senate itself voting by ballot. Practically they are selected by caucuses of the majority and minority parties. The Senate rules have no provision for the closure of debate, nor any limitation on the length either of a debate or of a speech. For the consideration of some classes of business the Senate goes into executive or secret session, although what is done at this session usually leaks out, and finds its way to the public through the press.

The functions of the Senate fall into three classes—legislative, executive and judicial. In legislative matters its powers are identical with those of the House of Representatives, with the single restriction that bills for raising revenue must originate in the popular assembly. In practice, too, the Senate is at least as influential in legislation as the House. Disagreements, which are frequent, are usually settled in conference, and in these the Senate is apt to get the better of its antagonist. Serious deadlocks are of comparatively rare occurrence.

The executive functions of the Senate are: (1) To approve or disapprove the president's nominations of Federal officers, including judges, ministers of state and ambassadors; (2) to approve, by a majority of two-thirds of those present, of treaties submitted by the president. Through the latter power the Senate secures a general control over foreign policy. Its approval is necessary to any important action, and in general the president finds it advisable to keep the leaders of the senatorial majority, and in particular the Senate committee on foreign relations, informed of pending negotiations. Foreign governments often complain of this power of the Senate, because it prevents them from being able to rely upon the carrying out of arrangments they have made with the executive; but as the president is not responsible to Congress and is irremovable (except by impeachment) during his term of office, there would be objections to giving him an unqualified treaty-making authority. Through the power of confirming or rejecting the president's nominations to office, the senators of the president's party are able to influence a large amount of patronage. This sort of " dual control " works with less friction and delay than might have been expected, but better appointments would probably be secured if responsibility were more fully and more clearly fixed on the president alone, though there would no doubt be a risk that the president might make a serious error.

The judicial function of the Senate is to sit as a high court for the trial of persons impeached by the House of Representatives, a vote of two-thirds of those present being needed for conviction. There have been eight cases of impeachment. The most important was that of President Johnson, whose conviction failed by one vote—35 to 19. Five of the other seven cases also ended in acquittal, one for want of jurisdiction,[1] and one by the resignation of the official before the impeachment was preferred in the Senate. Two Federal judges were many years ago thus deprived of office, impeachment being the only process by which a Federal judge can be removed.
